School & THE WORLD.

A STORY OF SCHOOL AND CITY LIFE.

By PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER I.

A HOT, drowsy afternoon, time 4.15 p.m. All the boys except the head form are out in the gravel playground, drilling under the martial eye of Sergeant Pocock. The happy boys who in virtue of their position are respited, are lounging about the house. They feel it is uncommonly hard they may not go into the grounds, but that they are forbidden to do. It would be extra torture for the amateur privates if they could see their companions lying

at ease in the shade whilst they were marching and counter marching in the broiling sun.

There is one exception to those who are respite: Soady is in the little second-floor class-room known as the music-room. Its furniture consists of the usual forms and cupboard with a piano in addition. There is no music-stool: the musician has to drag a form across the room and sit straddle-wise on it.

Up and down the old piano go Soady's thick fingers. He is practising scales and does not find it very amusing.

"One, two, three, four," he counts monotonously, as he travels from the jangling bass to the thin, wiry treble. He goes placidly on till he finds his "three, four" come where his "one, two" ought to be, then again he starts from the bottom A. Every now and then there is a hitch, as the third finger gets out of order or sticks close to the fourth. Soady finds his third finger singularly disobedient; it has a lack of independence. He pounds away perseveringly, but half wishes he were out in the playground with the school, even although there he must obey the strident-voiced sergeant, whose "Form fours! march!" he can every now and then hear through the open windows.

He is not the only one who finds his music a nuisance. There is Ferguson in the class-room below the music-room trying hard to get a nap.

"I wish that beggar Soady would shut up his everlasting scales," he mutters, angrily, to Lang, who is reading a story.

"Yes," assents the other, "he never seems to get any better: he makes just the same mistakes as he did when he began."

"And the worst of it is, one can't help listening for them," said Ferguson. "It's wearing my nerves out: he's a nuisance to the neighbourhood. And he's got no more idea of music than a cow. What on earth he learns for is more than I can make out."

There was a pause in the music.

"He's going to play Auld Lang Syne now," continued Ferguson. "I can't stand that, I'm going up to stop him: he's taken all the sleep out of me. I mean to cut the strings of that old rattle-trap one of these days."

As he predicted, the strain of Auld Lang Syne came floating through the open window; it was an arrangement in two parts and singularly irritating. Ferguson got up, and announcing that he was going to make "that young Mozart shut up," strode through the schoolroom, several of the boys there following him to see the fun.

There was not much to see. Soady heard footsteps up the stairs and promptly locked the door. When Ferguson kicked it the only response was "Auld Lang Syne" through the key-hole.

"You Soady there," shouted Ferguson, "if you don't shut up your row on that old domino box I'll—"

"You hook it," was the only response; "I'm practising."

The boys slowly tumbled down the narrow stairs again, feeling that they had been sold. Ferguson thought of storming Soady's stronghold by shying pebbles through the bottom part of the window, which was open; but it was too risky a shot to be attempted without great pro-

vocation. So he retreated in great wrath and curled himself up in a corner of the schoolroom, as far as possible from the instrument of torture overhead.

Soady after a time became tired. His fingers were sticky and would not work, so he left his perch to stretch his limbs. He strolled to the window and looked out. There was not much of an immediate view. He could see the "quad" of the three-sided quadrangle; over the wall on the south the trees were gently swaying, beyond them could be caught a glimpse of the distant hills. His gaze wandered back from them to the nearer objects.

At the farther corner of the "quad" was the coach-house, now turned into a store-room for all the miscellaneous effects of the boys which were too bulky to be stored in desks or boxes. Those who wished had boxes or lockers in this Rummage-room, as the disused coach-house was universally called. The upper form made but little use of it, as they had a sort of study of their own.

As Soady gazed idly out of his little window he saw Lang cross the quadrangle and open the door of the Rummage-room. He left it wide open after him. From curiosity Soady watched him. He only lifted down a long box, in which cricketing apparatus was kept, took out a ball, replaced the box, and came whistling out into the open air again, shutting the door behind him.

"Nothing remarkable about that," so Soady thought. It was scarcely worth while looking out of window any more if that was all that was to be seen. He sauntered back to his piano, and was just going to recommence his onslaught, when some one tried to open the door.

"No, you don't!" muttered Soady, starting his melody.

"Open the door!" cried an imperious voice.

In two strides Soady was across the room.

"What have you locked yourself in for?" asked Mr. Pickering.

"Didn't want to be interrupted, sir," was the reply.

"Have you seen Lang?" asked the master. "He isn't in the schoolroom; I thought he might be up here."

"I saw him come out of the Rummage-room a minute ago, sir; he came in at the big door, so he must be in the schoolroom now."

Mr. Pickering went downstairs again, and, as Soady anticipated, found the boy he was in search of.

"Lang, I want my Todhunter's Algebra that I lent you."

"Here it is, sir," said Lang, handing him the volume from his desk.

"Thank you. You can have it again to-morrow."

"Thank you, sir."

Mr. Pickering left the room with the book under his arm. Lang settled down to read again as Soady began once more to practise. Little did either of them imagine that the brief interval during which the musician had listlessly gazed out of the window was the most important part of the day to at least one of them.

(To be continued.)

FROM THE COBBLER'S STALL TO FAME.

WHAT a wonderful number of distinguished men have worked in early life at the cobbler's stall! In Mr. W. E. Winks's interesting book on "Illustrious Shoemakers" we have sketches of over fifty knights of the leathern apron who have risen to eminence, and these by no means exhaust the list that will readily occur to lovers of biography.

We have, first, Kit Mings, the famous admiral who beat the Spanish and the Dutch, and who fell in the four days' battle off the Foreland, where he led the van and fought his ship for half an hour after he had received a musket ball in his throat. His crew, according to Macaulay, "followed his corpse to the grave, weeping and vowing vengeance." He had forsaken his shoemender's bench to become a cabin-boy; his cabin-boy was Sir John Narborough; and Narborough's cabin-boy was Sir Cloudesley Shovel, the other cobbler lad who became an admiral, and the story of whose life we have already told in the columns of the BOY'S OWN PAPER.

We have, of course, good George Fox, the founder of the Society of Friends, and Samuel Drew, the "self-taught Cornishman," who began life as a buddle-boy in a Cornish mine, and wrote his first books on the bellows on his knees as he sat by the kitchen fire—books which have given him his fame as one of the foremost metaphysicians of his country. We have Robert Kitto, the Biblical scholar; John Thorp; Samuel Bradburn, the Wesleyan Demosthenes, who for forty years was the ablest public speaker the denomination possessed; and the eloquent William Huntingdon, who after trying his hand as ostler, gardener, cobbler, and coalheaver, gave himself his own degree of s.s., and "fairly electrified his audiences into salvation."

We have Dr. Robert Morrison, the pioneer of modern missions in China, and Dr. William Carey, "only a cobbler," who translated the Bible into Bengali and Hindustani, and from Serampore laid the true foundation of the evangelisation of India.

We have James Lackington, the bookseller, the "Sutor ultra crepidam feliciter ansus," the shoemaker who happily abandoned his last, and William Gifford, the satirist, the first editor of the "Quarterly Review." We have Richard Castell, "ye cocke of Westminster," the real founder of the Bluecoat School; and Buch, the founder of the sons of St. Crispin. We have Jacob Boehmen, the mystic, the favourite of all deep thinkers; among the artists we have Capellini, Brizzio, and De Jong; among the politicians we have Thomas Cooper, George Odger, Thomas Hardy, and Henry Wilson of Natick; and among the poets we have Robert Bloomfield, the Suffolk lad who wrote the "Farmer's Boy," and J. G. Whittier; and among the minor stars Woodhouse, Bennet of Wood-

stock, Richard Savage, "the unfortunate;" Oliver, the hymn-writer; Blacket, the "son of sorrow;" Holcroft, the dramatist; Foster, Johnstone, Nichol, Deolin, and Gavin Wilson; Temperance O'Neill; Younger, the fly-fisher of St. Roswell's; and, earlier than all and greater than all, the indefatigable Hans Sachs, "the nightingale of the Reformation," who by the time he was fifty-two had written and published 4,275 songs, 208 comedies and tragedies, and over 1,700 tales, dialogues, and other pieces!

A truly dazzling array of names that it would be difficult to surpass from any other trade! And a capital book has Mr. Winks made! Among his sketches, however, there is none more pleasing than that of John Pounds, the Portsmouth cobbler who did so much for the poor children of his native town, and of whom, as the real originator of ragged schools, we must here find space to give somewhat more lengthened mention.

Dr. Thomas Guthrie relates how he was first led to take an interest in ragged schools through an engraving of Pounds from a portrait by Sheaf, of Landport, who was also "an illustrious shoemaker."

It was at Chalmers's birthplace at Anstruther, described by him as "an old, obscure, decayed bough on the shore of the Firth of Forth." "Going on to the inn," he writes, "I found the room covered with pictures of shepherdesses, with their crooks, and tars in holiday attire, not very interesting. But above the chimney-piece there stood a large print more respectable than its neighbours, which a skipper, the captain of one of the few ships that trade between that town and England, had probably brought there. It represented a cobbler's room. The cobbler was there himself, spectacles on nose, an old shoe between his knees, the massive forehead and firm mouth expressing great determination of character, and below his bushy eyebrows benevolence gleamed out on a number of poor ragged boys and girls, who stood at their lessons round him. My curiosity was excited, and on the inscription I read how this man, John Pounds, a cobbler in Portsmouth, taking pity on the poor ragged children, left by ministers and magistrates and ladies and gentlemen to run the streets, had, like a good shepherd, gathered in the wretched outcasts; how he had brought them to God and the world, and how, while earning his bread by the sweat of his brow, he had rescued from misery and saved to society not less than five hundred of these children."

This genuine philanthropist was born at Portsmouth in 1766, and was the son of a sawyer. At twelve years old he was apprenticed to a shipwright, and soon afterwards fell into a dry dock, broke his thigh, and lamed himself for life. Shipwright's work being now out of the question, he took up shoemaking—or rather shoemending, for, like nearly all Mr. Winks's "Illustrious Shoemakers," he never became very great at his craft, though, unlike most of them, he did not distinguish himself by forsaking it as soon as opportunity offered.

Pounds had a natural gift for teaching, and finding that by patience he could make his jays, starlings, canaries, and other pets do the most extraordinary things, resolved to turn his gift to some better purpose. He had a sailor-brother with a large family, and he offered to take one of his children to share his humble bachelor's home. The child was a cripple—his feet turned inwards as he walked, so that he had to lift one foot over the other, and Pounds out of old shoe-soles devised an apparatus which in time brought the feet round to their proper position.

When the boy was old enough to begin to read, Pounds set about teaching him, and, thinking he would get on better if he had a companion, he went out into the street and selected a poor little homeless fellow, who, in the frost and snow, was sheltering beneath a bay window. These were the two first pupils; and, taking pleasure in his task, Pounds

gathered a few more together from the roadway, and the free school grew and grew until more than forty children were in the shop at a time.

The shop was not a large one; it was about six feet wide and six yards deep. In the centre sat the cobbler, "with his last or lapstone on his knee and other implements by his side, going on with his work, and attending at the same time to the pursuits of the whole assemblage—some of whom were reading by his side, writing from his dictation, or showing up their sums; others seated around on forms or boxes, on the floor, or on the steps of a small staircase in the rear. Although the master seemed to know where to look for each, and to maintain a due command over all, yet so small was the room, and so deficient in the usual accommodation of a school, that the scene appeared to the observer from without to be a mere crowd of children's heads and faces."

His school increased so much that he could not take all who came, and so he had to select his pupils. In doing this he had one invariable rule: he always made room for the poorest and most hopeless Arabs he could find, and was often seen following such on to the quay and tempting them with a roasted potato to come to learn. On fine days the school would run over into the street, and the better-behaved children sat crowding round the door outside. The books were second-hand ones, begged or bought cheap, and ordinary tradesmen's handbills. The writing materials were slates and pencils only; and yet with these humble tools the pupils were thoroughly well taught to read and write, and reckon as far as practice and proportion in arithmetic.

Pounds did not stop short at book-learning. The lads were instructed in tailoring and shoe-mending, and the girls were taught how to cook plain food and make the best of everything. Nothing that could render them happy and comfortable and fitted for their after-life did their master neglect. He made their playthings for them—balls, bats, cross-bows, shuttlecocks, kites, etc.—went out with them on holidays and played with them, got them gifts of tea and cake and many a treat. He remained a poor cobbler to the end of his days, and lived long enough to see them grow up and become useful and honourable members of society.

He clothed and fed them as well as taught them. In order to take them with him to worship on Sundays, he had in one corner of his room a bag filled with all sorts of clothes for girls and boys, which he had begged and

mended, and from this mysterious bag he would on Sunday mornings bring forth decent-looking garments to replace the rags and tatters worn by his poor little pupils. On Saturdays he would go round to the baker's and buy bread for the children to eat on the Sunday, gathering it into his huge leather apron; and would often be seen, when his money had all been spent, standing still with a troubled look, searching in all his pockets for a few more coppers with which to buy another loaf.

During the last years of his life many a fine manly fellow—soldier, sailor, or mechanic—would turn in at the little old shop where the cobbler was still at work among the sea of faces, and thank him with tears in his eyes for rescuing him from starvation and giving him a chance in life. And when the good man died many were the pilgrimages made to his grave by those who, homeless and friendless, had found in him a friend.

He died while still at his work of mercy. On New Year's Day, 1839, in the little room in St. Mary Street, about thirty children were waiting for their teacher and wondering what had become of him. He came at last—a corpse borne in by strange men. He had been out to beg a few pence to buy copy-books for his school, and had fallen down senseless while pleading with a friend, and died a few minutes afterwards. The terror and grief of the children were pitiful as the form of their much-loved master was set in their midst, and when they were turned away they stood crying round the door because they were not allowed within. Day after day the younger ones came and looked about the room, and not finding their teacher went away disconsolate.

"I am a disciple of John Pounds," said Lord Shaftesbury at the opening of the Coffee Tavern at Portsmouth five years ago, and many others have been proud to confess their indebtedness to one of the most genuine, single-hearted well-doers that ever lived.

His epitaph is so brief and true that it is worth reproducing.

Erected by Friends
As a memorial of esteem and respect
for

JOHN POUNDS,
Who, while earning his livelihood
By mending shoes, gratuitously educated,
And, in part, clothed and fed,
Some hundreds of poor children.
He died suddenly
On the first of January, 1839,
Aged 72 years.

Thou shalt be blessed; for they cannot recompense thee.

SKETCHES FOR LANTERN SLIDES.

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER I.—ONE FOR THE FRENCHMAN.

"Go on; I am listening."

"I have the honour to ask you for your daughter's hand."

"Alice?"

"Yes. My request seems to surprise you. Perhaps you will forgive me if I have some difficulty in understanding why it appears so strange. I am twenty-six years old; my name is Victor Cyprien; I am a mining engineer, and left the Polytechnic as second on the list. My family is honest and respected, if it is not rich. The French consul at Capetown can answer any questions about me you are likely to ask, and my friend Pharamond Barthes, the explorer, whom you—like everybody else in Griqualand—know right well, can add his testimony. I am here on a scientific mission in the name of the Academy of Sciences and the French Government. Last year I gained the Houdart prize at the Institute for my researches on the chemistry of the volcanic rocks of Auvergne. My paper on the diamantiferous basin of the Vaal, which is nearly finished, is sure of a good reception from the scientific world. When I started on my mission I was appointed Assistant-Professor at the Paris School of

Mines, and I have already engaged my rooms on the third floor at No. 104 of the Rue Université. My appointments will, during the first year, bring me in two hundred pounds. That is hardly an El Dorado, I know, but with my private work I can nearly double it. My wants being few, I have enough to be happy on. And so, Mr. Watkins, I have the honour to ask you for your daughter's hand."

From the firm, decided tone of this little speech it was easy to see that Cyprien was accustomed to go straight to the point in what he did, and to speak his mind freely.

His looks did not belie his words. They were those of a young man habitually occupied in the abstrusest problems of science, and only giving to worldly vanities the time that was absolutely necessary. All about him showed an earnest and serious disposition, while his clear, keen glance proclaimed an untroubled conscience. He was by birth a Frenchman, but he spoke English as well as if he had lived all his life beneath the British flag.

Seated in his arm-chair, with his left

leg thrust out on to a stool, and his elbow resting on the table, Mr. Watkins listened to Cyprien's speech and puffed away at his pipe. The old man wore white trousers, a blue linen jacket, and a yellow flannel shirt, and had neither waistcoat nor cravat. His huge felt hat seemed to be screwed on to his grey head, and shaded a face that was remarkably red and bloated. The red, bloated face was cut into by a bristly beard, and lighted up by two little grey eyes that spoke of anything but patience and good-nature.

As some excuse for Mr. Watkins, it may be mentioned that he was a terrible sufferer from the gout—hence his bandaged leg; and the gout in Africa, as elsewhere, is not calculated to soften the asperities of a man's character.

The scene is at Watkins Farm, in lat. 29° S., long. 25° E., on the western border of the Orange Free State, and nearly five hundred miles from Capetown. On the older maps the surrounding district bears the title of Griqualand, but for the last dozen years it has been better known as the Diamond Fields.

The parlour in which the interview is in progress is as remarkable for the luxury of some of its furniture as for the poverty of the rest. The floor is simply the natural earth, levelled and beaten flat, and this is covered here and there with thick carpets and precious furs. The walls are destitute of paper or paint, and yet they are decked with a magnificent candelabrum, and valuable weapons of various kinds hang side by side with gorgeous coloured lithographs in resplendent frames. A velvet sofa stands next to a plain deal table, such as is generally found in kitchens. Arm-chairs direct from Europe offer their arms in vain to Mr. Watkins, who is taking his ease in a solid construction of his own design. On the whole, however, the heap of objects of value, and the numerous furs—panther-skins, leopard-skins, giraffe-skins, and tiger-cat-skins—that cover nearly every article of furniture, give the room a certain air of barbarous wealth.

The ceiling shows that the house is not built in storeys; it can only boast of a ground floor. Like all the rest in the neighbourhood, its walls are of planks and clay, and its roof of corrugated iron.

It is obviously a new house. From its windows, to the right and left of it, can be seen five or six abandoned buildings of the same order of architecture, but of different ages, in various stages of decay. These are the mansions that Mr. Watkins has successively built, inhabited, and deserted as he built up his fortune, and now serve to mark the several steps of his progress to affluence.

That farthest off is a hut of sods. Next to it comes one with walls of clay. The third has walls of clay and wood. The fourth rejoices in a little zinc.

The group of buildings is situated on a gentle rise that commands the junction of the Vaal and the Modder, the two principal tributaries of the Orange. Around as far as the eye can see there stretches the bare and dreary-looking plain. The Veld, as this plain is called, has a reddish soil, dry, barren and dusty, with here and there at considerable intervals a straggling bush or a clump of thorn shrubs.

The total absence of trees is characteristic; and as there is no coal owing to the communication with the sea being so

difficult and lengthy, the only fuel for domestic purposes is that yielded by the sheep's droppings.

Through this dismal and monotonous plain there flow the two rivers with their banks so low and sloping that it is difficult to understand why the water does not break its bounds and flood the country.

Eastwards the horizon is cut by the distant outlines of two mountains, the Platberg and the Paardeberg, at whose base the dust and smoke and the little white spots of huts and tents denote a busy human colony.

It is in this Veld that the diamond mines are situated—Dutoit's Pan, New Rush, and perhaps the richest of all, Vandergraart Kopje. These dry diggings, as mines open to the sky are called, have since 1870 yielded about £16,000,000 in diamonds and precious stones. They are all close together, and can be distinctly seen with a good glass from the windows of Watkins Farm, about four miles away.

Farm, by-the-by, is rather a misnomer. There are no signs of cultivation in the neighbourhood. Like all the so-called farmers of this part of South Africa, Mr. Watkins is rather a master shepherd, an owner of flocks and herds, than an agriculturist.

But Mr. Watkins has not yet replied to the question put to him so clearly and politely by our hero. After giving himself three minutes for reflection, he decided to remove his pipe from his lips. Then he made the following observation, which would seem to be but very distantly connected with the subject at issue.

"I think we shall have a change in the weather! My gout never worried me more than it has done since this morning."

The young engineer frowned, and turned away his head for a moment. It was only by an effort that he concealed his disappointment.

"It might do you good if you were to give up your gin, Mr. Watkins," replied he, very drily, pointing to the jug on the table.

"Give up my gin! Well, that's a good 'un!" exclaimed the farmer. "Is it the gin that does it? Oh! I know what you are driving at. You mean the medicine the Lord Mayor was recommended when he had the gout. Whose was it? Abernethy's? 'If you want to be well, live on a shilling a day and earn it.' That's all very fine. But if you have to live on a shilling a day to be well, what's the use of making a fortune? Such rubbish is unworthy of a sensible man like you. So don't say any more about it. I'll do as I please. I'll eat well, drink well, and smoke a good pipe when I am worried. I have no other pleasure in this world, and you want me to give it up, do you?"

"It is a matter of no consequence," answered Cyprien; "I only dropped a hint that I thought might be of use to you. But let it pass, Mr. Watkins, if you please, and get back to the special object of my visit."

The farmer's flow of eloquence came to a sudden pause. He relapsed into silence and puffed away at his pipe.

And now the door opened, and a young lady entered carrying a glass on a salver.

And very charming she looked in her neat print dress and large white cap, such as is always worn by the ladies of

the Veld. Aged about nineteen or twenty, with singularly clear complexion, fair silky hair, pure blue eyes, and gentle thoughtful face, she was quite a picture of health, grace, and good-nature.

"Good morning, Mr. Cyprien."

"Good morning, Miss Watkins!" answered Cyprien, rising and bowing.

"I saw you come in," said Alice, "and as I know you don't care for papa's horrible gin I have brought you some orangeade, which I hope you will find to your taste."

"It is very kind of you, I am sure."

"Of course it is! Now, what do you think my ostrich Dada gobbled up this morning? The ivory ball I darn the stockings on! Yes, my ivory ball; and it is of good size, as you know. Well, that greedy Dada swallowed it as if it had been a pill. I know he will give me serious trouble some day."

As she said this the laughing look in her eyes did not betray much alarm at the anticipated sorrow. In an instant, however, there was a change. With quick intuition she noticed the constraint that her father and Cyprien felt at her presence.

"I am an intruder, I see," she said. "I am sorry I should have interrupted you, particularly as I have no time to lose. I must study my sonata before I begin to look after the dinner. I am sure no one could complain of your talkativeness to-day, gentlemen. I leave you to your conspiracies."

She had reached the door, when she turned round and gravely said, as if the subject were of the deepest importance,

"When you wish to talk about oxygen, Mr. Cyprien, I am quite prepared for you. Three times have I read over the chemical lesson you gave me to learn, and 'the gaseous, colourless, scentless, and tasteless body' has no longer any secrets from me."

And with that Miss Watkins dropped a slight curtsy and disappeared like a meteor.

A moment later the notes of an excellent piano, heard from one of the rooms at some distance from the parlour, announced that the daughter of the house was engaged in her musical exercises.

"Well, Mr. Watkins," said Cyprien, reminded of his request by this apparition—if it had been possible for him to forget it—"will you give me an answer to the question I had the honour to ask you?"

Mr. Watkins removed his pipe from the corner of his mouth, expectorated with great majesty, abruptly raised his head, and looked at the young man with the air of a grand inquisitor,

"Was it by chance that you spoke about this to her?"

"Spoke about what? to whom?"

"What you have been talking about now; my daughter."

"For whom do you take me, Mr. Wat-

"It is very kind of you, I am sure."

kins!" replied the young engineer, warmly. "I am a Frenchman, sir, and that is to say that without your consent I should never think of speaking to your daughter about marriage."

Mr. Watkins looked somewhat mollified, and his tongue seemed to move more freely.

"So much the better, my boy. I expected no less of you," answered he, in almost a cordial tone. "And now, as I can trust you, you will give me your word of honour never to speak of it in the future."

"And why, sir?"

"Because the marriage is impossible, and the best thing you can do is to drop all thoughts of it," continued the farmer.

"Mr. Cyprien, you are an honest young fellow, a perfect gentleman, an excellent chemist, a distinguished professor, and have a brilliant future; I do not doubt it at all. But you will never have my daughter, and that because I have quite different plans for her."

"But, Mr. Watkins—"

"Say no more; it is useless," interrupted the farmer. "If you were an English duke you might convince me, but you are not even an English subject, and you have just told me with perfect frankness that you have no money! Look you here; do you seriously think that, educating Alice as I have done, giving her the best masters of Victoria and Bloemfontein, I had intended to send her, as soon as she was twenty, to Paris, on the third floor at No. 104 of the Rue University, to live with a man whose language I don't even understand? Just give that a thought, and put yourself in my place. Suppose you were John Watkins, farmer and proprietor of Vander-gaart Kopje Mine, and I was Victor Cyprien, on a scientific mission to the Cape. Suppose that you here were seated

in this chair smoking your pipe; suppose that you were I and I were you. Would you for a moment think of giving me your daughter in marriage?"

"Certainly I would, Mr. Watkins," replied Cyprien, "and without the slightest hesitation if I thought you were likely to make her happy."

"Oh! ah! Well, then, you would be wrong. You would act like a man unworthy of being the owner of Vander-gaart Kopje, or rather you never would have been the owner of it! For do you think I only had to hold my hand out as it came by? Do you think I wanted neither sense nor energy when I found it out and made it my property. Well, Mr. Cyprien, the sense I showed in that affair I show and will show in every act of my life, and particularly in all that concerns my daughter. And so I say drop it. Alice will never be yours."

And at this triumphant conclusion Mr. Watkins tossed off his glass.

The young engineer was silent, and the old man continued,

"You Frenchmen are an astonishing lot! There is nothing very backward about you. You come here as if you had dropped from the moon into this out-of-the-way spot in Griqualand, call on a man who had never heard of you three months ago, and who has not set eyes on you a dozen times, and say to him, 'John Stapleton Watkins, you have a nice daughter, well educated, everywhere known as the pride of the place, and, what is anything but a drawback, the sole heiress of the richest diamond kopje in the world. I am Mr. Victor Cyprien, of Paris, an engineer with two hundred a year, and I should like you to give me your daughter, so that I can take her home and you can never hear of her for the future except by post or telegraph!' And you think that is quite

natural? I think it is consummate impudence!"

Cyprien rose, looking very pale. He picked up his hat and prepared to leave.

"Yes, consummate impudence!" continued the farmer. "No gilded pills for me. I am an Englishman of the old sort, sir. I have been poorer than you—yes, much poorer. I have tried my hand at everything. I have been a cabin-boy on a merchant ship, a buffalo hunter in Dakota, a digger in Arizona, and a shepherd in the Transvaal. I have known heat and cold and hunger and trouble. For twenty years I earned my crust by the sweat of my brow. When I married Alice's mother we hadn't enough to feed a goat on. But I worked. I never lost courage. And now I am rich and intend to profit by the fruit of my labours. I am going to keep my daughter to nurse me, to look after my gout, and to give me some music in the evening when I am tired. If she ever marries she will marry here, and she will marry some fellow who lives here, a farmer or a digger like I am, and who will not talk to me of semi-starvation in a third floor in a country that I never had the slightest desire to go near. She will marry James Hilton or some fellow of that stamp. There will be no lack of offers."

Cyprien had already reached the door.

"No animosity, my boy; I wish you no harm. I shall always be glad to see you as a tenant and a friend. We have got some people coming to dinner this evening. Will you make one?"

"No, thank you, sir," answered Cyprien, coldly. "I have my letters to write for the mail."

And he left.

"One for the Frenchman!" chuckled Mr. Watkins.

(To be continued.)

Indoor Games and Amusements.

GO-BAN.

BY HERR MEYER.

THIS game is of Japanese origin, and the name means Go = five, and Ban = board. It has, however, got gradually corrupted into "Go-bang," and thus it is now generally written.

In Japan it is played on a board of more than 300 squares, but in Europe on boards of sixty-four squares (as in chess and draughts), or on larger boards. The Japanese have schools for the study and practice of the game, and divide the players into nine classes. A late account says that at present there is no player of the highest (the ninth) class living; but one of the eighth class, named Murase (in German spelling pronounced Moo-ráh-sey), is editing a periodical, in which he publishes the theory of the openings, actual games, problems, poems, etc.

This game of Go (or game of five) is in China called Ki (= Kee), and was invented there about 2,000 years B.C. It is therefore older than chess. It was introduced into Japan about 1,100 years ago, and was there brought to higher perfection.

It is played by two persons. In Japan they use more than a hundred men on each side. If played on the chess-board, then generally one plays with twelve white men, the other with twelve black men. The aim of each player is to get five men in a line—

i.e., five of his men close together in a straight line, either in row, a file, or a diagonal. In Japan each player tries to form a chain with his men around the others, etc.

The play is carried on thus:—The players decide as to first move; afterwards they begin alternately. The first player, say White, places a man on any of the sixty-four squares, then Black places a man on any of the remaining sixty-three squares; thereupon White puts down his second man on any unoccupied square, and so on until all the twenty-four men are placed. Now the moving begins. The first player moves one of his men to any of the next unoccupied squares, but must not leap over a man, and the second player proceeds in the same manner. So the play continues until one or the other succeeds in getting five men in a line.

Thus the play consists in placing and moving. If a player be not sufficiently attentive he can lose in the first part of the game. The moving may extend from 2 or 3 to any number, according to capacity of the players.

The game requires a great deal of watching, for the "Go," or "Five," can be made in any of four directions—horizontally, vertically, or on the right and left diagonals.

There are eight lines for each of the two straight ways, and seven lines for each of the two diagonal ways; in all thirty lines. Four positions of the "five" are possible in a row or a file, and as many in each of the longest diagonals, whilst the shortest diagonal permits of only one position, so that the number of all positions is $4 \times 8 + 4 \times 8 + 2 (4 + 3 + 3 + 2 + 2 + 1 + 1) = 96$.

Many players prefer this game to draughts. It may also be played by four persons, taking partners as in "whist," when each player receives six men. Odds can be given in this game, a superior player having eleven against twelve men.

Whenever a player has three men in an open line the opponent must stop him, for should he get four, then the adversary could block him on only one end. This blocking, however, is not necessary if the second player can first make "five."

The student will learn the method of playing from the games we shall give with explanations. The system of description is the International Chess Notation, as will be shown on the frame of the diagram to follow. The letters in brackets after the moves will refer to the explanatory notes.

OUR CRICKETING GUESTS

OUR PARROTS.

R. Ward Tate writes to us from Baltrasna, Timaru, New Zealand, under date of July 7th:—"I beg to amend a statement made in the BOY'S OWN PAPER, page 335, No. 267, Vol. VI. It is there stated that *Stringops habroptilus*, the owl parrot of the colonists and the kakapo of the Maoris, has displayed a partiality for eating flesh. This is quite erroneous. The kakapo feeds exclusively on vegetable matter, chiefly on the mosses which cover the prostrate tree-trunks. It cannot fly, although it has large wings. Its flesh is good to eat, something like beef, and for this reason it is hunted down with dogs.

"The bird that does eat flesh, or rather mutton-fat, is the kea, or mountain parrot (*Nestor notabilis*). Its carnivorous propensities were first noticed on Mr. Henry Campbell's sheep station at Wanaka (Otago). It is very inquisitive as well as being destructive. Hundreds of sheep are every year killed by this bird. It settles on the back of the sheep, and with its beak cuts its way through to the kidney-fat, the only part of the animal which it eats. This it tears out, mutilating the animal to such an extent that it generally dies in consequence. I may mention that the small green parrakeet (*Platyercus Novae Zealandiae*) has developed the same taste, though it does not go so far as killing the sheep. It only pecks off the fat when the carcass is hanging on the meat gallows."

ROWING COLOURS.

In the plate of rowing ribbons issued with the part for last September, and which took some time in preparation, the colours given as those of the Bedford Grammar School are the old colours of the Modern School. The present colours of the Bedford Modern School are black and red arranged diagonally; those of the Grammar School are dark-blue and white arranged horizontally.

We are indebted to Mr. H. T. Andrews, of Magdalen, for the official list of the colours of the Oxford colleges during the current year. Exeter has red on a black hat; Magdalen, scarlet with lilies in front; Corpus, blue edged with red; Brasenose, yellow on a black hat; Keble, red, white, and blue; Pembroke, white hat with red ribbon and red binding; Hertford, red and white; New, violet cap with thin stripe of orange at the seams; St. Catherine's, crimson centre with white border edged with dark blue; Trinity, blue and white; St. John's, broad blue-and-white ribbon with badge; Christ Church, blue ribbon with cardinal's hat; Lincoln, broad dark-blue edged with light blue; Wor-

cester, black-and-white straw hat and broad pink ribbon; University, white hat trimmed and bound with blue ribbon; Balliol, white with blue and red arms; Queen's, carmine and brown; Wadham, light blue; Merton, white straw hat trimmed with a ribbon edged with red and a red cross; Oriel, two white stripes on a blue ground; Jesus, green and white and Prince of Wales's feathers.

This year's list of the Cambridge college colours gives:—St. Catherine's, claret with claret border; Cavendish, chocolate with blue border; Christ's, dark-blue with dark-blue-and-white border; Clare, black with yellow border; Corpus Christi, cherry with white border; Downing, black with magenta border; Emmanuel, cherry with blue border; Gonville and Caius, black with light-blue border; Jesus, white with red-and-black border; St. John's, scarlet with scarlet border; King's, white with violet border; Magdalene, indigo with lavender border; Pembroke, dark-blue with light-blue border; Peterhouse, blue with white border; Queen's, black with green border; Selwyn, crimson, with gold border; Sidney-Sussex, blue with red border; Trinity, First, dark-blue with dark-blue border; Trinity, Third, white with dark-blue border; Trinity Hall, white with black-and-white border; Non-Collegiate, dark-blue with old-gold border.

A DEAF AND DUMB BOY.

At a public examination in a deaf and dumb asylum a minister was asked to test the children in their knowledge of religious truth. He asked a little boy "Who made the world?" writing the question on a black board. The boy took up the chalk and wrote underneath, "In the beginning God created the heaven and the earth." The examiner then wrote, "Why did Jesus Christ come into the world?" To this the answer was given also in words of the Bible, the boy's face beaming with intelligent joy, "This is a faithful saying, and worthy of all acceptance, that Jesus Christ came into the world to save sinners." A third question changed the boy's expression of countenance. "Never shall I forget," says the narrator, who witnessed the scene, "never shall I forget the look of quiet resignation on the boy's countenance as he wrote, 'Even so, Father, for so it seemed good in Thy sight.'"

Off we go!

"ARE you ready?" Off we go,
Starting on our twelve months' race,
Not too fast, and not too slow,
We prefer a steady pace

For our object is to last
Fresh and merry to the end,
So that when the year is past
We may not have lost a friend.

Some have watched us run before,
Friends we made in days gone by;
They are with us now once more,
Time their friendship could not try.

Others too have gathered round,
Just to see how we can "move,"
And we trust they'll deem they've found
What will interesting prove.

We can't stop to make a speech,
Some would then proclaim us slow;
We just make a bow to each,
Greeting them, and—on we go.

SOMERVILLE GIBNEY.

Our New Volume.

H, happy boys! You still are young,
 You're standing on a lowly rung
 Of life's long ladder; I was there
 Some years ago, and had my share
 Of all the grief and all the joy
 Peculiar to the genus "boy."
 Were I a boy again how strange
 'Twould seem, for "all things suffer change."
 'Tis hard to fancy how, at school,
 When rainy days became the rule,
 We kept things going, for you see,
 The world then lacked its B. O. P.

All that is changed, and as we start
 Our volume with the present part,
 We're glad to know we add a joy
 To life for many a British boy.
 Lads! imitate the B. O. P.
 Resolve to do your best to be
 A joy to others, to avoid
 What can't be harmlessly enjoyed.
 To please, instruct, and guide our aim;
 Determine yours shall be the same.

ONE OF MOTHER CAREY'S CHICKENS

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "A Dunce's Disasters," "The White Rat," etc.

CHAPTER I.

"CLUCK! cluck! cluck! cluck! CLUCK!
cluck! cluck! cluck!"

From the noise the old Cochin China hen made you might have thought she was the very identical fowl which laid the golden eggs in the fable. She strutted this way and that, proclaiming her proud delight to the world in general, and to Mother Carey in particular, who was looking forward to a brood of chickens. It had been well if she had looked backward also—for she was at that moment engaged in boiling the potatoes for dinner, and, turning quickly round to peer out of window and see which of her hens was raising the triumphant hymn, she forgot all about the bucket of water, and she must needs kick it over in her excitement, thereby producing a small flood in the apartment. This disaster roused the old dame's wrath, and she gave an extra kick to the inoffensive bucket. The result was excruciating anguish to her great toe with the corn, and genuine cause for the old lady to howl in good earnest.

Mother Carey lived in a cottage adjoining the cricket-field at Highfield House. Her husband had formerly been head-gardener to Dr. Porchester; and now, having passed the time of life in which his energies were equal to the laborious requirements of that situation, he had relapsed into the less dignified position of knife-and-boot boy. As he

naively expressed it, "I've a-been in service this fifty years, and I be only a b-u-o-y after all!"

Mother Carey herself washed the socks of the young gentlemen and turned an honest penny by the produce of her poultry-yard. She had fair reason to be proud of her chickens. It was not that they were of choice extraction or imposing in numbers, for when all hands were piped at feeding time there was but an ill-assorted gathering of some twenty birds, of all shapes and sizes, from the gawky Cochin down to the dainty bantam. But by careful diet and treatment she prevailed upon them to give her a very respectable supply of eggs, and her spring chickens invariably fetched a good price, and were famous far and wide for the flavour and delicacy of their flesh.

Now, any one acquainted with the dame might have been struck by her countenance on this occasion. The habitual serenity of her face was replaced by a frown of unqualified dissatisfaction as she looked out of window and espied the old Cochin China hen craning her neck with vigorous efforts of intonation. It may have been the smarting corn on the dame's big toe; it may have been the mess of water on the floor of the kitchen. But probably the cause of her displeasure was otherwise.

That particular hen had lately developed a tendency towards deception

highly to be censured in a bird of reputable character. For three days in succession that fowl had trumpeted forth the tidings of an egg laid. Yet, although Mother Carey searched high and low, she could not discover where the canny old fowl had concealed the treasure. She had looked in the copse, in the stable, in the wood-yard, in the barn, in the out-house, in the peat-stack, in the straw-stack, and the haystack. In out-of-the-way nooks and corners had Mother Carey hunted, and all to no purpose.

There were eggs unlawfully hidden, and the henwife was justly indignant at the insolent deceit. She could not spend her day dodging the Cochin with incessant surveillance. Time was not long enough. She wished to trust her fowls—to teach them honesty and appeal to their sense of honour by treating them with confidence, and was this to be the return? Mother Carey gave a sniff and wiped her eye with a corner of her apron. It was only yesterday, when that gossiping old crony Mary Woostford called and recommended a strict watch to be set upon the movements of the culprit, that Mother C. had said, "I'd scorn the haction, marm!"

The proprietress of the poultry-yard was visibly irate against this member of her galaxy. The flash of her eye, the impetuosity of her step, betokened hot displeasure. She'd let the rascally old

fowl know, and suiting the action to the resolve, she was out in the yard in an instant armed with a mop. There was a shriek and a scurry of legs and wings, and the Cochin made rapid tracks for cover.

Mother Carey returned to her potatoes.

It behoves me to throw light upon the conduct of this hen.

Know, then, that there was a boy at Highfield whom his sponsors had christened Thomas, while his surname was Bertram. But his schoolfellows, with an eye to the exuberant development of his cheeks, called him "the Dumpling."

In the practice of nicknames we may notice a usage of classic antiquity which has defied the vicissitudes of time, and will doubtless continue to future ages. Had not Cicero's grandfather a wart on the top of his nose which got him the cognomen of "Chick-pea"? Was not Ovid conspicuous above his fellows for the size of that member, wherefore they called him "Nosey"? And the progenitor of the Scipios was doubtless tall and straight like a walking-stick. Among the celebrated "Graffiti" of Pompeii are numerous caricatures and inscriptions savouring strongly of this custom, so that if the Latin prose book is to be believed a boy named Caius was called "the Cow," and another with large eyes and a round face was known as "the Owl."

Where were we?

Talking of the Dumpling, sir.

To be sure. Well, he was a full-fleshed lad of jocund countenance and a turn for idleness, vanity, and mischief, which often got him into trouble, as it always will to the end of the chapter. But perhaps we must not be too hard upon his all-too-numerous followers, for if it was not for such boys there would be no need of schools to train and correct and drill them into shape. And if there were no schools there would be no holidays, and whatever should we do then?

Without further preamble, let me state at once that this Dumpling was simply and solely to blame for the hen's conduct which so grievously displeased Mother Carey. Yes; so prone was that youth to folly, that, not content with setting a bad example to himself and his companions, as though that were not enough, he must needs lead astray into unseemly conduct a Cochin China hen! And this is how it was.

The Christmas holidays were just over, and the Dumpling had found them hang heavy on his hands. Not being of literary tastes, he did not care for reading stories even of thrilling adventures and hairbreadth escapes. Not having a taste for the fine arts, he would not practise his scales on the pianoforte nor amuse himself with a pencil or a paint-brush. Not caring for bodily exertion, he would not even join the merry company of sliders and skaters, though the ice was in superb condition for a whole fortnight. The obesity of his carcass prevented him joining with any pleasure in games, and if he was forced by the home authorities to go to a juvenile party he would sulk in a corner and throw a chill over the festal mirth which even the warmth of his red cheeks failed to dispel.

Seeing then that these things were so, the Dumpling had cast about in those holidays for some diversion which might be congenial to his degenerate tastes, and he had been successful. His brain,

so inactive as a rule, had shown extraordinary quickness in devising a remedy for his ennui. He had taken a course of lessons in cookery. I use the word *taken* advisedly, for it cannot strictly be said that the lessons were *given*.

The cook was far from pleased at the frequent visits he paid to her domains. He would come rolling into the kitchen at any time, no matter how busy she might be. He was not unpleasant or rude in his manners. Nay, he took care to make himself agreeable to the servants. He had brought the cook a new cap with pink ribbons as a Christmas present; and he had a way with the servants which was quite irresistible. He would smile till his beady eyes twinkled and the dumplings on his cheeks became more pronounced than ever, and the housemaid, at all events, thought him a fine, handsome young fellow.

Thus he would often gain admission to the kitchen, and there inspect the culinary operations. He was specially interested in the manufacture of puddings and pies. Pie-crust he loved. You might see him with his pocket-knife scraping off the remnants of crisp brown flakes that fringed the margin of an emptied pie-dish. He would convey the morsels to his mouth and devour them with a voracity commendable in a prize pig, but not so in a boy never likely to be a prize boy in any competitive examination.

The Dumpling went back to Highfield after those Christmas holidays with fine stories of his achievements in the art of cookery. He boasted to have made mince-pies and cheese-cakes and toffee and all kinds of sweets. He would gather round him a bevy of kindred spirits and dilate upon the glories of his skill with wondrous eloquence, while his hearers licked their lips and smacked their chops, and feasted in imagination upon all the luxuries of Christmas.

"And then, you fellows, my mater one day wanted a trifle, and cook was busy, and I said I'd make it. So I got the eggs, and sugar, and sponge-cakes, and jam, and cream, and brandy, and sherry, and made such a splendid dish. The white of the eggs I flipped up into foam half a yard deep, and the strawberry jam at the bottom! Oh, it was crackey, I can tell you!"

"I should like some now, I know jolly well," said a very skinny, pale-faced boy, who looked as if he had never eaten a dinner of roast beef in his life. "I wish you'd make us one of your grand dishes, Dumpling, just to show what you can do."

"I'd make a trifle fast enough if I could only get the things; but how can a fellow get anything good at this beastly place?"

The Dumpling moved off without waiting for any one to answer his question. Most of the boys were playing football in the playground, for it was between 2 and 4 p.m. The gravel was in prime condition—hard and dry. The sun was bright, the air crisp and frosty, and of course the boys as a rule were making the most of it, playing up with that grand energy which is so delightful to watch. If boys would only throw the same determined vigour into their lessons we should have them all at the top of the class; the bottom would be No Man's Land—Ultima Thule, the other side of the Streams of Ocean.

Most of the boys were hard at play.

Only a very few were loafing about, and those were the troublesome, idle, mischievous spirits who break windows, cut the desks, pick mortar out of the walls, break rules on the sly, skulk in twos and threes behind odd corners, and generally give more unnecessary trouble than all the rest. But we cannot stop to consider these uninteresting specimens just now, for the game waxes warm round one of the goals, and who can resist the inclination to look on?

Notice that splendid young fellow with a face which one day will be a type of manly beauty, with a chest that even now makes one feel strong to look at it. That's our friend Harry Stephenson, captain of the games, the most popular boy in the school. See how he defends the goal, with his entire soul thrown into the work, rallying his side around, cheering, directing, charging, shoving his mightiest. He'll ward off defeat if any one can. But, see, that little bit of a chap has hold of the ball, with limbs as lissom as a cat's. His legs seem to flash as he runs and dodges. Why, that's—no, it can't be—yes, it is—that's his small brother, Dickey!

Who could believe it? In spite of his diminutive size he runs like a hare. What a colour he has! Why, he's the picture of health, as different as possible from what he was the last time we saw him on the platform at Ventnor Station. He's getting the ball through! He'll get a goal! Ah, no. Harry has caught him. With one arm encircled round the small body he lifts him clean off his legs, but as tenderly as is compatible with stern duty. Harry's other hand secures the ball in a trice, and depositing Dick with a laugh he punts the ball half-way down the playground, and looks round, now that the danger is past, to see that Dick is none the worse. God bless you, boys!

Hi! stop one moment, Master Puffy-cheeked Dumpling; don't go skulking out of the playground just yet. You want to get round that corner and steal off to the field to potter and loaf after some silly mischief. But do stay one moment and watch the game; for if you did, surely you could not choose but join in yourself, and perhaps dissolve some grains of superfluous fat, and raise in your unwieldy frame a glow of vigorous life which might prevent your yawning and lolling over the desk all through that Latin prose lesson which comes on at four o'clock. No, he has disappeared round the corner, and I have not the heart to follow him just now.

(To be continued.)

AN EVENING AT THE IVY.

BY THEODORE WOOD.

HERE we are at the beginning of October, with the leaves falling fast, the evenings drawing in, and everywhere signs of rapidly approaching winter. Before very many weeks have passed our net must be laid aside, collecting-boxes put away on the shelf, and we shall be obliged to content ourselves, as

far as outdoor work is concerned, with digging for pupae whenever our entomological ardour happens to burn.

Happily, however, things have not yet arrived at such a pass. We can still sally forth by day, provided that the wind and sun are in our favour, with a tolerable certainty of filling our boxes with more or less valuable captures. If we are favoured by fortune's smiles, perhaps, even a "Camberwell Beauty" or a "Queen of Spain" may reward us for our labours, while several stars of lesser magnitude may reasonably be expected to fall victims to our prowess.

Then, after darkness has set in, the treacle-pot is still far from unattractive, the gas-lamps will have many inquisitive visitors, and such flowers as those of the petunia may possibly lure a *Convolvulus Hawk-moth* or so on to destruction. But far more productive than any of these is the ivy, the blossoms of which are just now in their fullest luxuriance.

It is really a wonderful sight to see the myriads of insects which congregate upon the ivy-bloom both by day and by night. Sometimes the blossoms will be almost wholly concealed from view by hosts of Red Admirals, Peacocks, Tortoiseshells, Painted Ladies, and other sweet-loving butterflies, all of them so engrossed in sucking up the luscious juices that they may be taken between the finger and thumb before they are even aware of the presence of their captor. All the bees in the neighbourhood are sure to attend for business purposes, while wasps, hornets, flies, earwigs, bugs, beetles, and spiders

occupy every attainable corner. No sooner does one visitor leave than his place is taken by a new-comer, not a break taking place in the constant succession of guests until either the weather changes, or the flowers, drained of the last drop of their sweet juices, wither away and lose their alluring properties.

By night the scene is much the same, excepting that the butterflies, who have a wholesome dread of late hours, retire from their posts shortly before sunset, and so make room for their more dissipated relatives, the night-flying moths. And these are by no means slow to take advantage of their opportunities, for, almost before the first shades of dusk have begun to appear, pioneers arrive from all directions, and before very long the stream of visitors is so incessant that the entomologist is irresistibly reminded of the oysters who so imprudently accepted the treacherous invitation of the Walrus and the Carpenter:

"And thick and fast they came at last,
And more, and more, and more."

The ivy is once more literally besieged with insects. Generosity and the allied virtues are at a discount, for "first come, first served" is the order of the day, and a late-comer can often find place only by ousting a smaller and weaker relative from the blossom upon the juices of which he was revelling. This, as a rule, he is by no means loth to do, and very amusing squabbles are sometimes the result.

LET us now suppose that our readers are bearing us company upon one of our ivy-searching expeditions. The evening is dull and misty, but warm withal; the moon is long past the full, and does not rise until very late, and there is a very slight south-westerly breeze, so that we have every reason to congratulate ourselves upon our selection of a favourable evening. In half an hour more it will be time to set to work, and as we have a mile and a half to walk before arriving at the happy hunting-grounds we deem it fully time to make a start.

Nets we carry, of course, for moths are cunning, and often allow themselves to drop to the ground as soon as the light from the lantern falls upon them. It is generally the good moths, somehow, which resort to such tactics, for the members of the common herd seem to be perfectly aware of their own exceeding worthlessness, and remain quietly in their places, regarding the collector with an impudent stare which is very amusing.

Equally, of course, our pockets bulge with pill-boxes of various sizes, some nested for the sake of compactness, and others ready for immediate use. Then there is the lantern, duly filled and trimmed, a box of matches, and a few odds and ends, such as pins, etc., in case of emergencies. Thus equipped, we commence our journey, and arrive at our destination just as dusk is beginning to set in.

And a splendid collecting-ground it is. A high wooden fence, nearly half a mile in length, which borders a well-timbered park, is covered from end to end with the most luxuriant of ivy, which just now is literally laden with blossom. Thick masses of the flowers hang within easy reach, and, the height of the fence notwithstanding, there are but few situations in which a moth could rest without being easily visible. Altogether, we could hardly find a more promising locality, and we begin our preparations for the evening's campaign with hope rising high in our breasts. For does not the rare Dotted Chestnut (*Dasympa rubiginosa*) occasionally visit the blossom of the ivy? And have not fortunate collectors met with even the Red-headed Chestnut (*Glaea erythrocephala*) itself, enjoying a convivial evening with its commoner kin?

(To be continued.)

CHESS.

(Continued from vol. VI., page 822.)

Problem No. 85.

By Mrs. SOPHIE SCHETT.

White to play, and mate in three (3) moves.

BLINDFOLD GAME.

This game was lately played between Messrs. Palmer and Meyer, who were walking in a park, without chess-board or men, and they merely told one another the moves. The game lasted one hour and ten minutes.

WHITE.

To Chess Correspondents.

J. S. and S. S.—Other correspondents agree with you that No. 81 is "one of the prettiest problems ever composed."

"OMEGA."—Your solution to No. 77 is correct, and it can also be solved by 1, B x P.

H. M. (Bath.)—Solution and remarks agreeable.

J. S.—Your suggestion that Petroff in our last game might have played 11,—Kt—B 4 (ch.). 12, K—B4, B—K6 (ch.). 13, K × Kt, Q × Kt (ch.), etc., would have led to inferior play.

OUR OPEN COLUMN.

A BRAVE LAD.

A "Spectator" writes from North London under date of July 19th: "At a fire that occurred last night at a mantle shop in the Upper Street, Islington, Frederick L. Graves, aged 15, who has been a subscriber to the B. O. P. from the first number, shortly after the outbreak scaled the wall at the back of the premises,

and, climbing in at a window, succeeded in rescuing two children who were in bed, the room being filled with dense smoke, and, bringing them down in safety, handed them over the wall to a neighbour. He then returned to an upper room, where he found another child, but a fireman arriving he gave him into his care." We are constantly receiving testimony of this kind, and need hardly say, therefore, how proud we are of "our boys."

WORDS OF CHEER.

The Rev. JOHN DEACON, head master of St. George's Grammar School, and Assistant-Curate at St. George's Cathedral, Cape Town, South Africa, writes: "I need hardly bear testimony to the delight which your most valuable and instructive paper affords in this far-off land. My schoolboys—and I do not hesitate to say myself also—read it with unabated interest. The healthy tone of its writings, combined as they are with such manly and Christian lessons, are most useful,

especially to South African boys, who, owing perhaps to the climate and other circumstances, lack to a certain extent that energy, application, and, I am sorry to say, 'schoolboy honour' which perhaps distinguishes the true English schoolboy. Speaking for myself, I am very thankful for the help which I feel convinced the BOY'S OWN PAPER renders us in the moral and intellectual training of our boys."

Our Portrait Gallery.

WE commence this week a series of carefully-executed portraits of the Heads of our great Public Schools. Dr. Hornby, of Eton, is engraved from a photograph by Messrs. Hills and Saunders, Eton; Dr. Butler, of Harrow, from a photograph by Mr. Samuel A. Walker, 230, Regent Street, London, W.; Dr. Haig Brown, of the Charterhouse, and Dr. Abbott, of the City of London School, from photographs by Messrs. Elliott and Fry, 55, Baker Street, London, W.

FISHING FOR THE MONTH.

OCTOBER.

THERE are probably more eels caught in October in the United Kingdom than during any other month in the year. On the Itchen, even, it is not at all uncommon for the water-keepers to get a hundred-weight of these fish in the course of one dark and damp night in each net, and I myself have frequently done this on the same and other rivers. It is not, however, in reference to netting that I wish to speak now. This is also the best month for catching eels with a hook and line on dark nights—for being a nocturnal fish that is your best time.

Fortunately, as the weather is frequently wet and rough, it is not at all necessary for you to be up, but you can retire, after setting your baits, till daylight. I now refer specially to eel-lining, and these are the materials. Procure a ball of long cord of the thickness of a crow-quill, some twine or water-cord—the latter is better, because stronger—and a hundred eyed eel-hooks. Soak both the cords in warm water, this removes the dressing which every new rope or cord invariably contains; then while wet stretch both out between nails as tightly as you can draw without actually straining them. When dry they are ready for use. The long cord can be cut up in lengths of about fifteen yards, and is to form the main line; the water-cord or twine is cut in two-foot lengths. Now tie your hooks with a secure knot to the two-foot lengths of string, and let a knot be also tied at the other end of each length, so that it may not become unravelled. Stretch

your fifteen-yard lengths between posts, so that they hang clear of everything, and proceed to tie on your hook-lines at intervals of three feet, so that they drop at right angles to the main line. Worms well scoured will procure you most sport, for I do not think an eel ever passes by a lob-worm without taking it. To set the line a boat is best. A couple of bricks are necessary, one at each end, to sink it; and if you are not used to eel-lining and how to mark your spot of laying, a piece of twine must be attached to one brick, and a cork tied on, that it may mark the place where the line is as by a buoy. This is a good plan and saves trouble, though it occupies time, and is therefore not so useful to the professional fisherman, whose aim is to get as many lines in as possible before dark. One can by use pretty correctly remember the spot where the line lies; and the grapnel, which is made like a large triplet hook, soon brings up the line.

By-the-by, shall I tell you how to mark in your memory the exact position of a hole or swim in a large lake, or in fact on a river, though the method is not so much required because of the nearer approach of the banks? This is how. Suppose you are in the middle or thereabouts of the lake; your boat is stationary, or you must make it so. Now turn your face in one direction, and mentally notice two objects which stand on the bank one behind the other—say a tree and a church tower; let the tree be close to the bank and the church some distance; the only absolute necessity is

that the tree is in a line with the church—i.e., partly hides it in a straight line. Therefore, a line drawn from yourself would pass through the middle of the tree and church. Do you understand? If not, read this carefully over again. Now you do; very well! Having made the mental note I spoke of, turn exactly half round either right or left, and do precisely the same with two other objects on your left or right, which is most convenient. Now you have mastered a little bit of mathematics, of which you were, perhaps, hardly aware. A line drawn through these two sets of objects converges to a point exactly where you stand, and of course exactly over where you wish to come again. The application of it is very easy. You start next day, or a month hence, and get two of your objects in a line with you; all you have to do now is to advance or recede till the other two objects are also in a line with you, on your right or left, whichever it may be. This is how sea fishermen know their fishing grounds so accurately when fishing off shore.

To return to eel-fishing. There is another method or two for these fish, which is very effective, though the laying of lines is undoubtedly the best plan. First there is "snigling." The usual process with worms is cruel, I therefore give another way of doing the same kind of fishing without pain to anything except the eel. Get the fresh entrails of any small animal, such as chicken, rabbit, etc., and whilst perfectly fresh

thread them on a line. The result will not be so good, but you will have the satisfaction of knowing that your bait is not alive and suffering. The same bait may be adapted to "bobbing" for eels. This "bobbing" consists of a needle tied or whipped on a string, so that it hangs crosswise; the end of this string is attached to your button, allowing a couple of yards or so to hang free between it and the needle. On the top of a stoutish stick tie a piece of stiff wire, curved into nearly a half-circle, and your apparatus is complete. Take your bait and thrust the needle into it, then place it on the top of the wire. Hold the line in your left hand and the rod in your right, and carefully search under large stones, in the cracks of camp-shedding, and other likely places for the eels. Presently you will feel a sharp snapping against the wire; slowly then withdraw it, leaving the bait with the eel; of course he has the needle as well, and after he has gorged it all you have to do is to pull steadily; the needle catches and gets crosswise in his throat, and out comes the eel on *terra firma*. Give ten minutes to gorge it. It is best to have a supply of needles ready, for the difficulty is to extract this curious fish-hook when it is once fixed without cutting off the fish's head. Of course "bobbing" is a daylight pastime, whilst sniggleing can only be done at night; the finer day for the former, and the stiller it is, the better for sport. The eel may be instantly killed by sepa-

rating the back-bone just behind the head at the back.

There is yet another night dodge, which I confess I have never seen practised myself, though I have heard all particulars from those who have got good sport with it. It is called "clodding" for eels. A piece of red worsted is made up loosely like a ball, with a small piece of lead inside. A dark, still night is chosen, and sometimes it is a stream, and sometimes still water which is the chosen *locale*. If it is a stream, the "clodder" sits himself down by the edge, and, with the "clod" attached to a stout stick or rod, prepares for action. About three yards above him stands another, who holds a dark lantern, at which he lights little screws of paraffined paper, and pitches them on the stream. As the paper floats down the clodder follows it with his clod, or red worsted ball, and the eel coming up to see, bites viciously at this, and is instantly drawn out and thrown behind him to his boy, who, with a dark lantern also, and using a rough cloth in his hands, picks up the eel and throws it into a box. As many as twenty of a night are often secured like this, I have been told. Many a time have I speared eels with a barbed spear (shaped like a garden fork, with serrated tines close together) in the night, using a light, for fish are very fond of coming up to a light. "Burning the water" is the term used by salmon-poachers.

One of the principal things to be seen to this month, then, is repairing the damages to the runs. The summer that has gone has been, as we predicted, a hot one, but the winter may be severe notwithstanding, and nothing is more ruinous to fowls, or tends more to lessen egg production, than cold, wet, sloppy runs. For these not only put the birds out of form, but they breed disease. Take time by the forelock, then, and be prepared. To those who go in for the building of new poultry-houses we say, have them thoroughly comfortable and dry, even if they cost a little more at first. Beware also of overcrowding; do not be in too much of a hurry to stock. A few fowls of really good strain and stock, whether intended for egg or for meat produce, will be better than a barnful of ordinary kinds. Prepare now for fowl-showing, but never think of entering a bird unless it be at least worthy of notice. Therefore make yourself well up in the points and properties you take up.

Look out for cases of illness, and take them in hand at once. Warmth and a more generous diet will often be more beneficial to a sick fowl than even medicine. The old henwife's plan of taking it into the kitchen, rolling it in flannel before the fire, and feeding it on nourishing tit-bits, has many merits.

Diarrhoea is one of the diseases of the season. Treatment: Find out the cause, and remove it; it generally arises from cold, damp, and from sour unwholesome food. Give bone dust and chalk mixed with the meals, or boiled rice, oatmeal, and chalk, or three drops of chlorodyne three times a day made into a bolus with arrowroot or flour and a drop or two of milk.

THE PIGEON LOFT.—If everything has been in full swing during the summer, you ought to have a few birds worth showing. Take care of them, feed well, keep the whole loft clean, and beware of wet and

draughts, especially if your birds are of the more delicate sorts. Some birds, such as pouters, require special training before they can stand any chance as show birds. They are penned, but not all day long. They are inclined to mope if kept constantly confined. The object is to get them to play up and look their boldest and prettiest. They should be quite familiar with you, and glad to see you without being too excited. The exact plan can hardly be described on paper, but will come to you naturally if you be really fond of the birds and take an interest in them. In preparing for shows, so far as the birds themselves are concerned, remember that while the judges expect to see them looking clean and healthy-like, that any tampering beforehand with plumage, or beak, or wattles, will be detected very soon at the show, and dealt with summarily. In fact, the bird will be disqualified, to the disgrace of his owner. There are special boxes and baskets made for the purpose of sending pigeons to shows in. If you be a novice, make a point of seeing some of the best of these, and get one or two made like them. Shows are advertised months beforehand in such papers as the "Exchange and Mart." If wishing to exhibit at them, all you have to do is to get the secretary's address and write for a schedule; you must then adhere most carefully to the rules in every single particular.

It is too soon to begin buying in birds for subsequent mating. Those who already have lofts must go on thinning, weeding out the worst birds for market or pot, and retaining only the requisite number of promising ones. Repairs must likewise be attended to against the coming bad weather. It is a good time now for such as wish to go in for the pigeon fancy to get up a loft. While keeping your loft perfectly clean, and using disinfectants judiciously, do not forget that you can taint the air even by these same disinfectants. In cleaning up beware of slop and damp.

THE AVIARY.—We hope that by means of the hints given by us from month to month last season, some of our boys will have succeeded in getting birds worthy of the show cages, and that they will take honours. Even a commended card is something to show that a boy has not been altogether idle. Get ready for shows then if you are one of the lucky boys; if not, wait and hope for better times another season. If your birds are not completely moulted, continue the cayenne feeding; after this it may be discontinued, though we question if this should be done quite all in a day without danger to the birds' constitution. We might go farther, and say it is a question whether cayenne feeding is natural at all, and not always injurious.

Keep your bird-cages very sweet and clean, and let there be abundance of fresh air in the rooms where the birds live, only take care in damp foggy days; open the windows then only in the middle of the day. Do not keep useless birds; and a canary that is not well up in points and properties is useless unless you desire a mere song-bird.

THE RABBITRY.—This is the month for making repairs in the places that contain live stock of all kinds, whether they live in house or hutch. Rabbits, we consider, are as a rule very much neglected in the matter of housing and internal comforts generally. Boys especially expect them to live continually in confinement, their prisons too small almost to turn in, their bedding a vile mass of corruption, and even food itself not given with regularity. If we remember what rabbits are in the wild state, free to rove over fields and through woods, in shade or in sunshine, and sleep at night in roomy, dry, but well-ventilated burrows, can we wonder much if, when all these conditions are quite reversed, they should fail to thrive, and suffer from skin and bowel complaints, and ailments of many other kinds fatal to parents; or, if they live, destructive to the constitutions of the offspring? We say to every boy who means to take rabbits as his hobby, consider what we have just said; let him arrange matters so that his little favourites may have fresh air, light and shade, as they feel inclined, exercise, and good food, and bedding sufficient to keep them warm and dry.

Make a collection of clean bedding on dry days now; it helps to keep down expense in winter, and makes the bunnies pay their way.

THE KENNEL.—"I'm going to keep a dog," we heard a boy say, "and any little box will do to make him a kennel." This was a great mistake. But we believe a large cask can be got cheap at the grocer's. No matter how big it is, so long as there is room to put it in. Get the end closed up, and make the hole at the side. Or, better still, have the end in the form of a door to open and close, but to fit so well that in bad weather it shall be free from draught. This will make a good kennel. But it must be regularly scrubbed and well-bedded. Have the chain as long as possible, and with two swivels on it. But do not get a dog of any kind unless you can afford the time to take him out twice a day for a good romp. He will benefit greatly by such exercise, and so will you.

THE KITCHEN GARDEN.—Get your root crops out of the ground and stored, then planting greens of different sorts for winter use, and keeping down weeds, will occupy the time of the amateur gardener well this month. But there will also be bits of ground to be rough dug, so that the frost may kill weed seeds.

THE FLOWER GARDEN.—Sturdy your ground, and determine all alterations of beds and borders, and sow flower seeds where you want them. The only advantage of planting out seedlings in early spring is that you may previously have had the ground occupied. Where space is no object sow the hardier seeds at once. They will stand the winter well. It is time now to get in your spring flowers.

THE WINDOW GARDEN.—Autumn flowers and evergreens, with a few hardy ferns, etc., must now be depended on to keep up a gay appearance.

THE POULTRY RUN.—There are many advantages accruing to boys and others who make the keeping and breeding of the smaller kind of live stock a hobby, and some of these are pretty solid ones too. Not the least of them we think is the learning of business habits, that are sure to come in handy in after life. For without regularity, tact, and careful thought being brought to bear upon the study—and study it must be—not much good can be done. So the mind is instructed and trained, while at the same time it is kept amused. A little money is required to start the young farmers at first; this will readily be advanced, we should imagine, by fathers or relatives. It cannot be otherwise than a pleasure to them to be told of ways by which "our boys" can earn their own pocket-money.

The breeding of all animals is pleasurable employment, and hardly any home is too small to keep one or other of the kinds in. For where fowls or rabbits may not have room, pigeons might thrive, but failing these there is the lesser fry—canaries—and all may be made a source of profit to a greater or less extent. Every month brings its duties; it will be our duty, therefore, as heretofore, to supply our readers in brief but handy paragraphs, with just that information which will tend to keep them up to the mark in the knowledge that is desirable.

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

So great has been the interest shown by our readers in these competitions, that we intend not only to continue, but to increase their scope and attractions.

We start our competitions for the present volume with the following subjects, and shall announce many others, specially chosen to suit all classes of readers, as the volume progresses. We should like to repeat here what we have more than once stated, that where there may seem to be any doubt as to our exact meaning in the announcement of subjects, competitors will be quite safe in following their own judgment in the matter. Our one object in these competitions being to help our readers, they may be quite sure we should not allow any deserving worker to suffer because of any accidental misunderstanding. The general rules must, however, be strictly adhered to.

I.—Writing Competition.

As really good legible handwriting is becoming increasingly appreciated, especially in commercial life, our first competition shall test the skill of our readers in this direction. We offer, therefore, *Three Prizes, of One Guinea each*, for the best copy, in plain handwriting, of the 1st Psalm, from the Authorised Version. Competitors will be divided into three classes—the Junior Division, embracing all ages up to 14; the Middle Division, all ages from 14 to 18; and the Senior, all ages from 18 to 24. *The last date for sending in is December 31st, 1844.*

II.—Illuminating Competition.

We offer *Three Prizes, of Two Guineas, One Guinea and a Half, and One Guinea respectively*, for the best Illumination (in oils or water-colours) of a Bible promise, which may be selected, at the option of the competitors, from either the Old or the New Testament. Competitors will be divided into three classes, according to age, and one Prize will be awarded in each class. First class, from 18 to 24; second class, from 14 to 18; third class, all ages up to 14. The highest Prize will go to the class showing the greatest merit. Competitors are not prohibited from using purchased designs, but the colouring must be wholly their own, and, other things being equal, the preference will be given to original work throughout. The size, material, etc., are left to the choice of competitors.

The last date for sending in is January 31st, 1855.

III.—Fretwork and Carving Competition.

So great was the interest shown in our previous Fretwork Competition, that we have determined to give further Prizes in connection with the subject. We now, therefore, offer *Three Prizes, of Two Guineas, One Guinea and a Half, and One Guinea respectively*, for the best blotting-case or blotting-pad cover. The size, wood, tools, etc., are left entirely to competitors' own choice, but the natural difficulties presented by some woods over others will of course be taken into due consideration by the adjudicators. The cover may be entirely fretwork, or carving—whether sunk or in relief—may be combined with it. The divisions as to age will be precisely the same as in the above Illuminating Competition; but *the last day for sending in will be February 29th.*

IV.—Music Competition.

Our last Music Competition was very successful, and we see no reason why this one should not be even more so. We offer, then, *Prizes of Two Guineas and One Guinea respectively*, for the best musical setting, with organ or pianoforte accompaniment, of any of the verses appearing in our last volume (Vol. VI.). There will be two classes—Junior, all ages up to 18; Senior, from 18 to 24. *The last day for sending in is March 31st.*

It will thus be seen that we have selected subjects likely to afford all classes a fair chance—boys at home, and at schools; boys with leisure and opportunities, and boys who are already engaged in the sterner duties of life; boys to whom a preliminary outlay may be no great object, and boys who rarely have a shilling to spare. All the subjects are equally open to every reader within the ages specified: so that any one boy may, if so disposed, try in all the competitions. We must invite, however, the most careful attention to the following

RULES AND CONDITIONS.

1. No article of any kind sent in will be returned, whether accompanied by stamps or not—a rule rendered necessary by the immense number of readers who join in these competitions. To return in all cases would be next to impossible, and it is not fair to make exceptions. The best of the articles will, as hitherto, be sent to hospitals, training-ships, ragged-schools, and other useful public institutions, as a gift from the readers of the *BOY'S OWN PAPER*. The result of each competition will be duly published in our columns, and no questions on the subject can be answered through the post.

2. The prize-winners may either receive the money itself, or the money value in such approved articles or books as they may select. In all cases money will be sent, unless we are otherwise instructed.

3. In addition to the prizes, handsome "Certificates of Merit," suitable for framing, signed by the Editor, will be awarded to all the more meritorious competitors who may fail to secure prizes.

4. The work must in every case be the competitor's own—that is, must be the product of his own hands and brain; though of course any aids received merely in the way of suggestion, whether from books or friends, are admissible.

5. All MSS. must have at the top of first page the full name, address, and age of sender, clearly and legibly written, thus:—

Name.....

Address

Age.....

In the case of the Illuminations, Carvings, etc., these same particulars should be written on a separate piece of paper, which should also bear the certificate (see Rule 7), and must be stitched (not pinned) on the front top left-hand corner, or gummed to the back.

6. All the subjects are equally open to every competitor, but where any competitor may try for prizes in two or more of the subjects, he should be careful to see that in every case the particulars are repeated according to these instructions with each separate article.

7. All contributions should be certified by parent, clergyman, minister, teacher, employer, or other responsible person, as genuine unaided work. By this certificate we simply mean a letter, or even an endorsement under the competitor's name, thus:—"I hereby certify that the accompanying article is the unaided work of —." Signed —.

8. All letters or packets must be plainly marked outside "Prize Competition, Class —," and must be addressed to "The Editor, *BOY'S OWN PAPER*, 56, Paternoster Row, London," carriage being, of course, prepaid.

Correspondence.

TELEGRAPHS.—1. The oval or diamond-shaped boards hanging on the signal-boxes are used to show that the telegraph is in working order. 2. The capital R is the initial of recipe—take.

ANIMAL LOVER.

—Clip off the matting, and keep the rabbit well and cleanly bedded. What you describe seems to be the Siberian rabbit, which has the dark points of the Himalayan and the long coat of the Angora.

TOBY.—1. Take the licence out in January early. Do not feed on the table scraps. 2. Steep the horns in a solution of carbolic acid and

water, and next anoint inside with arsenical paste. Fill up with plaster-of-Paris if weight is no objection.

S. E. has a hedgehog, and does not know how to feed or tend it. He ought, for hoggie's sake, to have found out this before getting such a pet. The staple diet in captivity is stale bread and plenty of nice fresh milk. A good large plateful should be given every evening at dusk. Also garden worms, snails, etc. Put an armful of nice dry hay in a corner; it will roll itself up and sleep in this. In very cold weather the hedgehog sleeps day and night. In summer give it its liberty, like a cat.

G. E. M.—You say you have read our Poultry article with great interest, but yet you ask us how to feed and treat a fowl! We were most explicit on these points. Kindly refer back.

Loco.—In 1882 the number of passengers killed from causes beyond their own control from accidents to trains was in the proportion of about one to forty millions, so that there is nothing wonderful in the low rate of railway accident insurance premiums.

E. C. (Kingston).—Touch the swelling on the blackbird's back about every second day with tincture of iodine. You ought to have known how to feed and treat it before getting it. Perhaps a little lead ointment will do as well. Feed on ground oats made into a paste with fresh milk. Give snails, grubs, worms, shredded meat, and fruit, especially grocers' currants.

A LOVER AND KEEPER OF DUCKS.—You will find an article on ducks in No. 186, in the September part for 1882.

W. BAZLEY.—Dumb-bells should never be heavy; about two pounds per bell is quite sufficient for any age or constitution.

EMIGRANT.—1. You should learn from a teacher. 2. With gloves is the best way. 3. You will find how to waterproof lines and casts in Mr. Keene's Fishing Tackle directory. 4. A professional rabbit-trapper with a knowledge of farming would be almost sure of employment in the Australian colonies. 5. Any book will be sent you by a London publisher if you will prepay its cost and the postage.

D. M. S.—To make the ornaments confectioners put on cakes, soak gum-tragacanth in water until soft, and then mix it with powdered starch and refined sugar until it is thick enough. Mould the figure into shape, colour it, and varnish with white varnish. Never eat ornaments off confectionery; even the icing is not always wholesome.

F. ADDISON.—It need not necessarily be in Africa. Orange, the original one, in the Vaucluse, France, has 10,301 people; the American Orange, in New York State, is larger—it has 13,207. There is an Orange in Maryland, with 2,124 inhabitants; and another, a very thriving one, in New South Wales, with 2,701. There are seven Orange counties in the United States.

PEN.—1. See "Fishing Tackle, and how to make it," in the third volume. 2. To clean bottles throw in a few snippings of iron wire and shake them round with the warm soap lye or whatever you use. Soap lye is made by boiling together a handful of quicklime and a handful of common washing soda.

S. D.—Indelible paper is a queer expression, but we understand it to mean a paper so prepared that anything written on it can never be removed. One variety of such paper is made by dissolving some best Scotch glue with five per cent. its quantity of potassium cyanate and antimony sulphide, and passing the paper through it; another solution, a dilute one, of magnesium or copper sulphate is prepared, and in this the sheet is immersed. This paper cannot be tampered with without detection, for acids would colour the writing, and alkalis colour the surface, and erasing would show the white ground beneath the chemical coating.

C. L.—Counting from Ceres to Barbara, there are two hundred and thirty-four asteroids now known. You will find their names in Whitaker's Almanack. If you want to select a boat's name you could not do better than refer to a list of the asteroids.

SKIN-DRESSING.—From C. E. we have received two pieces of hareskin that would be a credit to any skindresser. The process he adopts is simply to make a thin paste by mixing a table-spoonful of plaster-of-Paris and water, and then thinly painting the skin over with it.

J. A.—In cases of failing eyesight consult an oculist at once. Delay is always dangerous in such matters.

K. NEEDWOOD.—There are about eighty miles of underground railway in Great Britain. There are tunnels beneath the Wear and Tyne, and at Whitehaven and Botallack the mines run under the sea. At Whitehaven the tunnel extends for a mile beneath the salt water.

VIXEN.—You can teach yourself water-colour painting up to a certain point, but it is almost imperative that you should have a few finishing lessons if you wish to excel.

JACK.—1. The spanker or driver. 2. A ship's courses are the sails that hang from the lowest yards. The foresail is the forecourse, the mainsail is the maincourse, and the cro-jack is the mizencourse. 3. "On a taut bowline" is as close to the wind as you can sail the ship; "on an easy bowline" is when she is a little freer, say almost on a reach. The bowlines are used to flatten and steady the weather-edge of the sails when the ship is beating to windward.

MEDICUS.—1. You cannot get stains out of ivory without dulling the polish. Sulphurous acid, chloride of lime, or chlorine will bleach it. 2. Not that we know of, but there is no reason why it should not be, if the weights were only lifted long enough.

J. HENRY.—1. The young swans on the Thames are hatched about May. You will often see the hen swan sailing about with the cygnets on her back while she is giving them their earliest swimming lessons. The brood is about half a dozen. The swan companies are the Dyers and Vintners, both of whose halls are on the bank of the river. The Royal birds have two diamonds, the Dyers' birds have one nick on the right side, the Vintners' birds have two nicks on each side—hence "the swan with two nicks," or "the swan with two necks." The number of birds allowed on

the Thames is 610, of which the Crown has 500, the Dyers 65, and the Vintners 45. 2. Quite right then, but not now. The Thames Conservancy handed the Northfleet Light over to Trinity House in 1870.

T. WARNER.—Because it was in the summer time. In the winter the plumage of the ptarmigan is white; in the summer it is dark grey, with the breast and feather-tips rather light-coloured.

M. C. Y.—1. It is two hundred and twelve miles from Beachy Head to the Lizard, thirty from Beachy Head to Dungeness, thirteen from Dungeness to Folkestone. The Shambles light is off Portland, the Caskets off the Channel Islands, the Star is off Dartmouth, the Eddystone off Plymouth, the Longships off the Land's End. 2. Boys in the Navy can be bought off for £8 in their first year, but afterwards the cost of discharge is £12. If you anticipate being bought off don't go. The country will feel no richer for the gain of the £8, or poorer for your loss, and your parents could make better use of the money elsewhere. 3. Ripples are waves caused by a slight breeze, sometimes called a catspaw. White horses are small waves broken into white foam. Breakers and rollers are large broken waves in shallow water, or on reefs, rocks, and banks. Swell is the heaving sea. Ground-swell is the long heaving motion connected with a distant storm. Chopping or cross seas are short irregular waves caused by changing winds. Spindrift is the spray blown from the surface of the water by a heavy gale.

D. S.—1. Benzine dissolves all the oils, resins, gum-resins, varnishes, and fats. 2. The cheapest refrigerator is a hole in the ground. Wrap the ice up carefully in an old piece of flannel, and bury it as deep as you can. It will sometimes last underground for weeks in the hottest weather.

S. INDEN.—Blue and yellow make green, blue and red make purple, red and yellow make orange, and so on. You should experiment with the combinations before you begin to paint. We leave you to discover for yourself "the most polite way to offer a young lady your arm, and also how to gain consent to carry her umbrella." As a rule, gentlemen who borrow umbrellas are regarded with suspicion by the ladies.

SENOJ.—See our articles on netting in the second volume. You cast on a row of stitches the height you want and work longways from them, keeping the number the same throughout.

SION JAMES.—1. The best way to kill the cat is to take it to the nearest druggist and get him to give it a dose of prussic acid. 2. Perhaps Rickman or Freeman, but it depends on what architectural period you wish to go in for.

SAILOR.—1. Your only way to get poisonous drugs for experimental purposes is to apply to your doctor. 2. The prices of the Boyton suits are not quoted. A ten. You can hardly call floating about in an india-rubber suit swimming.

CERES.—The highest jump is P. Davin's, 6ft. 2½in., at Carrick-on-Suir, on July 5, 1880; the longest jump with a run is Lane's, 23ft. 1½in., in 1874.

WOODEN LEG.—The boot does not polish because it is too greasy. Give it a coat of heel-ball, or wet it thoroughly when on your foot, and dose it with castor-oil, tallow, or dubbin. As the wet dries out the oil soaks in.

A. M.—You can always get the indexes sent to your address by forwarding us three-halfpence.

HUSSAR and SABRE.—The answer to all such questions is "Go and see." A stroll over Westminster Bridge would soon reveal to you a real, live recruiting-sergeant, and an application to the nearest post-office will provide you with full directions as to what to do. If you are ashamed of going for a soldier, don't go.

No. 300.—Vol. VII.

SATURDAY, OCTOBER 11, 1884.

Price One Penny.

SCHOOL AND THE WORLD: A STORY OF SCHOOL AND CITY LIFE.

By PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER II.

"BREAK off!" It came at last. What a change!
Strict silence became loudest uproar, mili-

tary discipline was
turned into the wildest
confusion.

"Now, you young fat-chaps, I'll teach you to push against me when we are dressing!" shouts little Dexter to a chum of his with whom he is generally at daggers drawn.

"I didn't!" retorts Featherstone; "and if you touch me I'll be the death of you!"

They clutch at each other wildly and roll over into the dust, where they might have had their fill of struggling without interruption if Dickson, a big upper-school boy, had not stumbled over them.

"You little louts!" he began, but they did not wait to hear the rest, they scudded away to the field, where cricket was already begun.

"They clutch at each other wildly."

"Bother the kids!" muttered Dickson, wiping off the dust from his trousers, "they're as bad as pups for getting in your way."

"Spoiled your new pants, Dicky?" inquired Lang, as he passed towards the field.

Dickson disdained to reply, though perhaps he would have done so if he had had a good retort ready.

The old sergeant disappeared through the gates; it would be three days before his burly form would again be seen. Drilling in August is—well, there is no word strong enough to meet the case without using one which might look like an exaggeration.

Dickson continued brushing his clothes till he felt he was himself again, and then walked slowly to a distant tree, beneath which he found Melhuish reclining lazily, apparently busy with a book.

"Hullo, Melhuish! What are you reading? Got something worth lending a fellow?"

"Yes, not bad; one of Marryat's."

"Marryat's?" cried a hearty voice, and the round face of Soady beamed on the pair. "Which is it?"

Melhuish handed him the volume, as the easiest way of answering.

"Why, it's the second volume!" exclaimed Soady; "and you told me yesterday you hadn't read the first!"

"Eh?—what?" asked Melhuish, quickly. "Why, so it is! I hadn't noticed it. I only just took it out of my pocket as you fellows came up."

"Why, you were reading it hard, I thought," persisted Soady.

"Oh, shut up!" exclaimed Melhuish, angrily.

"You needn't get waxy over it!" went on Soady, with good-natured obstinacy.

"Can't you leave a fellow alone?" asked Melhuish. "You are always poking your nose where you aren't wanted."

"I don't want to poke it where such a sweet-tempered chap as you are is trying to snap it off," retorted Soady, not very powerfully. "Good-bye, and I hope your temper will improve."

With which parting shot (a very good one in the shooter's opinion) Soady marched off to find a more congenial companion.

"What a sap he is!" remarked Dickson.

"An awful fool!" assented Melhuish. "I wish he wouldn't be always bothering round me."

"No, I don't know what we are coming to nowadays with fellows like him in the first form. Why, I remember when he came, and a precious little ass he was. I used to lick him once a week regularly."

"You don't do it now," said Melhuish, with a touch of sarcasm. Soady had grown big and strong; it would have taken Dickson more than he could manage to stand up and face his former victim. Fortunately for him, Soady was of a forgiving disposition, and had contented himself with giving his former tyrant a good licking, once for all.

"Heard anything of Fanshawe lately?" asked Dickson, by way of changing the subject.

"Not much; I saw him a good deal last holidays. He is in London, going in for law."

"In London? Lucky beggar! I wish I were."

"So do I," assented Melhuish. "He seems to be having a high time of it."

When I get out of this hole I'm going up to London too, and 'twon't be my fault if I don't enjoy myself."

"This is a hole, and no mistake," said Dickson. "If a fellow dresses decently all the cads of the place make such a row about it one would think they had never seen a new coat in their lives. 'Tisn't like a regular public school; this half-and-half sort of place is worse than an ordinary private one. By-the-bye, I thought Fanshawe was going to Oxford?"

"So he was, but his father said he couldn't afford it. He's been losing money lately, I heard."

"Well, I don't know that 'tisn't better being in London than at college, where you've got those old proctors always down on you, and have to go to chapel, and all that sort of thing. That wouldn't suit Fanshawe much, would it?"

"Not by long chalks."

"I say," continued Dickson, "he went it down here his last half, didn't he? I heard that it was a narrow squeak that he wasn't expelled, only the Doctor didn't like to send away a big fellow who was going to leave at the end of the term. Did you hear anything about it?"

"Not much," said Melhuish.

"What did you hear?"

"Oh, never mind!"

"You might tell a fellow," persisted Dickson.

"Well, I heard he got hard up, and wrote home for a subscription to a testimonial to the Doctor that he said the school was getting up, and somehow it got round to the Doctor's ears. Old Fanshawe wrote to congratulate him, or something, and then there was a bust up sort of shine, you can guess. If it hadn't been for old Fanshawe promising to take him away at the end of the term, I don't know what wouldn't have happened."

"He was no end of a fellow!" said Dickson, admiringly; "that was a clever trick; now I should never have thought of it."

"Oh, he's clever enough for anything," said Melhuish. "I wish I had half his brains; he's passed the matriculation in honours since he left."

"Are you going up?"

Before Melhuish could answer, a small boy came up to them.

"Please, Melhuish and Dickson, you're wanted in the small class-room."

"Who wants us?"

"The Doctor wants all the first form."

"What's that for?" asked Dickson, wonderingly.

Melhuish swallowed a lump in his throat before he answered.

"I'm sure I don't know," he said.

CHAPTER III.

THERE is a black sheep in every flock; so in every school there is one boy pre-eminent in badness. Fortunately for St. Mary's College, the worst specimen it had known for some years had now left. Fanshawe was a boy in whom bad instincts had been nourished by his training, and who, from constant lack of moral fibre, had gradually deteriorated till by the time he was seventeen and left school for the world he was about as likely a specimen of a young scoundrel as could well be found.

But, although St. Mary's was now free

from his presence, his influence was not yet dead. The seeds of evil which he had sown in not a few hearts were gradually bearing fruit. Amongst those who suffered most from him were Melhuish and Lang.

Melhuish offered a good field for evil influences, for he was inclined towards evil, and even without Fanshawe's direction would probably have turned out anything but well. Lang was of a better disposition; a good-natured boy, who under the leadership of a stronger mind than his own might have turned to either right or wrong. Unfortunately for him, the stronger mind with which circumstances brought him into contact was that of his tempter Fanshawe.

Hitherto, however, both boys had managed to sustain their characters fairly well, at least in the eyes of the authorities. Melhuish was known as a rather dangerous companion, but Lang was still favourably looked on, and with more reason. Since Fanshawe left he had to a certain degree "rehabilitated" himself, and, except that he was more prone to mischief than most boys of his age and standing, was regarded as an average specimen of the first form.

The two boys were to some extent chums still in virtue of their former intimacy with Fanshawe. But Lang was gradually drawing himself free from Melhuish, though he was beginning to recognise how hard it is to keep straight when an old companion in wrong-doing is constantly at hand.

Most of the boys with whom we have made acquaintance belonged to the first form now summoned by the Doctor. At St. Mary's the usual order of forms was not followed, but the first was the first, the second the second, and so on. Monitors were non-existent, but the first form were supposed to exercise an informal authority over the lower school, meaning the last three forms.

As the boys entered the house there was some discussion as to the meaning of the summons.

"I think it's a half-holiday," said Soady, decisively.

"Why don't you think it's a whole one?" suggested Dickson. "Would be just as easy for you and twice as pleasant."

"What do you think, old boy?" asked Lang of Ferguson.

"Can't think, it's too hot. Shall know in two minutes."

The Doctor was waiting for them in the small class-room.

"I'm sorry to call you all in such a beautiful afternoon," he began, "but it's about a matter which should be known at once. Simpson has reported to Mr. Smith, who of course informed me, that some money which he kept in his box in the Rummage-room has mysteriously disappeared. Now I am quite ready to believe it possible that Simpson has been spending more than he remembers, and that he is making a mistake, but he is so positive about it that I am obliged to mention it. He says the money was there when he went into school to-day, and when drill was over it was gone. Garland, you had to see that every one was at drill to-day: were there any absent?"

"No, sir," replied Garland, a tall, rather thin boy with deeply-cut features: a pleasant face, but not one that could be called handsome. He looked like a

boy that could be trusted implicitly, and so he was.

"Then you see," continued the Doctor, with a smile, "that one of you is implicated, it seems. No one could have gone to the Rummage-room during school or drill, and you were the only boys who were not drilling. By the way, none of you keep any boxes there, do you?"

There was a general murmur of "No, sir."

"I thought not. None of you went there during drill, I suppose, by any chance?"

A pause, but there was no reply. Soady's eyes were fixed on Lang, who was unconscious of them. He was undergoing a mental struggle. Before he had come to a decision the Doctor went on,

"You may as well keep your eyes open, and I think I shall advise Simpson and others of the lower school that they had better let me take care of any money they have beyond half-a-crown. You may let this matter be kept quiet, I have told Simpson not to mention it. But if anything comes to your ears you must let me know at once. No absurd feeling about honour must be allowed to stand in the way of the character of the school, unless you are prepared to admit that on the principle of 'Honour among thieves'

you should be silent when you ought to speak out."

Various were the comments amongst the boys when the open air was reached again.

"What a storm in a teacup!" said Ferguson. "Doesn't the Doctor like to hear himself spout!"

"Little beast Simpson is," remarked Dickson, "to go and sneak about losing eighteenpence. I expect it's all nonsense, it's dropped out of his pocket."

"Yes, that's it," said Melhuish, the first time he had spoken since the summons came. He stopped suddenly now as if he had said too much.

"I hope it is," added Garland. "One hears of fellows stealing at schools, but we've never had a theft here yet, and I hope we shan't."

Lang did not join in the talk; he soon left the others and went to a quiet corner where he could lie undisturbed, a book in his hand to account for his wish to be alone.

He had undergone a temptation and had failed to conquer it. He felt he had dropped back an incalculable distance in his moral career. He had a mingled feeling of guilt and innocence. Of course he never took the money; he shrank from the thought; but then he had

visited the Rummage-room during drill, the time when the money was stolen. When the Doctor asked if any of them had been there, the chief thought in his mind was that if it were known he had been there he would be thought the thief!

"I'm glad I didn't say anything," he said to himself. "Nobody knows I went in there, and if I had said I had it would have been impossible to prove that I didn't go to Simpson's box. Now no harm is done; I didn't take the money, so I'm not bound to get myself into a hole by bringing suspicion on myself."

However, he was not able to argue himself into satisfaction with himself, though he tried hard.

"Oh, confound it all!" he exclaimed at last; "I shouldn't have thought two straws about it last half, why on earth should I make such a fuss about it now? There isn't a fellow in the place who wouldn't have done just as I did, except perhaps Garland."

So he settled down for a quiet read till tea-time, which was rapidly approaching, feeling that his day had not been quite so satisfactory as he had anticipated.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

THE WRECK OF THE CAWARRA.

It should be said at once that the story of the wreck of the Cawarra is specially interesting as being a sequel to that of the Dunbar related in our part for last June. The Dunbar, it will be remembered went to pieces in Sydney Gap, the Cawarra was wrecked on Newcastle

oyster-bed; and, by a singular fate, Johnson, the sole survivor of the famous clipper, proved to be the rescuer of the sole survivor of the ill-fated steamer.

The Cawarra belonged to the Australian Steam Navigation Company, and left Sydney on Wednesday, 11th of July, 1866, for Brisbane and Rockhampton. Her passengers and crew numbered sixty all told, and she was somewhat heavily laden, her deck cargo being considerable.

During the night there came on one of the severest gales ever known on the eastern coast of Australia. The storm grew so during the morning that the fury of the fearful sea has

never yet been exceeded even in the Pacific. The waves came roaring into Broken Bay and Port Hunter like huge hills of foam, and lashed the shore with such force that the beach seemed to thrill beneath their blows.

About one o'clock in the afternoon the look-out at Newcastle Lighthouse signalled a steamer making for the port from the northward. The flag was run up warning her to stand off and keep out to sea, as it was too rough for any vessel to attempt to enter the harbour. Apparently the vessel did not see the flag, for on she came, and in about an hour had steamed close in. At last her crew became aware of the difficulty of their task, and attempted to return to the open. As the vessel wore to gain an offing she was recognised as the Cawarra.

Her effort was made too late. She could gain no headway against the sea, and slowly and surely was swept on to the bar. The engines were going full speed, but as the surge welled over her bulwarks her bow was seen to sink deeper and deeper, and cripple her power of steerage. For a few minutes the doomed ship drifted helplessly, and at three o'clock she struck.

The people were seen to be clustering on her poop and in her rigging. But the suspense was short. So violent were the waves that beat on her that in a quarter of an hour funnel and mainmast had gone over the side. Five minutes afterwards the foremast went, and before a quarter to four the Cawarra had vanished, and all that was left of her were the wreckage and the bodies that every now and then rolled over on the crests of the billows.

Owing to the violence of the gale, the pilots and most of the regular lifeboatmen were aboard the vessels in the harbour, fully employed in keeping them out of danger, and the lifeboat was not launched until the steamer had gone aground. When the boat felt the sea she was soon rendered useless, for a heavy wave came aboard and eight out of her fifteen oars were snapped off short.

Other boats, however, put out to the rescue, the first and foremost being the lighthouse

dingy. Johnson, the Dunbar hero, was then employed in the lighthouse, and he and Hannell, the keeper's son, rowed off in the tiny craft to lend a helping hand. The terrific sea prevented the boats advancing very far, but the little dingy got out the farthest, and was soon among the wreckage.

At half-past five a man was being swept past her, when Johnson, leaning over the side, seized him and lifted him on board. The rescue was only just in time. The dingy returned; the apparently drowned man, then insensible, was put to bed, and in a few hours recovered. He was one of the crew—a Bristol man, F. V. Hedges, who had come to Sydney the year the Dunbar went down. He was the sole survivor of the Cawarra.

It seems that Captain Chatfield, finding the gale increasing, resolved to seek shelter in Port Stephens or Newcastle, and as he came westward chose the latter. The fore-staysail was hoisted, and blown to ribbons; the fore-trysail alone would stand. As the Cawarra neared Nobby's the danger of the entrance was perceived; and although a daringly-handled little schooner came flying in at the time—snapping her mainboom as she did so, and to it probably owing her safety—the steamer was brought head to wind.

The jib was set, but had hardly got home before it was "sent into slithereens," and the vessel broached to. The waves dashed on board and the water poured down the forehold, but as the fires were not put out, and the engines could be kept going, no signal of distress was hoisted. The crew retained their coolness to the last, and the captain gave no sign that he thought his ship in danger.

The Cawarra drifted out of the breakers into smooth water, and the deck cargo was thrown overboard. As she headed outwards she shipped another sea, and this quenched the fires. As soon as this happened some men got into the lifeboat and were immediately ordered out by the captain to make room for the women. Shortly afterwards orders were given to clear her away, but the

tackle jammed, and Hedges alone of those who remained in the boat scrambled on board again.

The ship was now aground. Hedges and others took to the rigging, the boats being all rendered useless. The masts were shaken out, and then she broke up. Hedges grasped a piece of the wreck, and changing from piece to piece until he found a plank big enough to support him in safety, was only washed off it to be picked up by Johnson.

From the shore the progress of the little dingy, as she rose and fell on the boiling sea, had been keenly watched. The news that a steamer was on the bar had brought the

raised, "She has gone!" And then, when she rose again to view, heaving up among the spray on the crest of some curving billow, the shouts that greeted her were mixed with the warning growls of the older hands, "She'll go next time, whether or no!" The crew, however, would not return empty-handed, and the perilous course was continued until the man was found.

The Cawarra broke up entirely, and the wind setting dead on the shore, nearly all that came from her was swept into the bay. The shipping in the port were dragging their anchors, and to the danger of grounding or fouling there was now added the by no

upon her before the masts fell, the hull canted over—and she was gone!

The day was spent in the mournful task of seeking for the bodies and bearing them away for identification. One of the first found was that of the captain, to be followed soon afterwards by that of the second engineer, who had been standing by the side of Hedges in the main rigging when the sea rushed over them.

Of the regular crew of the Cawarra one besides Hedges did not go down with her. This was the steward, Newlands, who, having injured his foot, was left behind at Sydney, a fact worth recording from the singular coin-

"She has gone!"

people down in crowds to the beach; and when the lifeboat returned disabled the excitement rose to fever pitch. All hope of saving the figures huddling on the ship seemed cut off. The "ancient mariners of the port" shook their heads, and at the same time chuckled with admiration as the tiny boat went out beyond the red buoy and advanced towards the breakers.

For the sea was dotted with the wreckage, and the frail timbers of the boat might be crushed in at any moment. Each time she disappeared in the wave-hollows among the floating fragments of the ship, the cry was

means inconsiderable chance of being damaged by the floating timbers and cases.

All that night the storm continued. Just before darkness set in a few bodies had drifted into fairly smooth water and been picked up; but it was not until the return of the tide that they were found in any numbers. Many were the watchers during the darkness, but little came to their hands. The sea still raged furiously, and in the first dim light of the dawn it was found that a small coaster had also been blown on to the bar and was just in her last throes. The glasses had hardly been brought to bear

cidence connected with it that the same man had been steward of the Star of Australia, and, injuring his foot, had been left behind on the last trip of that ill-fated vessel when she went to pieces, with all lives lost but two.

Slowly the gale abated. The damage done all down the coast was very great, and of the many small craft afloat when it broke out but few were ever heard of again. The majestic strength of wind and wave has rarely been more appallingly shown, and the colonists of the eastern coast still refer with awe to the great storm of 1866, in which the Cawarra was overpowered by the sea.

ONE OF MOTHER CAREY'S CHICKENS.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "A Dunce's Disasters," "The White Rat," etc.

CHAPTER II.

THE Dumpling was no more affected by his proximity to that game of football than is Nelson's statue by its proximity to those majestic lions in Trafalgar Square.

The fat boy strolled on with his hands in his pockets, whistling "Grandfather's Clock," and banging at everything he passed with an old cricket stump. He left his marks like the North American Indian threading a primeval forest. You could trace his progress everywhere. If Dr. Porchester had the railings painted in the holidays, the Dumpling's stump would register its trade-mark on them before he had been back half a day. Things sacred were no more safe against his vandalism than things profane. The spear-headed railings round the chapel were decapitated here and there by his destroying hand.

I think there must have been sad laxity of parental discipline at home. When his mother first brought him to school she had in a measure prepared Dr. Porchester for the worst. She had said, "I am afraid my boy is not very fond of his books; but he has a decided turn for mechanical pursuits. He is very clever at taking locks to pieces, and cutting things out with his pocket-knife. I hope he will have an opportunity of keeping up these tastes." The Doctor, with a twinkle of grim sarcasm, had replied, "Madam, I quite understand you, and I have no doubt your son will find the opportunity. But at Highfield we call these tastes *mischievous*, not *mechanical*, and do not as a rule encourage them."

The Dumpling sauntered on till he reached the confines of the cricket-field. He banged his stump not once nor twice upon the top wire of the fence, and watched the reverberating thrill pass down to the gate a hundred yards off. He then essayed to surmount the fence, putting one foot on the lowest wire, which bent to the ground, the other foot on the next wire, which gave in proportion. Then by a mighty effort he hoisted a leg over the top wire.

To get the other leg over required him for a moment to poise his unwieldy frame on a wabbling wire about one half-inch in diameter. This Blondin feat was beyond his powers. He lost his balance hopelessly and fell with irremediable ruin, like a sack of Portland cement, on the same side of the fence from which he started.

Rendered furious by this failure, he got up and belaboured the wires with his club. A second attempt was then made on different principles. He stooped to conquer. Putting his head and arms and shoulders between the second and third wires, he tried to wriggle the hinder portion of his body through. But this also was a hopeless business. The upper wire was elevated to its full extent, the lower one depressed abnormally; but no amount of kicking and jerking would enable the broadest and most circumferential portion of his person to get through.

Once upon a time, in Oxford days, I heard a mouse in my cupboard purloining biscuits. I knew of the hole by which the thief gained access, and opened the door to expel him. Like his prototype in the fable, my intruder had eaten himself to repition, and, foolish Trogly-dyte! he tried to escape by that same hole. He got half through, and remained helplessly stuck; and his ineffectual efforts for liberty were highly ludicrous.

Even so was it with the Dumpling, who only after grievous labour succeeded in extricating himself on the wrong side of the fence; baffled a second time, and exasperated into bellowing. He got up, and, like Achilles, shuffled off in mighty wrath to the gate; by which only available entrance he at last achieved his purpose.

There stood an ancient willow-tree in a remote corner of the field. Its trunk was hollowed out by time and decay into a cavernous recess, whereof the sides and ceiling were metamorphosed into touch-wood. Oftentimes, when the sun was shining brightly, would the Dumpling, like Prometheus, draw down fire from heaven with a burning-glass, and set this tree smoking and smouldering. He now bent his steps towards that goal, with what intent I know not.

He arrived on the sound side, and by force of habit began to worry the willow with some vigorous blows of the stump. The immediate result was a screaming and a clucking, and the precipitate flight of a Cochin China hen, the same bird which greeted us at the outset of this story.

The Dumpling jumped, and was on the point of hurling his club at the terrified bird. But he did not do that. He went round the tree and peered into the cavern, and there on a heap of touch-wood that had been scraped into the form of a rude nest he espied an egg reposing.

"Hullo," quoth he; "fresh eggs! Hi cockolorum!" by which cabalistic ejaculations he signified his appreciation of the discovery.

He knelt down and took up the egg, and whistled as he turned it round. It suggested a train of thought. The hen, meanwhile, recovered her scattered wits and came as near as she might venture to see what was going on, with pleadings of anxious expostulation that her property might not be pilfered or destroyed.

The Dumpling replaced the egg, and feeling in his pockets, drew forth some grains of Indian corn. With a "coopy, coopy, coop," to attract attention, he threw a few grains to the hen, which were eagerly devoured. By the aid of more corn he decoyed the bird back to the tree, and when once again she was installed in the cavern, he threw her a few more grains as a parting present, and withdrew, pondering many things in his heart, and soliloquising thus:

"Fresh eggs! I'd be able to get the other things, and just show that young ass Buffles that I can make a trifle."

The next day, at the same time, the Dumpling repaired to the willow-tree; and, after expelling the hen, found, to his delight, two eggs. Of these he selected one, and, depositing some corn by way of payment, he went off rejoicing. On three following days he repeated his tactics, only that on the last occasion he abstracted both eggs, thinking that five would be ample for the dish which was to confute the sceptic Buffles.

No wonder Mother Carey had been outwitted!

I said at the commencement of this tale that the Cochin China hen had been led into deceit by the Dumpling, and there were just grounds for the statement; for we have no reason to suppose that the bird was wilfully disposed to fraud; and, assuredly, had it not been for the fat boy's seductive allurements, she would never have returned to her cavern in the willow after the alarm of her sudden ejection at the point of the Dumpling's club.

When the eggs were safely stowed away in his desk, the pilferer summoned a council of his boon companions and broached the subject so dear to his soul. He commanded Buffles and Grubbins and Stodge and Guzzling Jim to attend his presence one day at the quarter-hour between morning lessons.

"Look here, you chaps! I vote I make a jolly dish of trifle. I've got some fresh eggs, and if you'll help get the other things you shall all have some."

"Hurray, Dumpling!" said Stodge. "What do you want us to get?"

"Well, there's sponge-cakes and strawberry-jam, and butter and sugar, and sherry and brandy."

"I'll make young Talbot stump up a pot of jam," said Grubbins; "he's just had a hamper."

"And I'll spend twopence in sponge-cakes if Punchey brings them this afternoon," said Jim.

"And I'll ask the cook to give me some butter and sugar," said Stodge.

"All right, so far," said the Dumpling. "So you must get the brandy, Buffles. I think we might perhaps make beer do instead of sherry. I'll manage that; but we must have brandy; you can't make it fit to eat without brandy."

"How can I get it?" asked Buffles. "Shall I tell one of the day-boys to bring some?"

"No, you ass!" replied the chief. "You'd better not say a word to any one else. You must get Mrs. Towels to give you some; she has it for fellows when they're ager."

"Well, all serene!" said Buffles; "I'll have a try. Where shall you make it?"

"I haven't quite settled that, but I think in the wood-yard out by the stables. Fellows don't often come there."

It was the Dumpling's orders that all necessary supplies should be procured before evening, so that things should be in readiness for the next day. He also directed that the contributions should be

put in a dismantled tea-chest among the lumber of the wood-yard. Furthermore, to add dignity to the proceedings, he consolidated himself and followers into a Society of Friends, to be designated, "The Jolly Guzzlers." He was to be president; Guzzling Jim, whose soubriquet suggested the title, vice-president; Grubbins, treasurer Stodge and Buffles had no distinguishing mark beyond the letters "M. J. G.," which they might append to their names in all epistolary communications with their superior officers.

The first meeting was fixed for the next day at 6.35 p.m., immediately after tea, in the dismal wood-yard, where, by the light of a dark lantern, they purposed consuming the dish of trifle, which the president announced he should be able to prepare in the wood-yard during the afternoon of the morrow.

The requisite ingredients were procured without any insuperable difficulty. Jim had been kept in for an imposition between two and three, and found all the sponge-cakes gone from Punchey's basket—only two stale currant-buns left. These he purchased and deposited in the tea-chest.

Buffles had been sore puzzled how to get round Mrs. Towels, the matron, for the brandy. I am thankful to say he would not tell a lie about it, and resolved

to ask point-blank. Mrs. Towels was very kind and indulgent to the boys, and seldom had the heart to refuse them anything asked within the bounds of reason, and these bounds she set with a liberal regard for the queer ideas of boys.

"So Buffles approached her with winning words and his most polite air. "Mrs. Towels, would you be so kind as to let me have just a little drop of brandy? I'm not going to drink it, but I want it very particularly. Please do!"

"Oh, my dear! whatever can you want brandy for? Oh! perhaps you want it to rub your chilblains;—a very good thing too, which I always recommend it myself. Yes; to be sure! I'll give you a bit of flannel. Now, Master Browne, don't you tease the cat, there's a dear young gentleman! Yes, Master Dawson, your cap is quite ready; I'll fetch it."

There were generally three or four boys in the matron's room requiring small attentions.

Mrs. Towels was going off to fetch the cap.

"The brandy, Mrs. Towels!"

"It's in the cupboard, my dear. You may take a little. Be sure you take the right bottle."

Buffles lost no time. He opened the cupboard and saw a phalanx of bottles of all sizes and shapes. He had a medicine-bottle and cork ready to hand. Three

among the host were black wine-bottles. He uncorked one of these and applied his nose—not quite sure. Poured a little into his vial—not the right colour. Tossed it into the fire. Buffles tried another. Oh, yes; that was brandy all right. He filled the vial and departed.

Alas! for the frailty of human judgment! This fluid which Buffles fondly supposed to be brandy was nothing else than the most abominable of pharmaceutical concoctions. It was the stuff known as "House Mixture," supplied by the school physician, and dispensed by the matron to boys suffering from a bilious attack.

Off hurried the deluded Buffles to the wood-yard, and found Grubbins just returning from the same errand. The others had all deposited their contributions, and the president was informed with due ceremony. He had borrowed a large earthenware dish of Mrs. Carey.

It was now 2.45 p.m.; there was a clear hour in which to prepare the trifle before school. The Dumping would not allow any member of the club to assist in the culinary operations. In solemn and solitary silence he took off his jacket, rolled up his sleeves, arranged the messes in order, and went at it with the no-nonsense air of a professional in the confectioner's craft.

(To be continued.)

SHOOTING THE RAPIDS.

YOU must not leave Montreal without first shooting the Rapids.

So said every one whom I knew in Montreal, as my visit to that picturesque old city was drawing to an unwelcome close; and as "what every one says must be right," I determined for once in a way to take advice.

Although vessels, even of the enormous draught of some of the Transatlantic liners, find ready anchorage and wharfage at the Port of Montreal, the city is situated at the very head of the (naturally) navigable waters of the mighty St. Lawrence.

About nine miles above Montreal is the little village of Lachine, and midway between the two extend for some five miles the far-famed Lachine Rapids, the longest, the swiftest, and the most dangerous on the St. Lawrence. A series of very fine locks permit vessels of certain limited draught to ascend and descend between Montreal and the navigable water above Lachine, but at certain times of the year many of the steamers prefer, on their downward trip, to "shoot the Rapids," and so effect a considerable saving both in time and in canal tolls.

To meet one of these steamers at Lachine, and run the Rapids in her to Montreal, is one of the favourite amusements of the tourist and visitor.

The village of Lachine in itself has little

to recommend it to the traveller beyond its lovely situation on the banks of the noble St. Lawrence. It is said to owe its name to the early French explorers of Canada, who were firmly convinced, when they had surmounted the Rapids on their voyage up the St. Lawrence, that they had discovered a new and direct route to Asia. On beholding the vast fertile plain extending back from the river's banks, they loudly exclaimed "La Chine! La Chine!" believing that they had arrived in China. But if not very attractive in itself, the ride to Lachine by rail is very pretty, and the high-road is one of the favourite drives of the Montrealers.

The best time of the year to shoot the Rapids is in the late spring. After the long winter the thawed snow and ice swell the volume of the river considerably, and the height and the speed of the Rapids are proportionately increased. Indeed the feat is very hazardous, and sometimes even impossible, in the late summer and autumn, especially after a dry hot season, when the water is too low to permit a large boat to pass down in safety.

Having finally fixed upon a day for the adventure, one lovely morning in the latter end of May I took train from Montreal, and in about half an hour arrived at Lachine. A very short time sufficed to explore the village, and as the steamer by which I intended to return was not timed to leave Lachine until evening, I took a boat and was rowed across the river to the celebrated village of Cagnetawaga. This settlement is peopled entirely by full-blooded but civilised Indians. They have schools, churches, shops, and every other feature of the white man's village, including unhappily the tavern. They farm and raise some stock, but the greatest part of their income is derived from the sale of curious knickknacks which they manufacture in endless variety. Embroidered moccasins, tobacco pouches, cigar cases, and countless trifles in woven grass, carved wood,

and birch bark, find a ready sale in large quantities amongst the numerous tourists who visit the settlement. The chief of the tribe is the proprietor of a grocery and general shop, in the parlour behind which he receives and entertains visitors in princely style.

Another very profitable source of income to the Indians is the piloting of the vessels which shoot the Rapids.

The channel is so narrow and tortuous, and the risks so great, that few white men will venture to run a boat down. But the Indian pilot, to whom every foot of the river is familiar, takes charge of the wheel with the utmost confidence; a confidence, it is only fair to say, which is very rarely misplaced.

After a pleasant chat with various members of the tribe, I was preparing to re-cross the river, but on learning that I intended to shoot the Rapids, the chief very courteously offered to put me on board the steamer in his own canoe, adding that he himself was engaged to pilot the steamer down. Although I had imbibed a very wholesome dread of the frail brown-papery-looking birch-bark canoe, which does duty as a boat universally on the upper waters, I accepted his kind offer, and shortly afterwards, seeing the smoke of the approaching steamer in the distance, we put off.

In the bow of the canoe knelt a stalwart, handsome young brave, wielding with great vigour and dexterity a short, broad-headed, single-bladed paddle. In the stern knelt the chief, also plying a paddle, and between them I, the passenger, crouched in a sort of Turkish cross-legged fashion on the bottom of the canoe.

Under the energetic strokes of the Indians a very short time sufficed to send the canoe across the river (which is here over a mile broad), and just as we reached the landing the steamer, slackening her speed, drew up to the wharf. I scrambled on board, nearly

upsetting the canoe as I did so, followed by the chief, who, with a nod to the captain, at once stepped aft and took the wheel. Following the instructions I had received, I made my way to the very prow of the vessel and awaited developments.

For the first few minutes nothing very striking occurred, save that as the steamer swung out into the current her speed rapidly increased, but after traversing rather more than a mile, as she turned a bend in the river, there lay the Rapids right in front of us.

With a speed already terrific, but always increasing, the boat dashed on. The first intimation I received that we had entered the Rapids was a heavy shower of spray as she dashed into the foaming, seething flood. Then all my energies were required to hold on to a friendly rope and hope for the best.

With racehorse, nay, with express-train, speed, the gallant boat plunged through the rushing torrent. At times her prow far out of the water and her keel shining in the sun. Again, a sudden shiver and a plunge as her bow buried itself in the waves and the stern in turn stood high. And all the time her huge paddles thrashing the foaming, raging river into even more maddened fury.

The rate at which the river flows down the Rapids has been estimated at about forty-five to fifty miles per hour. The steamer, in order to have some steerage-way upon her, that she may be obedient to her helm, must go still faster than the current, so the average rate for those five miles of Rapids cannot be much under a mile a minute.

About halfway down the river is divided into two branches by a green and tree-covered islet. One side of this islet consists of a huge mass of jagged rock, and for this rock the pilot held the steamer right head on. Involuntarily I let go the rope by which I was holding, and gathered myself together for a spring the moment she touched; it seemed as if all hope was gone.

Driving at terrific speed through such raging water it did not seem possible that

wrenching swoop, like a swallow on the wing, the good boat spun round, her paddles revolving at racing speed, and with the dart of an arrow she shot across the river.

The Indian Pilot.

So close did she pass that the overhanging boughs of the island trees brushed her paddle-boxes as she dashed by.

It seemed a very near touch, but the only practicable chance through the middle Rapids is the direct course we took. Should the helmsman lose his nerve at the critical moment, should the boat refuse to answer her helm, or the engines to act in accordance with the pilot's orders, nothing but absolute destruction can result. But the calm self-possession of the Indian pilot, the unceasing watchfulness and implicit obedience of the steamer's hands, and the careful supervision all her parts regularly receive, bring the

plain sailing. The landsman, fortunately for himself, cannot see the cruel submerged rocks, with their jagged edges ready to tear the whole bottom from the stoutest-built boat, and the swift cross currents, powerful enough to drag the strongest steamer from her course, hurl her into the foaming breakers above the rocky reefs, and dash her into a million pieces.

But to the trained eye of the pilot all these are as clear and evident as the steamer's deck. With never-relaxing vigilance his gaze is fixed ahead on signs and guiding marks known only to himself.

Backwards and forwards, with never ceasing motion, turns the great wheel, its spokes grasped firmly in his sinewy copper-coloured hands. Constantly sounding, too, is the engine-room signal bell, conveying his instructions to the men in charge of the engines.

And beautifully the boat behaves. Darting hither and thither in obedience to her helm, she threads the mazy lines of rocks and currents, always on the very edge of destruction, but always, just when it seems all hope is gone, shooting back into safety.

However, at the speed we have come at, even five miles of Rapids must soon be passed. Now the steamer's speed is perceptibly slackening, and as we glide under the grand Victoria Bridge—the wonderful tube (only some sixty yards short of two miles in length) which the celebrated Robert Stephenson designed and built across the St. Lawrence at a cost of about £1,300,000—into the calm but still swift current of the lower river, we look at our watches.

"What! Only twelve minutes from Lachine! Why, it seemed hours. Hours certainly we hung dead stern on to that great island rock!"

But no; in twelve minutes we have run down about eight miles; three of them at rapid speed certainly, but five of them in not much more than five minutes!

The remaining mile to the steamer's wharf is done at a much more leisurely rate, and

Shooting the Rapids.

any human power could avert the apparently impending calamity.

We were within twenty yards of the rock. Already one could see the mosses and lichens which clad its crannies, when, with a sudden

vessel through in entire safety nine hundred and ninety-nine times out of a thousand.

After the islet reach is passed, although the dangers are by no means over, to the inexperienced eye all seems comparatively

as she swings steadily in to the landing-place, amid all the noise and bustle of passengers preparing to land, I hear the captain heave a deep sigh of relief.

I don't wonder either.

ARMOUR IN HISTORY AND ROMANCE.—See p. 25.

By JOHN SACHS.

PURPOSE, at the suggestion of our Editor, giving a brief but thoroughly trustworthy description of the different kinds of armour used in times past.

We commenced our pleasant task by obtaining permission from the Secretary of State to sketch examples in the Tower of London; and we also selected and engraved from the specimens, man-

uscripts, and sculptures in the British Museum, as well as gathered from other authentic English and foreign sources, the facts which we hope will at once entertain and instruct our boy readers the world over.

In remote times, as man felt the danger to life from the club, pointed stick, arrows from the bow, and missiles from the sling, he, in self-defence, according to his resources and means, invented coverings for the head and body proof against these weapons. We have, of course, all read the eleventh chapter of Genesis and thirteenth verse, which shows that the Israelites were acquainted with the bow at a very early period, and probably used shields and some kind of defensive armour. We can see what they were like from the ancient Egyptian paintings and sculptures.

Fig. 1 represents an Assyrian warrior at a triumphal entry after the conquest of a city. He is holding up a shield, the handle of which is across the inside of the central boss. Remains of actual Assyrian shields now in the British Museum show that the boss, or umbo, were sometimes constructed of iron, and are remarkably like the remains of shields found in Saxon graves in England. The caps of the ancient Assyrians were probably of leather, but the shape was imitated in metal, as we shall presently show. On their bodies is fitted a sort of corselet, probably of horn-plates, sewn on leather; their legs seem defended likewise.

Fig. 2 shows two Assyrians in a similar costume. One holds a spear in one hand,

and in the other a tall shield, which is curved at the top for the purpose of glancing off arrows and missiles. Behind this defence the front figure is shooting upwards with a bow and arrow.

Fig. 3 also represents a slinger in military habit, but he has a strap over his shoulder for carrying a receptacle for stones. These sculptures date about the period of the prophet Daniel, and probably illustrate the arms and armour of a century previous.

In 1 Sam. chap. xvii., we have an early example of a battle decided by single combat. Goliath is described as having a helmet of brass, being armed with a coat of mail of heavy weight, greaves of brass or bronze upon his legs, and a target or gorget between his shoulders, the staff of his spear being like a weaver's beam, and one bearing a shield going before him. Well, Fig. 4 is copied from the actual remains of an Assyrian helmet found at Kojoungik, and preserved at the British Museum. The pattern is like the caps on the soldiers above illustrated. This helmet is of bronze, further strengthened with bands of iron. The whole when bright and polished must have had a brilliant effect. Around the bottom of the helmet are the remains of a camail, or cape, constructed of iron rings, that was attached to the helmet and spread over the shoulders. This example shows the early use of chain-mail, of which defence we shall have more to say.

Fig. 5 is from an early Roman example, and shows a transitional, or mixture of two fashions, the cap pattern giving place to a crested helmet, the body-dress similar to the Assyrians, which was called by the Romans Lorica, but the greaves to the legs are of bronze.

As the art of working in metals was developed, the cuirass was made in two pieces only. An early example (Fig. 6) can be seen on a Greek earthenware plate exhibited in the British Museum, and is supposed to date 600 B.C. The subject represents a combat between Menelaos and Hector over the wounded Euphorbos. These Homeric names are inscribed in Archaic Greek letters over the figures. Their helmets are made to cover the whole head and are curved at the back for the convenience of holding the head upwards; a mask pattern is on the front with apertures for sight and breathing. From the stiff appearance of the cuirass and greaves they are evidently intended to represent metal.

Later the Greeks moulded the cuirass anatomically to fit the figure, which fashion lasted throughout the Greek to the decline of the Roman Empire. Fig. 7 is from a specimen in the British Museum. The helmet has a metal piece to protect the face. The decorated greaves remind us of the elaborate designs Vulcan worked on the armour he constructed for Achilles. This specimen probably was similar to the armour that Titus

wore before Jerusalem, where he twice saved an entire Roman legion when in jeopardy by his courage and skill in arms. He must have been quick in his sight and ready, for Josephus relates that once Titus went to view the city of Jerusalem without taking

Fig. 7.

the precaution of wearing armour. He was observed by the Jews, who shot darts at him which he diverted with his sword.

The coming of an armed man (Prov. vi. 11) must have been a terror in those days. This was the armour that the Apostle Paul bore in his mind when he wrote in his Epistle to the Ephesians, vi. 13 to 17, "Wherefore take up the whole armour of God, that ye may be able to withstand in the evil day, and, having done all, to stand. Stand therefore, having girded your loins with truth, and having put on the breast-plate of righteousness; and having shod your feet with the preparation of the gospel of peace; withal taking up the shield of faith, wherewith ye shall be able to quench all the fiery darts of the evil one. And take the helmet of salvation, and the sword of the Spirit, which is the word of God."

(To be continued.)

MY PARROT.

MANY are the wonderful and amusing tales told about parrots, some of which one must receive with caution. There are birds who by a marvellous degree of intelligence seem always to say the right thing at the right time. This wonderful gift I do not pretend to claim for my parrot; still I am bound to say that she is a most amusing bird.

Polly is a grey parrot, a native I believe of the West Coast of Africa. She has now been in my possession about three years, having

been brought from Madeira in her infancy, by a friend on his voyage from England to the Cape. Finding, however, on his arrival in Capetown that he would have to proceed some distance up country, he most kindly made me a present of the bird.

By degrees Polly lost her wild and timid nature, and is now most tame and affectionate. Nothing delights her more than to have the top and sides of her head gently rubbed, for which purpose she will always come to one side of her cage, and seems ab-

solutely to thrill with delight under the operation, turning her head in every direction and pecking gently at my fingers. At one time she was very fond of screaming out, "Scratchy pole," which she had learnt from me, and always seemed to associate with this head-rubbing. I often now do the same thing under her wings, for which purpose she will always raise them, and gently peck my fingers the while. She also allows me to take her out of the cage, and will climb to my shoulder and place her beak against my

cheek and lips in a most affectionate manner. I might still describe many of her interesting and amusing tricks, but will tell you instead a little about her talking powers.

Of course the ABC of this branch of her education was (as it is in the case of so many human parrots) admiration of self. "Polly," "Pretty Polly," "Pretty birdie," "Dear old birdie," and so on. All these she will repeat in every imaginable tone of voice. I remember one morning about twelve months ago I came downstairs from my room and was reading the morning paper just inside the hall door, Miss Polly being in her cage outside on the stoep. While reading I heard as I thought the voice of Doctor C. (the gentleman of the house) speaking to Polly as I had often heard him: I therefore looked round the corner with the intention of wishing him good morning, but to my surprise Polly was the only individual there, and she it was who had so exactly imitated my friend's voice. This gentleman is now dead, but I still often hear Polly praising herself in precisely the same tone of voice. At the same house we had a lemur, or Madagascar cat, which, though a very pretty little creature, was not only treacherous in its temper, but also possessed a most atrocious voice, very much like that of a cat in a bad temper. This, I am sorry to say, Polly at once picked up, and seemed to irritate the lemur exceedingly by her mockery of it. She also imitated very naturally the yelping of a small dog. I am glad to say she seems to have forgotten the lemur's melodious cry, though she still occasionally mews and barks very naturally.

After I left the friends with whom I was staying I took private rooms, and here Miss Polly was a very pleasant companion, especially at my lonely meals. She seemed quite to look forward to evening, when I always let her out and allowed her to stand on the top of her cage close to me. Here she had literally a "bird's-eye" view of the table and its contents, and sometimes, if I put her within reasonable distance, would stretch out one leg to its utmost extent, and by aid of claws and beak obtain a footing on the table, when she seemed to imagine that everything was her peculiar property, though the milk-jug was the object of her more special attention. I always gave her some bread and milk when I had finished my own meal, and directly she saw me preparing it and heard me say, "Is this for Polly?" down she would walk from her exalted position, enter the door, and wait anxiously for me to fill her tin.

During this time I taught her several sentences, such as "You donkey," which she ever after seemed to delight in calling me, laying special emphasis on the quadruped's name. She would then indignantly scream to be released from captivity, "Let me out," "You let me out," or would all at once appear very anxious to dispense with your company altogether, shouting out, "Get away," "You get away."

I have now left these rooms, and am living with an old friend whom I knew well in the dear old home country. Between us Polly's education proceeds rapidly. Mr. H. is fond of attempting to pull Polly's red tail, of which she is very vain, and it is most ludicrous to see her skip about in her cage in order to escape the indignity. It occurred to me on seeing this to teach her the sentence, "You let my tail alone!" which she is now never tired of repeating in the most emphatic manner, though I must say it is always when no one is thinking of attempting such a thing. The stress she lays upon the word *tail* is most amusing. "Let my *tail* alone! You let my *tail* alone!"

At one time she very much hated a stick, especially if one attempted to poke her with it, when she would scream most indignantly. She now, however, is so accustomed to it that she will even allow it to be rested on her back, or her head to be rubbed with it. I think, as a rule, it is very unwise to tease, because it is liable to make the bird treacherous and bad-tempered, but no teasing seems to have such an effect on my parrot. Indeed, she appears rather to enjoy it than otherwise. She is now while I am writing screaming out the inquiry, "Who are you?" and persists in doing so though I have constantly told her that "I am the owner of a very noisy bird."

The chief times for displaying her conversational powers are early in the morning, about three in the afternoon, and at sunset; indeed, such a noise does she make that my friend has nicknamed her "the old chatter-box," of which title she so much approves that she is never weary of repeating it.

One more amusing point I must mention, and that is that she appears at times to confuse her sentences, or stop in the middle, as if uncertain whether she was correct in her statement. For example, I have heard her confuse the two sentences, "You donkey!" and "Dear old Polly!" in this way: "You—dear old Polly!" or again, having repeated the vowels (for she has commenced her alphas-

bet), she will end by calling you a donkey, thus, "A-e-i-o-u—donkey!" She will also at times omit a syllable or word altogether, making the sentence sound very ludicrous. For instance, "You donkey!" is sometimes "You donk . . .!" "You let my *tail* alone!" is "You let my . . . alone!" and so on.

It is most amusing also to listen to her when talking to herself, which if no one is near she occasionally does, in a kind of *confidential* tone which it is impossible to make anything of, but which reminds one of the common "Punch" call. Her whistling powers are also very remarkable, the tones being exceedingly rich and varied, and sometimes in the evening, when I open my room-door and the light from the lamp streams on to her cage, there is a preliminary flutter of her wings, a low kind of amused chuckle, and she then breaks out into a whistle such as I have described, generally ending up when the door is shut with a low-toned and confidential "Polly!"

In conclusion, I need hardly say that the above sketch is not in the slightest degree exaggerated, nor though I have been told by others of many more accomplishments possessed by Polly, I have been careful to relate nothing which I have not heard or seen myself. Polly is certainly a most amusing and affectionate bird, but I do not, as I said before, claim for her anything but a degree of intelligence (if we may so call it) greater perhaps than that possessed by the majority of parrots, and, as I have often told my pupils, nearly equal to that of many boys I know. As to the best way of teaching parrots to talk, I perfectly agree with a statement I read in the BOY'S OWN PAPER some time ago. Try and gain the bird's affection by kindness, and always taking care to feed it yourself. Just one word before I end, on a question about which there seems to be a great diversity of opinion, "Is it a good thing to give parrots water?" I never do so myself, though I always give her bread moistened with milk morning and evening and a few mealies (known to you as Indian corn or maize) at midday. Of course I also give her fruit when possible. Grapes, of which in season there are plenty at 1s. 6d. per bushel basket, she is particularly fond of.

As regards the water question, an old lady who had a parrot nearly twenty years assured me that she never gave her any water at all.

Capetown, South Africa.

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

By JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER II.—TO THE DIAMOND FIELDS.

WHAT most humiliated the young engineer in the answer he received from Mr. Watkins was the fact that, in spite of the rudeness in which it was couched, the decision was not unreasonable. When he came to think matters over he was surprised at himself for not having seen the farmer's very obvious objections.

But the fact is, that up till then he had never dreamt of the difference of fortune, race, and education between the young lady and himself. Accustomed for the last five or six years to regard minerals merely from their scientific point of view, diamonds were in his eyes but specimens

of carbon adapted for exhibition in the museum of the School of Mines. In France he had moved in quite a different social circle from what he did here, and he had quite lost sight of the commercial value of the rich mine possessed by the farmer. The thought that there was a difference in station between the daughter of the owner of Vandergaart Kopje and himself had never entered his head.

The sharp reprimand he had received from Watkins awoke him from his illusion. Cyprien had too much sense not to appreciate the farmer's reasons, and too much honesty to be angry at a decision

which he admitted was, in the main, a just one.

But the blow was none the less severe, and now that he had to give up Alice he found how dear she had become to him in those three months. For only three months had elapsed since his arrival in Griqualand.

How far off it all seemed!

Landing with his friend Pharamond Barthes—an old schoolfellow who had come out to South Africa on his third hunting and exploring expedition—he had separated from him at the Cape. Barthes started for Basutoland to engage an escort; Cyprien secured a seat in the

heavy, lumbering, fourteen-horse waggon—the stage-coach of the Veld—and set out for the Diamond Fields.

Five or six huge cases—a complete chemical and mineralogical laboratory, from which he was very loth to part—formed the luggage of the youthful scientist; but the coach only allowed a hundredweight of luggage to each passenger, and he had consequently been obliged to entrust his precious cases to the tender mercies of a bullock cart.

The “coach” held twelve passengers. It was covered with a canvas til, and had four enormous wheels constantly wet from crossing the fords. The horses, which were occasionally replaced by mules, were harnessed in pairs, and driven by two coachmen seated side by side on the front bench. One held the reins while the other manipulated a tremendously long bamboo whip, not unlike a huge fishing-rod, and used it to guide the horses as well as to urge them on.

The road goes by Beaufort, a pleasant little place at the foot of the Nieuwveld

rock cropping out from below, half-starved-looking bushes, and here and there a stunted sickly plant. At long intervals a few dilapidated farms doing duty for inns. The hospitality of these inns is somewhat rudimentary. The “good accommodation for man and beast” comprises neither a bed for the man nor litter for the beast, and the provisions are tinned ones that have gone the round of the world, and sell at the buyer's risk for their weight in gold.

There being nothing for the horses at the farms, the teams are unharnessed and allowed to wander about in search of their own food. They have to be caught again before a start can be made, and the loss of time thus occasioned may be imagined.

Great is the jolting of the primitive coach along the still more primitive roads. The seats are the lids of the wooden lockers which hold the light luggage of the passengers, and on them for a week or more their possessors go thump-jump like so many forge hammers as the waggon rolls along. Impossible to read,

Nathan, an expert in diamonds, who kept himself quiet in a corner and looked upon humanity like a philosopher; a tall collier, Thomas Steel, with a red beard and broad shoulders, who had left his native Lancashire to try his fortune in Griqualand; a German, Herr Fredel, who spoke like an oracle and knew everything about diamonds and diamond digging—in theory; a thin-lipped Yankee, who reckoned to open a canteen and persuade the miners to waste their hard-earned wealth; a farmer from the Hartz; a Boer from the Orange Free State; an ivory trader on his way to Namaqua Land; two Transvaal colonists; and a Chinaman named Li—like every other Chinaman—made up the most heterogeneous, noisy, and disorderly company in which it was ever given to a man to find himself.

At first Cyprien was amused, but not for long. There was only Steel with his massive strength and loud laughter, and Li with his gentle catlike ways, in whom he continued to take the slightest interest. To the Neapolitan, with his spiteful buffooneries, he felt the strongest aversion.

One of the most popular jokes of this personage consisted in his tying on to the Chinaman's pigtail, whenever he got an opportunity, a collection of miscellaneous objects, such as bundles of greens, cabbage-stalks, a cow's tail, and a horse's bladebone, picked up on the road.

The Chinaman unconcernedly removed the articles from his appendage, and neither by word, look, nor gesture showed that he considered the pleasantry beyond the bounds of propriety. His yellow face and little almond eyes were as unalterably placid as if he were quite a stranger to what was passing around him. In fact it seemed as though he understood not a word of all that was spoken in this Noah's Ark bound north for Griqualand.

And Annibale Pantalacci, in his broken English, was profuse in his very vulgar witticisms on the same subject, and kept the travellers in a roar of laughter. What made the laugh all the longer was that the Boers invariably took some time to see the joke, and burst out noisily about three minutes after everybody else.

Cyprien at last became indignant at the dead set thus made against the unfortunate Li, and told Pantalacci that he ought to be ashamed of himself. The Neapolitan would probably have made some insolent rejoinder, but a word from Steel put a sudden check on him.

“No,” said the Lancashire man, regretting that he had laughed with the others, “it isn't fair play to keep on like that at a chap who doesn't even understand your lingo.”

Here the matter dropped for a time. But a few minutes after Cyprien was surprised to see the quietly ironical look of thanks with which the Chinaman regarded him, and which made him think that Li knew rather more English than he gave him credit for.

But it was in vain that at the next halt he tried to engage the Chinaman in conversation. Li remained mute and impassible. Henceforward the young engineer looked upon him as an enigma whose key might be found with perseverance, and made a constant study of the smooth yellow face, the mouth like a sword-cut opening on to the row of very white teeth, the short broad nose, the

“One of the most popular jokes of this personage.”

Mountains, across the hills to Victoria, then to Hopetown on the Orange, and thence to Kimberley and the principal diamond centres, which are but a few miles away from it.

It is a wearying, monotonous journey across the Veld, and takes from eight to nine days. The landscape is most miserable—red plains, scattered stones like moraine rubbish on the surface, and grey

impossible to sleep, nay, even impossible to talk!

Cyprien's fellow-travellers were fairly representative of the floating population peculiar to gold and diamond fields. There was an ungainly Neapolitan, with long black hair, a face like parchment, and a pair of glittering treacherous-looking eyes, who said his name was Annibale Pantalacci; a Portuguese Jew named

large forehead, and the slanting eyes always cast down as if to hide the latent malice in their look.

and stockings of immaculate whiteness, might have belonged to a mandarin of the first class or to a man of the people.

"Bound north for Griqualand."

What age was Li? Fifteen or sixty? Impossible to say. If his teeth, his eyes, and his hair black as soot, made him look quite young, the wrinkles in his forehead, his cheeks, and even round his mouth, gave him the appearance of an old man. He was short and of slight active build, and seemed to be rather a good sort of fellow than otherwise.

Was he rich or poor? Another dubious question! His grey trousers, yellow blouse, plaited string hat, felt-soled shoes,

His luggage consisted of a solitary red box with an address in black ink,

"H. Li,

"From Canton to the Cape."

The Chinaman was the very pattern of neatness, never smoked, nor drank anything but water, and took advantage of every halt to carefully shave his head.

Cyprien found he could make nothing of him, and soon gave him up as a mystery.

(To be continued.)

AN EVENING AT THE IVY.

BY THEODORE WOOD.

PART II.

WITH such pleasant recollections thronging into our memory, the lantern is lighted, a supply of boxes placed ready to hand, and our companion takes the net, which is to be held beneath the blossoms under examination in order that the designs of the artful ones may be frustrated. Cautiously and hopefully the light is turned on to the nearest flower, just in time to see one of the beautiful *Xanthia* moths, which had been fluttering over the blossom, take hurriedly to flight. No matter, however; he had only been experimenting, and is sure to return before very

long, for he must be unusually strong-minded if he is able to resist the seductions of the fragrant bloom.

Only an inch or two farther away is a specimen of the Red-line Quaker (*Orthosia lota*), resting side by side with an Angle-shades (*Phlogophora meticulosa*). Both insects are busily engaged, and are so absorbed in their occupation that the glare of the lamp-light is not sufficient to check their repast for a single moment. Nor does the Angle-shades deign to move even when his companion is pill-boxed, seeming to feel that he himself is

far too common an insect to be at all likely to share a similar fate. We do not abuse his confidence, and leave him still in the hearty enjoyment of his repast.

A couple of earwigs are hard at work upon an adjacent flower, and keep constantly shifting their position, as though to ascertain by the most satisfactory test—that of personal experience—the very best position for extracting the sweet juices. Hard by the two explorers is a large spider, evidently upon the look-out for victims, for he, at all events, is not likely to be contented with a vegetarian diet, even though the banquet consist of veritable nectar. Perhaps he will try conclusions with one of the earwigs, in which case a very sharp little battle will probably be the result.

Upon the very next blossom is another of the *Xanthias*, a splendid specimen of the Pink-barred Sallow (*X. silago*), perhaps the most exquisite species of this beautiful genus, with its orange wings traversed by markings of richest purple. One rapid movement of the finger and thumb and his fate is sealed, a second pill-box being immediately handed to us by our companion, in readiness for another victim.

Here is a shocking example of the evils of intemperance in the form of a belated butterfly, which, either unable or unwilling to leave the tempting repast at the approach of darkness, is now in a hopelessly maudlin condition, inert and sluggish, and falling helplessly to the ground when we forcibly remove him from his perch. Well, he must take his chance, but it will be odd indeed if some wandering toad, or other untiring foe of the insect race, does not snap him up before he has slept off the effects of his debauch.

Common moths are in plenty, for darkness has now fairly set in, and new visitors arrive in a constant and unbroken stream. All around us are dusky forms flitting to and fro, now dimly outlined against the sky, and now visible only by reason of the refulgent lustre of their eyes, which look like so many minute globes of liquid fire as they reflect back the light of the lantern. Almost every blossom, too, is tenanted by one or more occupants, and the overcrowding upon certain favoured sprigs of bloom is sometimes quite amusing to witness.

Here is something worth having at last in the shape of a magnificent specimen of the Pearly Underwing (*Agrotis saucia*), a large and somewhat clumsy insect about the size of the common Yellow Underwing. This is by no means a common species, and we are very pleased when he is safely installed in a commodious pill-box, and transferred to the coat-pocket set apart for captures.

There are plenty of such common things as Chestnuts (*Glaea*), Yellow-line Quakers (*Orthosia macilenta*), Angle-shades, and so on, diversified every now and then by a *Xanthia* or a delicate Marbled Carpet (*Cidaria rusata*). Here and there, too, is a Sword-grass (*Calocampa exoleta*), looking, as the Rev. Joseph Green happily puts it, not unlike a sausage, while Yellow Underwings (*Triphaena*), Small Square-spots (*Noctua rubi*), Lunar Underwings (*Anchocelis lunosa*), Beaded Chestnuts (*A. pistacina*), and various others, are occasionally met with. We get a nice series of the Brown-spot Pinion (*A. litura*) also, as well as several beautiful specimens of the Green-brindled Crescent (*Miselia oxyacantha*), which are very welcome to replace the damaged examples at present in our collection.

With all these captures, our store of empty pill-boxes is fast decreasing, and we are obliged to pass by many insects which we should otherwise have taken in order to leave room for any occasional rarity with which we may be fortunate enough to meet. Well is it for us that we did so, as it shortly turns out, for a beautiful specimen of the Orange Upper-wing (*Hoporina croceago*) is discovered intent upon making the best use

of his time at a peculiarly luxuriant blossom. Now we find the advantage of insisting that the net shall always be held in readiness beneath every blossom as it is examined, for our friend *croceago* drops as soon as the lantern light is turned upon him, and is intercepted and pill-boxed as rapidly as though he had allowed himself to be captured in the ordinary manner. This is a prize indeed, being by far the best insect with which we have met this evening, and as it is a new species to our collection we are greatly elated in consequence. Hopes of further specimens urge us on to further exertions; but these hopes, alas! are doomed not to be realised.

Another intoxicated butterfly is detected before we leave, and shares the same fate as his predecessor. One or two bees and wasps, too, we find in the same condition of hopeless drunkenness, with but just sufficient strength remaining to cling feebly to their footholds. Some of the moths, too, which were earlier visitants than their comrades, and have consequently enjoyed greater opportunities for tipping, are beginning to show pretty evident signs of having absorbed as much as is good for them, for no amount of touching and poking will cause them to take to flight, or even to fall to the ground. Two or three more of these find their way into our boxes,

but one of which now remains empty, and this we reserve in case of meeting with something while on our homeward way.

And so, after a couple of hours or so of pleasant and exciting work, we bid farewell to the ivy, and set out upon our return journey. We have seen no Dotted or Red-headed Chestnuts, it is true, but we have got *croceago*, as well as several lesser rarities, and have therefore no cause to feel discontented. And, long ere we reach home, we resolve that before the season is over we will try our luck again, and see whether we cannot do still better while enjoying another evening at the ivy.

AMONG THE BLACKS;

OR, STRANGER THAN FICTION.

the few cases of white men abandoning civilisation to live for a time among the Australian Blacks, none is more interesting than that of the shipwrecked cabin-boy, Narcisse Pellatier.

Pellatier was the son of a shoemaker at Saint Gilles, near Bordeaux, and, in 1858, was cabin-boy of the Saint Paul, a French vessel then on a voyage from China to Australia with three hundred and fifty Chinese emigrants. All went well with the Saint Paul until she was off the south-east of New Guinea, when, as she was passing through the Louisiade Archipelago she struck on a reef and became a total wreck. Fortunately no life was lost and all got safely to shore.

The boats, however, were insufficient to carry more than the crew, and the captain, feeling uneasy at remaining on an island liable to be swooped down upon at any time by a band of reputed cannibals, resolved to leave his passengers behind him and take his crew to the Australian coast. The unfortunate Chinese were consequently abandoned, and the boats started on their six-hundred-mile sail.

The natives of the archipelago did not belie their reputation. They soon discovered the Chinese and made them prisoners, and then proceeded to feed upon them. In the most deliberate manner they killed off the Celestials two at a time, and out of the three hundred and fifty no less than three hundred and thirty-four had furnished forth the cannibal banquet when the sixteen survivors were discovered by a passing vessel, and rescued from their horrible fate.

Meanwhile the boats of the Saint Paul had successfully crossed to the mainland, and reached First Red Rocky Point, a little south of Cape Direction on the Cape York Peninsula. Here, after a short stay, the captain abandoned Pellatier, as he had abandoned the Chinamen, and put to sea to make his way down the coast. The selfish Frenchmen were never heard of again; a storm came on, and the boats were probably swamped.

The Blacks at Cape Direction found the boy asleep. Seeing he was hungry they gave him food, were kind to him, and took him off with them to their huts. With them he lived for seventeen years, fishing, hunting, and fighting with the neighbouring tribes.

He was discovered on 11th April, 1875, by the crew of the John Bell, pearl schooner, then at anchor off Night Island. He was quite naked, his body had darkened to a rich brown-red, his skin was glazed, and his breast was tattooed with scarifications as thick as a pencil, and in the lobe of his right ear was a piece of wood half an inch thick and four inches long. Of his tattoo scars he was very proud; they had been made with pieces of quartz, and in order to get the relief the lips of the cuts had been raised by constant pinching during the healing process.

He was very loth to leave the Makadamas—such is the name of the tribe in that part of Northern Queensland—and they were very sorry to lose him. He had retained his knowledge of reading and writing, could count up to a hundred, and drew excellent sketches of the animals he had hunted during his long spell of savagery. At first, he said, his thoughts often reverted to his father and mother and the home he had left, but as the years rolled by all such ideas faded from his mind, and he became thoroughly identified in thought and action with the aboriginals. Sudden as was the change to civilisation, he bore it with equanimity, and returned to France, where, according to the latest advices, he is still alive.

Another famous instance of life with the Blacks is that of William Buckley, "the Wild White Man of the Australian Bush," who died in Hobart in 1856. Buckley had been one of the conspirators to assassinate the Duke of Kent at Gibraltar. He was transported in 1803, and went to Australia in the fleet under Governor Collins, the first sent out to settle Port Philip. On the 27th of December of that year Buckley and several of the other convicts escaped, and Collins had in consequence to abandon the settlement. Buckley lived with the Blacks for thirty-two years, and when found in 1835 by the first permanent settlers, had almost forgotten his language, and was in every respect a savage. In a short time, however, he became fairly re-civilised, if we may use such a term, and became a native interpreter. One result of his savage life was a great increase in his height, his stature in his later days being no less than six feet five inches.

Another famous case is that of James Davies, the Scotch blacksmith, who was transported in the Minstrel in 1824. He had been sent up to Moreton Bay, and absconded with a companion from Captain Logan's exploring party. His companion was killed for desecrating the graves of the natives, but

Davies ingratiated himself with one of the tribes and lived with them for fourteen years, returning to civilisation in 1842.

Morrill was seventeen years with the savages. He was one of the crew of the barque Peruvian, of Dundee, which on the 8th of March, 1846, when commanded by Captain Pitkelly, on a voyage from China to Sydney, was wrecked on the Horseshoe Reef near Port Denison. The crew, twenty-two all told, escaped on a raft, and drifted about for forty-two days. Their sufferings were fearful, and only seven men survived to be washed ashore near Cape Cleveland. Of these, six shortly afterwards died, and Morrill was left alone. He joined the Blacks, and in January, 1863, made himself known to some North Queensland stockmen, by whom he was rescued. He did not long survive his release, and died at Port Denison, near which he had been wrecked, in October, 1865.

The discovery of the Brisbane River is due to another case of living with the aboriginals. On March 21st, 1823, Thomas Pamphlet, with three companions, Thompson, Parsons, and Finnegan, left Sydney in a coaster for Illawarra. They were blown out to sea by a sudden storm. On the sixteenth day Thompson died raving mad for want of water, and on the twenty-fourth they reached land. Thinking they were to the south of Sydney, they journeyed northward, and made their way to Moreton Bay, where, Parsons having died, Pamphlet and Finnegan spent five months with the natives. They were discovered by Oxley, in the Mermaid, on November 29th, 1823, and to him they gave the information as to the Brisbane.

This Mermaid was the Government cutter whose last crew met with such a succession of disasters on the 29th of October, 1829, when, under the command of Captain Nobrow, she was wrecked in Torres Straits. All on board were saved on the rock, and three days afterwards the Swiftsure, from Tasmania, under Captain Johnson, took them off. Three days after that the Swiftsure was wrecked, and the two crews were, after a few days had elapsed, picked up by the Governor Ready. Strange to relate, on May 18th the Governor Ready was wrecked, and the three crews betook themselves to the boats, to be picked up by the Comet. Their chain of misfortune was still incomplete, for in a few days the Comet was wrecked, and the four crews were saved by the Jupiter. Even this was not the end of their adventures, for the Jupiter came to grief at the entrance of Port Raffles Harbour, and the five crews had to get to land in boats. Perhaps the strangest thing of all was that not a life was lost in all these perils, and that all the five crews reached home safe and sound. The wreck of the Mermaid is almost worthy of a place amongst "The Great Shipwrecks of the World."

GO-BAN.

BY HERR MEYER.

(Continued from page 6.)

THE following two games were played on the 11th of last January between G. W. S. and H. F. L. M.:—

WHITE.	BLACK.
1. d 4.	d 5.
2. e 4.	e 5 (i).
3. f 4.	c 4 (j).
4. f 5.	e 6.
5. f 7 (k).	f 6.
6. g 6.	d 3.
7. g 4.	h 4.
8. g 5.	g 3.
9. e 3.	g 2.
10. e 5.	f 2 (l).
11. e 2.	f 3 (m).
12. b 3.	g 7 (n).

The men are now placed as shown in this diagram:—

Now the moving begins:—

13. b 3 c 3.	f 2 e 1 (o).
14. e 2 f 2.	d 5 c 6.
15. f 2 e 2 (p).	e 1 d 1.
16. e 5 d 5.	d 1 e 2.
17. d 5 c 5.	c 2 b 3.
18. f 7 e 7.	e 5 d 5.
19. e 7 f 7.	d 2 c 2 (q).
20. e 2 d 2.	g 7 h 6.
21. c 3 b 2.	c 2 c 1 (r).
22. g 6 g 7.	f 6 g 6.
23. g 5 f 6.	e 6 e 7.
24. g 7 f 8 = five.	

NOTES.

(i) Experience has shown that it is best to occupy the central squares, for the men then have the greatest freedom of action.

(j) This move is necessary, for if Black had placed the man on e 5, White would have won by placing his next man on c 4 or g 4.

(k) He must block the line a 2 g 8, just as well as Black must now block the f file.

(l) The last six moves were all forced for Black.

(m) A weak move, which places the black men awkwardly. He would have done better to place it on b 3 in order to force the last white man to go to a 2, and then Black could have placed his last on c 3, and try to make a "five" in the a 5 e 1 or the a 6 f 1 or the c file.

(n) Necessary, for if placed on b 6 or a 5, White would have won thus:—g 6 g 7, f 6 g 6, g 5 f 6, followed by g 7 f 8.

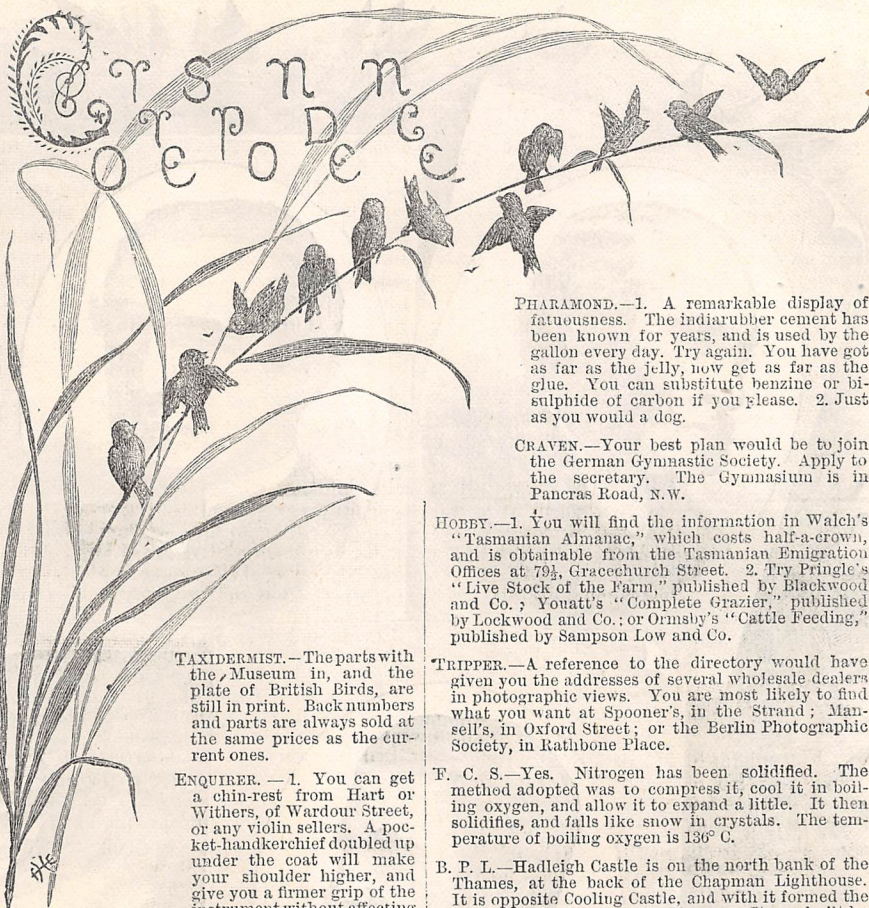

(o) Endeavouring to bring this man to the other side of the board.

(p) He is afraid of e 1 e 2.

(q) A bad move, for although he can block at h 6, he can afterwards not stop the g or f file. Black should have tried to move from c 6 to a 2.

(r) Must. White now wins easily, even if e 6 stood on e 7, for g 6 g 7, e 7 f 8, f 7 g 8, f 6 g 6, f 4 e 5, g 6 f 6 (else f 5 f 6), f 5 g 6.

(To be continued.)

PHARAMOND.—1. A remarkable display of fatuousness. The indiarubber cement has been known for years, and is used by the gallon every day. Try again. You have got as far as the jelly, now get as far as the glue. You can substitute benzine or bisulphide of carbon if you please. 2. Just as you would a dog.

CRAVEN.—Your best plan would be to join the German Gymnastic Society. Apply to the secretary. The Gymnasium is in Pancras Road, N.W.

HOBBY.—1. You will find the information in Walch's "Tasmanian Almanac," which costs half-a-crown, and is obtainable from the Tasmanian Emigration Offices at 79½, Gracechurch Street. 2. Try Pringle's "Live Stock of the Farm," published by Blackwood and Co.; Youatt's "Complete Grazier," published by Lockwood and Co.; or Ormsby's "Cattle Feeding," published by Sampson Low and Co.

TRIPPER.—A reference to the directory would have given you the addresses of several wholesale dealers in photographic views. You are most likely to find what you want at Spooner's, in the Strand; Mansell's, in Oxford Street; or the Berlin Photographic Society, in Rathbone Place.

F. C. S.—Yes. Nitrogen has been solidified. The method adopted was to compress it, cool it in boiling oxygen, and allow it to expand a little. It then solidifies, and falls like snow in crystals. The temperature of boiling oxygen is 136° C.

B. P. L.—Hadleigh Castle is on the north bank of the Thames, at the back of the Chapman Lighthouse. It is opposite Cooling Castle, and with it formed the first line of defence on the Thames. It was built by Hubert de Burgh in the reign of Henry III. The nearest station is Benfleet, or perhaps Leigh. The ruins are extensive, and several storeys of the main towers are still standing.

CRANK AND CHAIN.—All such information can be obtained from the cycling newspapers. We can hardly fill our columns with information that would be useful only to so few. Among the dangerous hills for cyclists that we have heard of are Hunton and Westham, in Kent; Hedson, in Buckinghamshire; Birdlip, Charlton Kings, Stauway, and Broadway, in Gloucestershire; Cain's Hill, near Hambleton; and Horn's Hill, near Soberton; Bury and West Harting Hills, near Arundel; and Bonchurch, in the Isle of Wight. A list of all such hills can be obtained from the Cyclists' Touring Club, who are gradually putting up notice-boards on the roads leading to them.

JONAH.—It is officially stated that an ordinary copy of the "Times" recently counted up contained 311,450 words. The printed surface takes up about seven square yards. The three hundred thousand words are said to be about as many as the poems of Homer and Milton make when added together.

LITTLE TOY-MAKER.—The red is cochineal, but you can stain any wood with aniline dyes, such as Judson's.

E. POULDEN.—Use the Willesden paper just as if it were thin wood; instructions as to building in wood will apply to it, with the difference that you are dealing with much wider surfaces. See our articles on boat-building.

PRESTEIGN.—1. Boats only require a licence when they ply for hire. 2. It is one of the old sports, of which so many were in vogue on Shrove Tuesday. Much was made of them, owing to their being prohibited during Lent. 3. Hands anywhere. You must stop the fall with your head if you cannot do so with your body.

RAGGED ROBIN.—The "expectation of life" of a puppy dog is about ten years.

C. W.—1. America was first found in historic times by Eric the Red, but of course it must have been known to man before then, or man would not have been found there when the "discoverers" arrived. 2. Yes, there are still Indians in America, but they are decreasing in numbers. There is a district specially reserved for Indian habitation.

FIERY BEACON.—Vol. 1. costs six shillings, all the others cost seven shillings and sixpence. 2. Several excellent insect hunting grounds are in Surrey.

C. WILLIAM.—Transparencies are painted on stretched muslin which has been sized with gilder's size or gelatine. The size will slacken the muslin, and you must stretch it and size it again till you get it right.

LEX.—Bedford's "Guide to the Preliminary Examination," price three shillings, can be had from most law booksellers. It is published by Stevens.

AN OLD SUBSCRIBER.—"My Friend Smith" will probably be published in due course in the "Boy's Own Bookshelf," but it will not be issued for some time.

J. W. SCADDING.—If you coat the drawing with collodion it will not smear.

W. J. PRICE.—1. The "Encyclopædic Dictionary" is a very full one of the ordinary type; the dictionary of the Philological Society is a work that has taken years to organise, and will take years to finish. It is of a different stamp from the other, and its publication forms an epoch in our literature; but it is quite beyond your requirements. There are to be six volumes, each of six parts, and each part will cost twelve shillings and sixpence. 2. The address is London.

CHERRY RIPE.—1. There is an Arequipa in Peru, with a population of 35,000. There is a volcano and a department of the same name in the same country. 2. For the Highland clans see our article in the part for March, 1883.

INQUIRER.—The "Nautical Almanac" is published by Mr. John Murray, 50, Albemarle Street. It costs half-a-crown. It is always issued for the year in advance.

OLIVER.—1. The lower masts in clippers and steamers are now nearly always of iron or steel. 2. Of course, a yacht could be fitted with iron masts. Why not? They are lighter and stronger than wood. They are not solid, but tubular.

E. BRUNETTI.—The press of general correspondence prevents our answering without considerable delay. Your best course would be to advertise in one of the popular scientific papers, such as "Science Gossip," "Science Notes," "Science Monthly," etc.

SOUTH SEA ISLANDERS.—Scrape the cocoa-nut shells with glass, sandpaper them, and give them a coat of pale oak varnish.

T. G. C.—Two very different substances. Magnesite is carbonate of magnesia, colour white or greyish, with black markings; magnetite is protoxide of iron, colour black. Magnetite is the lodestone. The most powerful natural magnets come from masses in Siberia, Sweden, Elba, and the Harz. In New Zealand there is a magnetic iron sand.

JUNBO.—If you put the rose leaves into a glass bottle or jar, and fill it up with glycerine, the glycerine will extract the perfume, and give you something from which you can distil it.

HEADS OF OUR GREAT SCHOOLS.

(Continued from page 8.)

1. MR. JEX BLAKE, Rugby.
2. DR. STOKOE, King's College School.
3. DR. BAKER, Merchant Taylors.
4. MR. H. WESTON EVE, London University College School.

(To be continued.)

INCREDULOUS.—You mean the "electric salad"—with which, however, we are not practically acquainted. The directions were—"Immerse the mustard and cress seed in dilute oxymuriatic acid for two or three days, and then sow it in a very light soil; place over it a metallic cover, bring that in connection with an electric machine, and the plants will be ready for gathering in a few minutes." Why not try the experiment for yourself?

CONNECTING-ROD.—It is best to use a spirit-lamp for moveable models, and an air-burner for those that are stationary. Keep a string on your model during the trial-trip in case it should sink.

W. WILSON.—The ordinary graph mixture is one pound of gelatine, or one pound and a half of Scotch glue, soaked in water till it becomes flaccid, and then melted in a water-bath with six pounds of common glycerine, the heat being maintained for a few hours to drive off all excess of water. A water-bath is an ordinary gluepot, or any contrivance in which a jacket of water prevents the vessel containing your mixture from coming in direct contact with the fire. We have given several recipes in back numbers for graph composition. Here is one more. Twenty-six parts of water, fifteen of sulphate of barytes, six of gelatine, six of sugar, and thirty-six of glycerine. The ink is one part of aniline colours in seven parts of water and one of alcohol.

G. A. W.—Our competitions are open to every boy reader throughout the world.

WESTIMENTUM.—1. Read "The Cricket Bat, and how to make it," in our fifth volume. 2. See the Cricket articles in the third volume. 3. Consult the advertisements on wrapper.

I. S. S.—To clean a small flue you might try burning a piece of zinc on the fire. The fumes will completely clear away the soot.

W. D. A.—There is no necessity to give yourself so much trouble in chipping out the glass. Give the putty a thick coat of soft-soap and leave it on for a day. It will soften so that you can easily cut it with your knife.

A. B.—1. Yes, there are forgeries of coins, but any one can copy a crest. 2. Buy one of our monthly parts and consult the advertisements on the wrapper. 3. The arms are borne on the shield; the crest comes over them.

FINEM.—You will find most of the information you want as to places of interest round London in the threepenny Saturday Half-Holiday Guide, published by Bemrose, of the Old Bailey. Ward and Lock and other publishers have "Greater London" guide-books, which would help you. An excellent map of the district was given away by Messrs. Cassell and Co. in their "Greater London."

THE SPIDER AND COPYING INK.—You will find a good "graph" mixture in No. 188, in September part for 1882; and in No. 205, in January part for 1883. Why not buy an index?

S. Y. L.—1. To whiten your skeleton and clean away the fatty emanations and disagreeable odour, rest the bones upon strips of zinc placed about an inch above the bottom of a glass jar, and fill it up with spirits of turpentine. The turpentine acts as an oxidising agent, and the product of the combustion is an acid liquor, which sinks to the bottom. 2. The "Boy's Own Museum" began in No. 91, and finished in No. 103.

A. BOVEY.—You will find technical treatises upon canals in the price-lists of either Lockwood and Co., of Stationers' Hall Court, or Spon, of Charing Cross.

F. BAINBORROW.—The articles on "Signals at Sea" was in the November part for 1882.

G. A. R.—1. Wash the oilcloth clean with lukewarm water, using a large soft woollen cloth, dry it thoroughly with another soft cloth, and then polish it with milk, or a weak solution of beeswax and turpentine. Never use hot water, or soap, or a hard rag, or brush, or anything that will rub the paint off the pattern. 2. Paint on woodwork is best cleaned by a solution of a half-ounce of glue and a bit of soft soap as big as a walnut in three pints of warm water. Use a whitewash brush, and rinse with cold water and a wash-leather.

Our Portrait Gallery.

(Continued from page 8.)

THE portraits of the Heads of our Great Schools given in this week's number were engraved from photographs, as follows:—Mr. Jex Blake, of Rugby, from a photograph by Mr. C. Whetton, High Street, Rugby; Rev. Dr. Stoke, of King's College School, from a photograph by Messrs. Elliott and Fry, Baker Street, London; Dr. Baker, of Merchant Taylors, from a photograph by the Stereoscopic Company, Cheapside, London; and Mr. Eve, of University College School, from a photograph by Mr. Barraud, of Oxford Street, London, W.

SCHOOL AND THE WORLD:
A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER IV.

"Why have you been so long coming?"

SOADY was in a quandary. To a boy of such a communicative turn of mind it was absolute penance to have to be silent, and now he had a secret hidden in his breast which he was bursting to reveal.

"I'll see Lang," he said to himself, "and find out if he did go to the Rum-

mage-room. But there! I know he did, so what's the good of asking? Why didn't he tell the Doctor? I know he didn't take anything."

At this moment Tommy appeared. Tommy was Soady's great friend, a youngster of the lower school who had

been put in Soady's charge by his parents, who knew something of him at home. Soady made Tommy his confidant and chum, and a queer pair they were. Tommy's surname was Scott, but as Soady always called him by his Christian name, the school followed suit.

It was a sore trial to Soady to think that here was Tommy, and yet he must not breathe a word to him.

"I'll walk away," thought Soady. "Perhaps he hasn't seen me; he'll think it rum if I don't stop if I see him, and if I do I shall tell him all about it, as safe as a gun."

So Soady turned away and walked in the opposite direction. But Tommy was not to be done.

"Hi! Soady!" he yelled.

But Soady was deaf to the voice of the charmer.

"Stop, you!" Tommy shouted; "I want you!"

"Catch me, Tommy!" shouted back Soady, who could not pretend to be deaf any longer. He ran off at a good pace, leaving Tommy panting in the rear.

"Stop!" he shouted, but in vain. Tommy was not cut out by nature for progress, so in a minute or so he subsided, Soady being far out of reach.

"What an ass he is!" soliloquised Tommy. "Won't I get into a shine, too! Here's Pickering sent me out to tell Soady the Doctor wants to see him, and I can't get near him! What possessed him to run away like that!"

When he had recovered his wind, off went Tommy again, soon catching sight of his quarry.

"Soady, Doctor wants you!" he shouted, as soon as he was within hearing.

"Can't hear!" returned Soady.

"Wait for me, then!"

"Can't! got an appointment with the dentist."

"Doctor wants you!" pumped out Tommy.

"Oh yes, Tommy! Don't you think you're going to catch me with that chaff! Good-bye!"

Off went Soady again, leaving Tommy the picture of disgust and despair.

"The Doctor can catch him himself if he wants him," he said, angrily. "What he wants to lead me a dance all over the field for this kind of day I don't know; he's generally down under a tree."

"What a persevering young beggar it is!" thought Soady, when he had placed

a good distance between himself and his pursuer; "that's the worst of chumming up with the little 'uns, they never leave you alone."

"Soady!" cried a voice in the distance, then another took up the cry.

"They seem to want me more than usual," thought Soady. "What's the row?" he shouted back.

"Doctor wants you!" was the reply.

For a moment Soady thought that this too was a hoax, but as he recognised Garland as one of the shouters the truth flashed across his mind. What a dolt he had made of himself! Tommy must have been sent out to fetch him.

He made very good time across the field, and reached the house panting. He had not recovered his breath by the time he reached the Doctor.

Mr. Pickering was there too. It struck Soady suddenly why he was wanted.

"Soady," said the Doctor, "why have you been so long coming? I sent for you nearly ten minutes ago."

"I was at the back of the field, sir, all alone."

The point was not pressed; fortunately for him, more important matters took its place.

"Mr. Pickering has just told me that you were in the music-room this afternoon during drill, and that you saw Lang come out of the Rummage-room."

"Yes, sir."

"You heard me ask this afternoon if any of you had been in there?"

"Yes, sir."

"Why did you not tell me then?"

"I hadn't been there, sir; and I thought that if Lang had, it was for him to say so."

It was a straightforward answer, and the Doctor made no attempt to argue the point.

"Did you see him go in and come out?" he asked.

Soady was glad he could answer this question with a clear conscience. Anything he might say now would serve to clear Lang, instead of implicate him.

"Yes, sir; he left the door wide open; he wasn't in there half a minute. He took a ball out of the long box and came out again straight, whistling."

Soady thought the last detail ought to tell, and so it did.

"You saw him the whole time?"

"Yes, sir, I was standing at the window."

As he said it he perceived he had let himself in for a reproof for wasting his time when he was supposed to be practising, but the opening was not taken advantage of by the Doctor.

"You can go," said the Doctor. "Lang does not know you saw him?"

"No, sir."

"Tell him to come to me, and don't mention the reason I want to see him."

Soady hesitated at the door, and then turned round.

"Please, sir, would you much mind if some one else told Lang you wanted him? He doesn't know I saw him, and I'd a great deal sooner he didn't if you don't mind."

The Doctor looked surprised.

"Very well; perhaps it might cause unpleasantness between you. I suppose you boys have the old ideas about sneaking. I will send some one else for Lang, and not mention you at all."

Soady was thankful, for he liked Lang, and was greatly afraid that if it got to his ears that he had told the Doctor of his visit to the Rummage-room it would cause a quarrel between them, however much he might protest his innocence.

"Jolly row he'll get into," thought Soady. "I'm glad I'm not in his shoes. It's the best way, after all, to speak out when there are awkward questions flying about; it saves trouble in the end."

Soady's motives were not very high ones, to judge from his talk, but they were higher than perhaps even he imagined. At all events, he was never known to tell a lie or do a mean trick, and traits such as these are very good indications of a sound character.

Next to his regret for the trouble Lang was in was his sorrow that for the present he must avoid Tommy. He must let at least a night go by before he could safely meet his young chum without letting out his secret.

(To be continued.)

OUR CRICKETING GUESTS.

(See the Coloured Plate.)

THE Australian visit of 1884 was in one sense the most successful we have yet been favoured with. Thanks to the glorious summer weather which gave us the best season since 1876, the matches aroused considerably more interest among the general public. They were almost invariably played on more heavily crowded grounds than in previous years, and owing to the long scoring frequently extended into the third day. In a purely cricketing sense, however, the success was not so great, for, although eighteen matches won and seven lost out of thirty-two is a very fair record, it does not come up to the level of any of the former travelling teams either to or from Australia. In 1882 thirty-eight matches were played and only four were lost, in 1880 thirty-seven matches were played and only four lost, and in 1878 only seven matches were lost out of forty-seven, as against the seven out of thirty-two of the current year. Figures, however, do not prove everything. In cricket relative calibre should never be overlooked. The 1878 matches were in most cases against teams greatly inferior in reputa-

tion to those against which the colonists had this year to contend, and although such matches as those against Liverpool and Leicestershire preclude the tour from being looked upon as exclusively first-class, yet its record is really better than that of 1878. All the same, it is by the statistics that the team will in future be judged, and these show unmistakably, all that has been said to the contrary notwithstanding, that the Austra-

lians of 1884 had gone off their 1880 and 1882 form, and did not reach the level of our champion county.

The relative merit of the English and Australian players can be seen at a glance by the tables of averages that follow side by side. One gives the batting averages of the Australians, the other that of the thirteen Englishmen who most frequently played against them.

AUSTRALIA.

Peate	13	74	19	6	10.4

* Signifies not out.

And from these it appears that whereas the highest Australian average was 30 and the lowest 5, the highest English average was 42 and the lowest 10; and whereas the general average of the Australians comes out at 17, that of the Englishmen amounts to 25! Thus far as regards batting only; in bowling, however, the result is still more unexpected. Compare the averages of the eight Australian bowlers with that of the men who oftenest bowled against them.

Here again the best English average is a long way better than the Australian, and the worst Australian is a long way worse than the English; while the general average of the Australians works out at 29, whereas that of the Englishmen is below 19!

Murdoch holds premier position amongst the batsmen, his average being only just a trifle under what it was in 1882. His chief effort was his great innings against England at the Oval, when he totalled 211—the same number of runs as Spofforth took wickets during the tour—and which proved his greatest score in England, except his 286 against Sussex in 1882. The English-born McDonnell comes next with 1,225 runs for 23, a great advance from the 17 of 1882, and the only advance in the team. The third place is held by Scott, who was new to English cricket; Giffen, the best all-round man in the team, coming fourth with 1,052 runs for 21, while all below him secure less than 20. In bowling Spofforth for the first time heads the averages, although his record 12.76 is the worst he has obtained in England. Palmer has 16 as against 11 in 1880 and 12 in 1882; Boyle has also 16 as against 10 in 1878, 7 in 1880, and 11 in 1882; Giffen has 19, and all below him exceed the 20. Before we dismiss the individual performances we may note that five scores over a hundred were made for the visitors—two by Murdoch, the 211 already noted and 132 against Cambridge University, and one each by Giffen, McDonnell, and Scott, for 113, 103, and 102, against Lancashire, England, and England respectively. Here, again, however, the luck went against them, for to their five the Englishmen scored twelve—three being made by Dr. W. G. Grace, one for 116 not out for Gloucestershire, one for 107 for the Gentlemen, and one for 101 for M.C.C. and Ground; two by Mr. A. G. Steel, one of 148 for England and one for 134 for M.C.C. and Ground; and one each by Barlow for the North, by Barnes for M.C.C. and Ground, by Mr. Brain for Gloucestershire, by Phillips for Sussex, by Mr. Read for England, by Scotton at Huddersfield, and by Mr. Wyatt for Sussex. Of ciphers of another sort, the Australians are credited with sixty-nine duck's eggs—Spofforth claiming eleven of them—and amongst them were three pairs of spectacles, one each for Bonnor, Boyle, and Blackham. The bowling drawbacks were also unusually high, the no-balls amounting to twenty-seven—Spofforth claiming fourteen of them—and the wides amounting to thirteen.

Of the eleven representative matches, five were won—the two against the Players, the

two against the South, and one against the Gentlemen; two against England were drawn; and four—one against England, one against the Gentlemen, and two against the as yet undefeated North—were lost. Of the twenty-one other matches, thirteen were won, five were drawn—only one, however, in favour of the Colonists—and three—those against M.C.C. and Ground, Kent, and Oxford University—were lost. The scores in each case are given in full in the following table of the

RESULTS OF MATCHES.

Matches played, 32; won, 18; lost, 7; drawn, 7.

May 12 and 13, at Sheffield Park, Sussex, v. Lord Sheffield's Eleven.—The Australians, 212. Lord Sheffield's Eleven, first innings, 86; second innings, 120. The Australians won by an innings and six runs.

May 15, 16, and 17, at Oxford, v. Oxford University.—The Australians, first innings, 145; second innings, 168. Oxford University, first innings, 209; second innings, 110 for three wickets. Oxford University won by seven wickets.

May 19 and 20, at Kennington Oval, v. Surrey.—The Australians, first innings, 195; second innings, 48 for two wickets. Surrey, first innings, 97; second innings, 144. The Australians won by eight wickets.

May 22 and 23, at Lord's, v. M.C.C. and Ground.—The Australians, first innings, 184; second innings, 182. M.C.C. and Ground, 481. The M.C.C. and Ground won by an innings and 115 runs.

May 26, at Birmingham, v. an England Eleven.—The Australians, first innings, 76; second innings, 33 for six wickets. The England Eleven, first innings, 82; second innings, 26. The Australians won by four wickets.

May 29, 30, and 31, at Lord's, v. the Gentlemen of England.—The Australians, first innings, 135; second innings, 269. Gentlemen of England, first innings, 277; second innings, 129 for six wickets. Gentlemen of England won by four wickets.

June 2 and 3, at Derby, v. Derbyshire.—The Australians, 273. Derbyshire, first innings, 106; second innings, 127. The Australians won by an innings and 40 runs.

June 5, 6, and 7, at Manchester, v. Lancashire.—The Australians, first innings, 174; second innings, 315. Lancashire, first innings, 195; drawn owing to rain.

June 9 and 10, at Bradford, v. Yorkshire.—The Australians, first innings, 60; second innings, 68 for seven wickets. Yorkshire, first innings, 55; second innings, 72. The Australians won by three wickets.

June 12, 13, and 14, at Nottingham, v. Nottinghamshire.—The Australians, first innings, 131; second innings, 179 for seven wickets. Nottinghamshire, first innings, 170; second innings, 183. The Australians won by three wickets.

June 16, 17, and 18, at Cambridge, v. Cambridge University.—The Australians, 378. Cambridge University, first innings, 204; second innings, 93. The Australians won by an innings and 81 runs.

June 19 and 20, at Manchester, v. the North of England.—The Australians, first innings, 91; second innings, 107. The North of England, 220. The North of England won by an innings and 22 runs.

June 23 and 24, at Liverpool, v. Liverpool and District.—The Australians, first innings, 140; second innings, 198 for nine wickets. Liverpool and District, first innings, 213; second innings, 54. The Australians won by one wicket.

June 26, 27, and 28, at Kennington Oval, v. the Gentlemen of England.—The Australians, first innings, 229; second innings, 219. The Gentlemen of England, first innings, 261; second innings, 141. The Australians won by 46 runs.

June 30, July 1 and 2, at Sheffield, v. the Players of England.—The Australians, first innings, 189; second innings, 178 for four wickets. The Players of England, first innings, 230; second innings, 134. The Australians won by six wickets.

July 3, 4, and 5, at Huddersfield, v. an England Eleven.—The Australians, first innings, 175; second innings, 124 for seven wickets. The England Eleven, 453. Drawn, owing to rain.

July 10, 11, and 12, at Manchester, v. England.—Australia, first innings, 182. England, first innings, 95; second innings, 180 for nine wickets. Drawn.

July 14 and 15, at Leicester, v. Leicestershire.—The Australians, first innings, 175; second innings, 33 for no wicket. Leicestershire, first innings, 143; second innings, 64. The Australians won by ten wickets.

July 17 and 18, at Lord's, v. Middlesex.—The Australians, 188. Middlesex, first innings, 53; second innings, 106. The Australians won by an innings and 29 runs.

July 21, 22, and 23, at Lord's, v. England.—Australia, first innings, 229; second innings, 145. England, 379. England won by an innings and five runs.

July 24, 25, and 26, at Brighton, v. Sussex.—The Australians, first innings, 309; second innings, 144. Sussex, first innings, 396; second innings, 25 for four wickets. Drawn.

July 31 and August 1, at Kennington Oval, v. the Players of England.—The Australians, first innings, 151; second innings, 28 for one wicket. The Players of England, first innings, 107; second innings, 71. The Australians won by nine wickets.

August 4, 5, and 6, at Canterbury, v. Kent.—The Australians, first innings, 177; second innings, 109. Kent, first innings, 169; second innings, 213. Kent won by 96 runs.

August 7, 8, and 9, at Clifton, v. Gloucestershire.—The Australians, 314. Gloucestershire, first innings, 301; second innings, 230 for two wickets. Drawn.

August 11, 12, and 13, at Kennington Oval, v. England.—Australia, 551. England, first innings, 346; second innings, 85 for two wickets. Drawn.

August 18, 19, and 20, at Cheltenham, v. Gloucestershire.—The Australians, 402. Gloucestershire, first innings, 183; second innings, 83. The Australians won by an innings and 136 runs.

August 21, 22, and 23, at Nottingham, v. Nottinghamshire.—The Australians, first innings, 265; second innings, 141. Nottinghamshire, first innings, 273; second innings, 15 for one wicket. Drawn.

August 25, 26, and 27, at Brighton, v. Cambridge University Past and Present.—The Australians, first innings, 190; second innings, 180. Cambridge University Past and Present, first innings, 135; second innings, 93. The Australians won by 142 runs.

August 28 and 29, at Gravesend, v. the South of England.—The Australians, 358. The South of England, first innings, 178; second innings, 73. The Australians won by an innings and 107 runs.

September 1, 2, and 3, at Nottingham, v. the North of England.—The Australians, first innings, 100; second innings, 76. The North of England, first innings, 91; second innings, 255. The North of England won by 170 runs.

September 4, 5, and 6, at Scarborough, v. I Zingari.—The Australians, first innings, 233; second innings, 139 for two wickets. I Zingari, first innings, 229; second innings, 149. Australians won by eight wickets.

September 10 and 11, at Kennington Oval, v. South of England.—The Australians, 163. South of England, first innings, 56; second innings, 102. The Australians won by an innings and five runs.

OUR HOME FORCES.

BY ROBERT RICHARDSON, B.A.

WHAT ho! our own home forces—

Just seven soldiers strong,
With Harry Holt their captain,
And Frank his aide-de-camp.
They thunder forth their orders
With such a martial air,
The miller at his doorway
Looks up to smile and stare.

Philip's their standard-bearer,
The drummer-boy is Jack;
At flourishing the drum-sticks
He has the prettiest knack.
There never was a drummer,
Since first the art began,
Could beat like Johnny Armstrong
So brave a rataplan.

Heads up, eyes front, and forward,
Along the sunny street;
The smooth old stones re-echo
The tramping of their feet.
With what a patriot ardour
Each loyal bosom glows;
They're ready at this moment
To meet their country's foes.

They're sorry that they live in
Such piping times of peace,
When nought more warlike meets them
Than old Dame Dawson's geese.
Oh! blithe and merry England
Is safe for evermore,
While she has trusty soldiers
Like these to guard her shore!

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

*Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.*CHAPTER II.—TO THE DIAMOND FIELDS (*continued*).

THE days went by and the miles were slowly rolled off. Sometimes the horses would cover the ground in fine style, at others it seemed impossible to move them. Little by little the journey was completed, and one fine day the coach reached Hopetown. Another stage and Kimberley was passed. Then a few wooden huts appeared on the horizon.

It was New Rush.

There the diggers' camp differed but little from the temporary towns which spring from the ground as if by enchantment in all new countries—wooden huts of no great size and roughly built, a few tents, a dozen coffee bars or canteens, an alhambra or dancing saloon, several

tables and patent medicines, wheel ploughs and toilet soaps, hair combs and condensed milk, frying-pans and cheap lithographs—everything, in short, but buyers.

For the whole population of the camp was now at work at the mine, which is about a quarter of a mile from New Rush.

Cyprien, like the other fresh arrivals, hastened off thither, while dinner was being got ready at the Continental Hotel.

It was about six o'clock in the afternoon. Already the sun had begun to veil the horizon in a thin cloud of gold. Once again the engineer noticed the enormous apparent diameter assumed by

for Cyprien awaited him at the Kopje, that is to say, at the diamond diggings.

Before the opening of the works the site of the mine was an elliptical knoll, the only elevation in a plain as level as the sea. But now an immense gap with sloping sides, a sort of circus, oval in form and about forty yards across, had taken the place of the hill. The surface was cut up into three or four hundred "claims" or concessions, each thirty-one feet long.

The ground, consisting chiefly of reddish sand and gravel, was being excavated by pickaxe and spade and sent to the surface. Thence it was taken to the sorting tables to be washed, crushed, sifted, and finally examined with extreme care to see if it contained any of the precious stones.

The claims, having been excavated independently of each other, formed ditches of varying depths. Some went down for a hundred yards or more, others for thirty, twenty, or even fifteen. To give room for working and intercommunication, each holder is officially required to leave untouched on one of the sides of his claim a space of seven feet. This space, with that left by his neighbour, serves as a sort of gangway or embankment flush with the original level of the ground. On it joists are placed so as to overhang the claims for about a yard on each side, and by this means sufficient width is obtained to allow a couple of carts to pass abreast.

Unfortunately for the solidity of this hanging way and the safety of the miners, the holders of the claims gradually work in as the wall goes down, and as in some cases the depth is two or three hundred feet, the result is that the partition becomes a reversed pyramid standing on its apex. The consequences can be guessed. The walls fall in, particularly during the rainy season, when owing to the abrupt changes of temperature the surface is seamed with cracks and the sides split off along them. Nevertheless the periodic recurrence of these disasters has no effect on the miners, and they persist in excavating their claims up to the very farthest limit of the dividing line.

As Cyprien approached the mine he could see nothing but the carts moving about on the hanging roads, but when he had got near enough to peer into the depths of the curious quarry he beheld a busy crowd of diggers of every nation, every colour, and every costume at work in the claims. Negroes and whites, Europeans and Africans, Mongols and Celts—most of them in a state of semi-nudity, or wearing cotton drawers, flannel shirts, and straw hats decked in many instances with ostrich plumes.

All were engaged in transferring the soil into leather buckets and sending them to the bank along wire ropes by means of cowskin halliards working over drums of open woodwork. There the buckets were emptied into the carts and

New Rush.

"stores," and the usual johnny-all-sorts shops.

In the shops were clothes and furniture, boots and glasses, books and saddles, weapons and drapery, brushes and brooms, blankets and cigars, green vege-

the sun as well as the moon in these latitudes, a phenomenon of which no sufficient explanation has yet been advanced—the said diameter being about double as large as in Europe.

But a spectacle of much greater novelty

then sent down to the bottom of the claim to be returned with a fresh load.

These long iron ropes stretched diagonally across the rectangular chasms give a peculiar look to all dry diggings or diamond mines, and resemble the threads of a gigantic spider's web whose weaving has been suddenly interrupted.

For some time Cyprien amused himself with contemplating this human ant-hill. Then he returned to New Rush, where the dinner-bell rang almost immediately after his arrival. There during the evening he had the pleasure of hearing of the wonderful finds that had been made, of miners poor as Job suddenly becoming rich men by finding a solitary diamond, of others ever down on their luck, of the greed of the brokers, of the dishonesty of the Kafirs employed in the mines who stole the best stones, and of many other technical matters. The talk was of nothing but diamonds, carats, and hundreds of pounds.

Every one seemed the picture of misery, and instead of the happy digger noisily calling for his champagne to wet his luck, there were a dozen lanky long-faced fellows drinking nothing but small beer.

Occasionally a stone would be passed round the table to be weighed, examined, valued, and returned to its owner's belt. That dull greyish pebble, with no more sparkle than a fragment of quartz rolled in a torrent, was a diamond in its gangue!

At night the coffee bars filled, and the same conversation, the same discussion which had occupied the dinner-hour, began again.

Cyprien went to bed early in the tent next to the hotel which had been assigned to him. There he soon fell asleep, despite the noise of a ball in the open air among the Kaffir diggers close by, and the piercing brays of a B-flat cornet from a neighbouring dancing saloon in which the whites were amusing themselves with a few energetic lessons in choreography.

Transferring the soil into leather buckets.

THE "BOY'S OWN" MODEL LAUNCH ENGINE.

BY H. F. HOBDEN.

that appeared in the last volume. As one who has had considerable experience in such matters, I am sure they could not spend their spare time in a more profitable manner, alike as regards the value of the engine when made, and the amount of practical information they can pick up whilst employed in its construction—information that will always be useful to them in after life.

Now that the long evenings are setting in, and knowing too that there are a large number of boys who like to make the best they can of anything they take in hand, I propose in this article to give a few practical hints showing how to build a perfect model of an inverted-cylinder direct-action engine with link-motion reversing gear, like the sketch at the beginning of this paper, which represents a type in daily use on the river and sea.

Such a model, having a fixed cylinder, has not the friction of other types, and therefore it gives more power, size for size, than an oscillating engine, and does not get so easily out of order.

I will give, too, instructions as to rigging up the pumps, so that the engine can be conveniently worked for any length of time required; and will supplement this with a sketch of an injector for filling the boiler, an arrangement that saves a great deal of friction in the engine.

doubt many admirers of the ever-popular BOY'S OWN PAPER have commenced ere now building a marine engine for themselves, or have had serious thoughts of doing so, since reading the interesting illustrated articles on the subject by Mr. Chasemore

And now to my pleasant task.

You must of course have a lathe, which I will therefore suppose you to possess; but should there not be a slide-rest to it you must get the cylinder bored by a professional turner, for which he will charge about two shillings, according to the size of your castings.

Let me first briefly explain the action of the steam in the engine by a diagram (Fig. 1).

The cylinder A is bolted into the standard, B; the ports or steam-passages are shown at C; and the slide-valve that allows the steam to pass alternately to each side of the piston is marked D, in its case E. G G are the stuffing-boxes, which have to be packed with lamp-cotton greased to make them steam-tight. H is the piston, with its rod finishing in a crosshead J, which is cut with a groove to slide up and down the standards to guide it and prevent the piston-rod being bent out of shape. K shows the connecting-rod, attached at its lower end to the crank L. M is one of the eccentrics working the slide-valve. N is the main shaft, resting on the plunger blocks O O, having a heavy fly-wheel at P and the coupler at Q. R is the top cylinder plate, drilled to screw in the grease-cock, of which I will presently give a drawing on an enlarged scale. S is the bed-plate, T the steam-supply, and X the exhaust.

You will observe that the steam is coming in at the top of the cylinder, through the top port, as shown by the arrow, pressing the piston down and allowing the waste steam that has already raised the piston to escape through the lower port, and so into the exhaust. By that time the slide-valve is raised (by the eccentric) sufficiently to cut the steam off from the top port, which by that means is in its turn put in communication with the exhaust, and allows the steam to pass out of the top part of the cylinder, whilst it admits it to the lower portion, and so on alternately.

And now to the practical work. After having the cylinder bored, as already mentioned, get a piece of oak or other hard wood

1½ in. square and about 6 inches long. Turn one end of it in the lathe, so that it fits the inside of cylinder, and drive it on. Then put it in the lathe again, and turn the

flanges A (Fig. 2) down, and be very careful that they are quite true and square.

The top and bottom cylinder-covers, with the stuffing-box, come next. Screw a piece of hard wood on the end of your lathe mandrel, turn it down to about a quarter of an inch less in diameter than the flanges of your cylinder, make a small hole for the stuffing-box to be driven in, as in Fig. 3. You can

now turn the edge and side—that next the cylinder. The projecting part A is to be the exact size of the diameter of cylinder. When this is done, take it out and place it in another chuck, and drill and turn the stuffing-box out, and screw it to receive the gland (Fig. 4).

Now chuck the top cover and turn it down to size. The piston is a casting, and has to be turned in the lathe to fit the cylinder, and a groove run round it to hold the greased cotton to make it steam-tight. Whilst in the lathe drill a hole in the centre, and tap it to receive the piston-rod, which you can make out of steel wire. Then pass one end through the stuffing-box on cylinder-cover and screw it on the crosshead J (Fig. 1), having first filed it up quite square and true and finished it off with emery. Now take the standards B (Fig. 1), and finish them up with a file in the same way, and be careful that the insides forming the guides for crossheads are quite true. We can now make the lagging for cylinder. Get a piece of mahogany the length of the outside circumference of cylinder and the width of the distance between flanges of same. Then plane it down to about an eighth of an inch and score it with a penknife every eighth of an inch down its width; it will then bend round the cylinder, and you can fasten it on by a couple of brass bands, screwing the ends down near the slide-valve case.

We will next tackle the steam-ports in the cylinder BB (Fig. 2). They are simply two holes drilled side by side until they reach the openings CC (Fig. 2) in the casting; they must not be drilled any farther.

Now place the ends on cylinder and drill through them so as to screw them on to the flanges. The slide-valve case is a casting with separate lid (Fig. 5), and has to be faced up.

FIG 5

with a file, and four holes drilled through the lid and corners to screw on to the cylinder face. The boss on lid must now be drilled and tapped for steam-pipe to be screwed in.

The slide-valve itself is like Fig. 6, has a

FIG 6

hollow cast in its face, and a small projection on the back (B), which you must make a narrow groove in with a saw, and file the end of the valve-rod down to fit it, as shown at C, Fig. 6.

The face of the cylinder and also of the slide-valve must now be made to work steam-tight by rubbing on a perfectly flat stone until true, and then putting some emery and oil on a board and working them up until they are quite true.

(To be continued.)

ONE OF MOTHER CAREY'S CHICKENS.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "A Dunces Disasters," "The White Rat," etc.

CHAPTER III.

"WELL, now, if that ain't enough to drive one mad!" exclaimed Mother Carey as her husband came in to his dinner the day after the Dumpling's last visit to the old willow-tree.

"There's the rascally old hen been a-cackling again, John. She's a-cackled four days running, and where she's hidden the eggs I don't know."

"Very strange, to be sure, missus," said John as he took his seat at the table.

"I've seen her with the rest, as innocent as a babe, a score of times, and how she continues to bamboozle us I can't say."

"It's a myth and a tragical story, John, and I can't make out the pros and poffs of it," rejoined his wife, who was rather proud of her power of language.

John now turned his attention to dinner, and when it was over he lit his pipe and sat down in the chimney corner to ponder on the vagaries of poultry in

general, and the impertinence of this Cochon China hen in particular. His meditations were broken by a rat-tat-tat at the door.

The Dumpling rolled in.

"I say, Mother Carey, could you lend me a dish? Do. I'll take care not to break it. Oh, I say! what a nice smell of dinner! Wish you had invited me. 'Xpect you had something better than everlasting beef and stickjaw. Hulloo!

John, I'll bring you back some baccy next term; better than that old cabbage stuff you're smoking there."

"Thank you, sir. Mother, lend Master Bertram a dish."

The Dumpling looked round the kitchen, and espied a large yellow earthenware basin.

"That's the very thing, mother. I'll take great care of it."

"Well, sir, mind you bring it back."

"All right; thanks."

The Dumpling went off with it. As soon as he was outside the cottage-door he put the dish on his head and his cap on the top, and made for the wood-yard, whistling as he went, his trusty club "dealing destruction's devastating doom" along the path wherever anything capable of receiving damage presented itself within range.

And so we find him, as we left him at the close of the last chapter, with jacket off, succinct and expedite for the important task before him.

He worked away with zeal, and his eyes sparkled as he mixed the brandy and beer with the yolks of the eggs, and flogged up the whites with a wisp of an old broom. He was tempted to taste the mixture—but no; by a powerful effort he restrained his appetite, for he wished to inform his boon companions that he hadn't had one mouthful unfairly, thereby to raise himself still further in their estimation.

The dainty dish was at last finished to his satisfaction, and certainly presented a pleasing appearance. The strawberry-jam, with the rich sauce, looked rapturously inviting under the snowy mountain which towered so majestically above it.

The Dumpling eyed his masterpiece with a soft approving smile, and turned his head sideways right and left to contemplate the dish in all its aspects, and there was a sense of unqualified complaisance in his heart.

The bell for changing boots at length broke harshly on his ear, and reluctantly consigning the trifle to the recesses of the old tea-chest, he rolled down his sleeves, put on his jacket, and joggled off to the house.

It was not to be expected that much work was to be got out of him that afternoon. His intellect was absorbed in one line of thought, and no allurements of Euclid or Colenso could avail to draw it in another direction. The circles in the figures looked liked dishes, and he sighed for the hours to fly.

Though time waits for no man, its moments often linger unpleasantly for boys, and it seemed an age to the Dumpling before the opportunity arrived for displaying the triumph of his skill to his admiring clients. However, the hands of the clock did at last point to half-past six. Tea was finished. Each member of the secret society had purloined a mug and spoon in accordance with the directions of the president; and each, at wide intervals apart, like the Plateans in their sortie during the famous siege, prepared to wend his way to the trysting-place appointed for the orgies.

It was a clear frosty evening. A full moon rode triumphant in the sky. The Jolly Guzzlers had to be careful in picking their way under shadows of walls and trees, for boys were not supposed to be out after tea, and many windows overlooked the ways to the wood-yard.

Buffles was first to arrive, having performed his journey without danger.

Stodge had started next, but was delayed on the road, for at the outset, while scurrying across a moonlit space, he had heard a window open and a voice which no boy could mistake had called out, "Hullo! who's that?"

Stodge decided that such a question was not worth answering, and had dived into the shadows of a laurel clump, where he crouched for a while before making a dash across some more open ground.

The voice was indeed that of Doctor Porchester, who had been talking to old Carey about putting some hay-ropes round some exposed water-pipes to prevent them bursting by the frost. The Doctor had gone to the window of his study to make meteorological observations as to the probability of severe cold that night, and his eagle eye had espied the form of a boy flitting past.

And so the window had been opened, and the words uttered in a severe tone.

Not receiving any answer, and being aware that the suspicious form had vanished into darkness, the Doctor had said to his trusty servant, "John, just go and see who that was, and what mischief he's up to, and don't forget the pipe that supplies the fountain."

Now, old Carey was good at woodcraft, and knew well enough how to stalk a boy. He had already made his own private observations, being naturally of an inquisitive nature, and anxious in this instance to ascertain the object for which his yellow dish had been borrowed. He had taken a sly peep out of his cottage window, and watched the Dumpling enter the wood-yard, and when he went to fetch the boots that afternoon he visited the yard and just "prospected" a bit, and it did not need much ingenuity to discover the dish. Old Carey opened his eyes, and said, "Who'd a' thought it?" and indulged a long, low, chuckling laugh as he surveyed the confection, for truly it presented a most enticing aspect, and he could not but admire the culinary skill displayed.

Therefore, when the Doctor bade him go forth upon his errand, old Carey put two and two together, and, having discovered that they made four, he laid his plans accordingly. Proceeding by a route apparently contrary to all rules of warfare, being distinctly in an opposite direction to that of the enemy, John Carey went down the playground and into the field. He even walked to the extreme end, turned half-left, and skirted the wall, which manœuvre brought him under the massive shadow of some ancient ilex-trees. Turning half-left once more, he swiftly stepped out the distance intervening between himself and the vicinity of the wood-yard.

By this masterly stratagem he reached a long red-tiled and ancient stable flanking the yard. Noiselessly opening a door at the farther end, he entered, and passing along, he posted himself opposite a window looking into the yard, a pane of which was broken. Kneeling down at that spot he could not only see all that went on in the wood-yard, but also hear every word that might be spoken by any persons present therein, being himself meanwhile in safe concealment. To him, then, I am indebted for the information contained in the remainder of this chapter.

He saw Buffles and Stodge seated on two stumps of trees, holding converse together.

"I say, Buffles, I had a terrible shave of being caught. Old Poco saw me from his study window and halloed out, 'Who's that?' I was in an awful funk, and dodged behind the laurels. He couldn't have seen who I was."

"What an ass you were to go that way!"

"Well, Dumpling told us to go different ways, and none of you fellows would dare to go through the garden. I'm not half such an ass as you."

"Yes you are. Dumpling says you're the greatest ass in the school. Hark! here comes some one."

The door of the wood-yard was cautiously opened, and in stole Grubbins. Guzzling Jam soon followed.

"Hullo, you fellows; it's all right. The President will be here in a jiff. I saw him start. He's coming down the playground."

A minute more and the President's heavy tread was heard outside.

The four subordinates rose to receive him, each with mug and spoon in hand.

Now nothing could have been easier than for the Dumpling to open the door and come in like the other boys had done. But his waggish nature prompted a more difficult method. I remember, at a circus, seeing a clown take up one of those paper hoops through which a fairy equestrian had just bounded. The clown held it out and jumped into it; and in order again to extricate himself he went through a series of the most difficult and ludicrous movements, twisting himself into inconceivable attitudes; whereas, had he been so minded, he might have stepped out as easily as he stepped in.

Some such clownish intention evidently filled the Dumpling's mind. For with prodigious exertion he climbed to the top of the black boarding that formed the barrier of the wood-yard, and reared his gigantic form into prominent view. There he sat grinning.

"Hullo, you chaps; you're all here, I see. Now let me show you an acrobatic performance, just to whet your appetites."

There was an old tree leaning against the fence, amid a heap of faggots, a broken-down wheelbarrow, a wooden tub for catching rain-water, and a nondescript accumulation of lumber.

The Dumpling, after some difficulty, elevated himself on a fork of this tree. Standing on one leg he kicked out the other and set the whole fence vibrating and cracking as he executed a wild untutored ballet, whistling a few bars of quaint melody. This was interrupted by occasional grunts needful to preserve his balance. He then essayed to descend the tree. The footing was precarious, and the Dumpling slipped. Nay, more—he fell beyond all recovery. He subsided gracefully backwards into the wooden tub. He was most effectually jammed into this tub; his legs projecting below the knee, his arms above the shoulder. Luckily there was no water in the tub.

"Here, just come and help me out, and don't stand there gaping like a lot of idiots."

The faithful four flew to the rescue. They seized each a leg or an arm, and pulled four different ways, "but not all the king's horses, not all the king's men, could set Humpty Dumpty up again."

"Shove us over, can't you? What puny imps you are!"

They shoved their mightiest, and succeeded in converting him, for the time as it were, into a gigantic tortoise. If only a cast could have been taken of him in that position, a model might have been executed fit to take its place among the

ful myself for fear you should think me greedy."

A murmur of approbation greeted this magnanimous declaration. The trifle was brought forth from its hiding-place, and as the moonlight fell upon its snow-white substance, the eyes of the Jolly Guzzlers flashed with delight.

Daintily they began to sip the superincumbent foam, which melted like nectar in their mouths. Then they came to the more solid composition and its rich sauce. Into this dived the four spoons, and portions were conveyed to the four mouths.

Then with a fourfold groan of amaze-

"Ugh! it's poison!"

antediluvian animals at the Crystal Palace.

The Dumpling eventually crawled out of his shell.

Half the interval between tea and preparation was thus fruitlessly expended. It behoved them not further to waste the precious moments.

"Now then," said the Dumpling as he smoothed his ruffled plumes, "don't play the fool any more. Let us see what the trifle is like. I haven't tasted a mouth-

The Dumpling placed the dish on an extemporised table, and invited his friends to hold out their mugs, which he liberally filled in succession. When all were helped, he gave the word for the commencement of the feast. Simultaneously the four spoons were dipped into the four mugs. Not even yet would the high-souled Dumpling himself partake of the food. He would enjoy the delight of his guests ere his own lips touched the sweet confection.

ment and abhorrence, with a spluttering of disgust, heads were turned aside, mugs were dropped, spoons were dashed to the ground, signals of undisguised distress were rampant, exclamations arose: "Oh, what beastly stuff! Ugh! it's poison." The banquet collapsed, and from the recesses of the old stable there issued a prolonged chuckling laugh, as though some hidden spectre were rejoicing at the discomfiture.

(To be continued.)

GREAT AFRICAN EXPLORERS.

GALTON, ANDERSSON, AND DU CHAILLU.

LIVINGSTONE'S discovery of Lake Ngami in 1849 led to Galton's attempt to reach the lake from the west in 1850. In this he

gun in his gun-bag by the side of his saddle, and rode on; for there is no use in provoking hostilities single-handed with a lion unless

before, and the hyena came in the same way, and tugged at her heel. The poor creature was in a sad state, and I and one of Mr.

A Namaqua Mission Station.

surveyed the Swakop, penetrated into Damara and Namaqua Lands, ascended Mount Erongo, and was eventually turned back by Nangoro, the fat king of the Ovampos, owing to his objection to being counter-charmed by that famous monarch. The Ovampos have a superstition that persons they eat with can charm away their lives, and, writes Mr. Galton, "Nangoro, when a young man, being a person of considerable imagination, framed a countercharm for his own particular use. This, being of course taken up by the court, is at present the fashion of the whole of Ovampoland, and it was to it that I personally objected. The stranger sits down, closes his eyes, and raises his face to heaven. Then the Ovampo initiator takes some water into his mouth, gargles it well, and, standing over his victim, delivers it full in his face." The ceremony not having been performed, the expedition was viewed with suspicion, and, instead of being allowed to proceed as promised, was ordered out of the country, and retreated to Walfisch Bay, from whence it had started. The ground covered was quite new, and the observations made were numerous and valuable. The hunting adventures with the larger game were frequent and exciting. In fact—except perhaps Du Chaillu's, which will occupy us farther on—there is no book on African travel affording more interest to the general reader than "The Explorer in South Africa."

Some of the lion stories are particularly good. One—that of the narrow escape of the servant—is worth quoting:

"Hans was riding old Frieschland, the most useful ox I had, when he saw something dusky by the side of a camelthorn-tree, two hundred yards off. This was a lion, that rose and walked towards him. Hans had his

some object has to be gained by it, as every sportsman at last acknowledges. The coolest hand and the best shot are never safe. After the lion had walked some twenty or thirty yards the ox either saw or smelt him, and became furious. Hans had enough to do to keep his seat, for a powerful long-horned ox tossing his head about and plunging wildly is a most awkward hack for the best of jockeys. The lion galloped up. He and Hans were side by side. The lion made his spring, and one heavy paw came on the nape of the ox's neck and rolled him over; the other clutched at Hans's arm, and tore the sleeve of his shirt to ribbons, but did not wound him; and there they all three lay. Hans, though he was thrown upon his gun, contrived to wriggle it out, the lion snarling and clutching at him all the time. But for all that, he put both bullets into the beast's body, who dropped, then turned round, and limped bleeding away into the recesses of a broad, thick cover, and there died."

The adventures of two other members of the expedition were of a different class:

"This man's nose was seized by a hyena while he was asleep on his back—very unpleasant, and an excellent story to frighten children with. I could hardly believe it until a case occurred—quite *à propos*. An old bushwoman, who encamped under the lee of a few sticks and reeds that she had bent together, after the custom of those people, was sleeping coiled up close round the fire, with her lank feet straggling out in the dark, when a hyena who was prowling about in the early morning laid hold of her heel, and pulled her bodily half out of the hut. Her howls alarmed the hyena, who quitted his hold, and she hobbled up the next morning to us for plasters and bandages. The very next night the old lady slept in the same fashion as

Hahn's men sat up the next night to watch for the animal. I squatted in the shade of her house; my companion covered a side path, and the woman occupied her hut as a bait. It was a grand idea, that of baiting with an old woman. The hyena came along the side path, and there received his quietus."

Galton returned to the Cape from Walfisch Bay, but Andersson, who had been collecting with him, resolved to stay and wander about Namaqualand. Here he spent some time, and then sailing for the Cape, made another attempt on Ngami from thence. He was successful, and with Bechuana assistance arrived there in May, 1853.

He navigated the lake and also the River Teoge for a short distance, but the native opposition proved too strong for him to go very far. Since then, however, Ngami has been reached by Green, Wilson, Wahlberg, and others, and circumnavigated and surveyed by Chapman, who went backwards and forwards many times between it and Walfisch Bay. In 1859 Andersson started on an expedition to discover the Cunene, that narrow, shallow, crocodile-haunted stream, the largest on the Atlantic south of the Coanza, which is now generally held to be our northern frontier on the west coast, and hence the dispute with Germany as to the annexation of Angra Pequena considerably to the south of it.

The explorer's perils and adventures were remarkable. He and Green built a hunting lodge in Ovampoland, and took part in the Damara-Namaqua wars. He was severely wounded in one of the battles, and was only just rescued in time by his gallant companion.

The Cunene, however, was his object, and to the Cunene he had resolved to go. As

soon as he recovered from his wounds, although he was crippled for life, he started for the mysterious river, and, falling in with a Swede named Ericsson, the two journeyed northwards in an ox-cart. They reached Ovakuambe, and got a boat and a native escort, but soon afterwards the natives persuaded themselves that Andersson was dying, and all fled. The two men pressed on alone, and eventually reached the river they sought. Slowly they made their way back, and at Ovakuambe, in July, 1867, Andersson died.

Meanwhile Du Chaillu had been at work on the west coast farther north, and in the course of his extraordinary adventures had explored the country of the Ogoway and Fernan Vaz—since so fully described by Mr. R. N. B. Walker—found the gorilla, and lived with the cannibal Fans and the pigmy tribe of Obongos.

Du Chaillu—of American birth, but French descent—was born in 1835, so that when he began his exploring career in 1856 he was hardly one-and-twenty. Having arranged for an escort with a chief named Mbango, he started for the Muni. His adventures were not long in coming. On the way a large canoe was sighted. In it Mbango recognised one of his defaulting debtors, and to it he gave chase. Gradually the chase was overhauled, and then Mbango sent his canoe alongside his debtor's much larger vessel, and a dreadful hand-to-hand fight took place in order to balance the accounts. Several prisoners were taken by the pursuing creditor, and then, having got security for his bill, he expressed himself satisfied and the combat ceased, after revealing to the full the curious nature of some of the West African commercial forms.

Farther up the river Du Chaillu came on the track of the gorillas in the damaged sugar-cane. He started in pursuit, and, cautiously creeping through the bushes, at last caught sight of four of them speeding along on their hind legs, with heads forward and bodies bent, like hairy men running for their lives. Later on he was brought face to face with the king of the African forest, who glared upon the intruder from the depths of his deep-grey eyes, and then, beating his fists on his breast, rushed forward to throttle the explorer as he fired and shot him dead. Gorilla-shooting is, however, ticklish work. On one occasion one of the men missed his mark, and the angry animal seized the gun and bent it up, and gave the man such a knock-down blow that he shortly afterwards died. Another man had the muzzle of his gun seized by the gorilla as he was about to fire, but, holding tight, keeping cool, and watching his opportunity, had the good fortune to shoot his foe. The gorilla stories told by Du Chaillu were numerous, and by many people were disbelieved. In fact, his statements as to the existence of such an animal were met with a storm of incredulity, and so he went back to fetch a live specimen to prove his case. Nowadays, however, no animal is better known than the gorilla, and the statements as to its height and strength have received all confirmation.

The day after first seeing the gorillas Du Chaillu, when wandering alone, ran up against a Fan warrior and his wife. The astonishment was mutual. The Fans, with their black teeth filed to points, stood open-mouthed with astonishment at "the s...t"—the first white man they had ever seen or heard of—while the white man looked on aghast at the first cannibals he had come across. The first thing he saw when he entered the village—all fenced about with human and gorilla skulls ornamenting the palisades—was a woman running along with a man's thigh fresh roasted from the fire, taking home the family dinner with as much unconcern as a working man's wife in our own country takes home the leg of mutton and baked potatoes from the baker's shop. Outside the hut in which he took up his

lodging was a pile of human ribs, leg-bones, arm-bones, etc.!

With the Fans, now better known as the Mpangwes, the explorer spent some time. To impress them with his power he had at the outset shot two swallows on the wing. For firearms were then unknown to them, their weapons being spears, small poisoned arrows shot from a crossbow so strong that it had to be strung with both feet and hands, and a deadly pointed throwing-axe so whirled as to pierce the enemy's brain.

The King of the Fans—always excepting his horrible cannibalism—proved a fine fellow, and Du Chaillu soon won his favour. He presented him, amongst other things, with a looking-glass. Great was his majesty's delight. "His countenance beamed with joy. I never saw such astonishment as he exhibited when I held the looking-glass before his face. At first he did not know what to make of it, and did not want to take the glass, till Mbéné told him that he had one. He put his tongue out, and saw it reflected in the glass. Then he shut one eye and made faces, then he showed his hands before the looking-glass—one finger—two fingers—three fingers. He became speechless, and with all I had given him he went away as happy as a king; and every inch a (savage) king he was."

With the Fans Du Chaillu went on hunting expeditions, one of which, against a herd of elephants, he thus describes:—"The forest is full of rough, strong climbing plants, some bigger than a man's thigh, many as large as the ropes in the rigging of a ship. These creepers the natives twist together, and after working very hard succeed in making a huge fence or obstruction, not sufficient to hold the elephant, but strong enough to check him in his flight till the hunters can have time to kill him. Seeing that the men were careful in avoiding a certain place, I looked down on the ground, and saw nothing. Then, looking up, I saw an immense piece of wood suspended by the wild creepers, high in the air, and fixed in it at intervals I saw several large, heavy, sharp-pointed pieces of iron pointing downward. The rope that holds up this contrivance is so arranged that the elephant cannot help touching it if he passes underneath. Then the harrow is loosed, and falls with tremendous force on his back; the iron points pierce his body, and the piece of wood in falling generally breaks his spine.

"I also saw in places large, deep ditches, intended as pitfalls for the elephant. When he runs away or roams around at night he often falls into these pits, and that is the end of him, for in falling he generally breaks his legs. Sometimes when the natives go and visit the pit they have made they find nothing but the bones of the elephant and his ivory tusks."

The Fans surrounded the herd, and with wild cries drove them towards the traps. Soon they reached the tangles. "What an extraordinary sight lay before me! I could distinguish one elephant, enraged, terrified, tearing at everything with his trunk and feet, but all in vain! The tough creepers of the barrier in no instance gave way before him. Spear after spear was thrown at him. The Fans were everywhere, especially up in the trees, where they were out of reach of the elephant. The huge animal began to look like a gigantic porcupine, he was stuck so full of spears. Poor infuriated beast! I thought he was crazy. Every spear that wounded him made him more furious. He had just dropped down when I came close to him, and, to end his sufferings, shot him through the ear."

Travelling in Africa is not an unmixed pleasure, to judge from the explorer's story of crossing a certain mangrove swamp on the roots which projected over the water's edge, and which lay from two to three feet apart at irregular distances. "It seemed a desperate venture, but they set out, jumping like monkeys from place to place, and I followed, ex-

pecting every minute to fall in between and stick in the mud, perhaps to be attacked by some noxious reptile whose rest my fall would disturb. I had to take off my shoes, whose thick soles made me more likely to slip. I gave all my baggage and guns and pistols to the men, and then commenced a journey whose like I hope never to take again. We were an hour in getting across—an hour of continual hops and jumps. In the midst of it all a man behind me flopped into the mud, calling out, 'Omemba!' in a frightful voice. Now 'Omemba' means 'snake.' The poor fellow had put his hand on an enormous black snake, and, feeling its cold slimy scales, let go his hold and fell through. All hands immediately began to run faster than before, and to shout and make all kinds of noises to frighten the serpent. But the animal also took fright, and began to crawl away among the branches as fast as he could. Unfortunately his fright led him directly towards some of us, and a general panic now ensued, everybody running as fast as he could to get out of the way of danger."

Space may perhaps be found for another even more exciting snake story, which tells how the traveller, on retiring to rest and fastening the door, caught sight of a python's glittering scales beneath his bed. For a minute or so he stood motionless and considered.

"If the snake were to uncoil itself and move about, it might perhaps take a spring and wind itself about me, quietly squeeze me to death, and then swallow me as he would a gazelle! These were not comforting thoughts. I was afraid to cry out for fear of disturbing the snake, which appeared to be asleep. Besides, no one could get in, as I had barricaded the only entrance, so I went quietly and unfastened the door. When everything was ready for a safe retreat I said to myself, 'I had better try to kill it.' Then, looking for my guns, I saw, to my horror, that they were set against the wall at the back of the bed, so that the snake was between me and them. After watching the snake intently, and thinking what to do, I resolved to get my gun. So, keeping the door at my rear open in readiness for a speedy retreat at the first sign of life in the snake, I approached on tiptoe, and in the twinkling of an eye grasped the gun, which was heavily loaded with large shot. With it in my hand I went towards the reptile, and, fairly placing the muzzle against it, I fired, and then ran out of the house as fast as I could. At the noise of the gun there was a rush of negroes from all sides to know what was the matter. They thought some one had shot a man and run into my house to hide himself; so they all rushed into it, helter-skelter. But they rushed out just as fast on finding a great snake writhing about on the floor. Some had trodden on it and been frightened out of their wits. They roared and shouted, but no one appeared disposed to enter the house again; so I went in cautiously myself. By the dim light of the torch I saw its body had been cut in two, and both ends were flapping about the floor. At first I thought these two ends were two snakes, but as soon as I perceived my mistake I gave a heavy blow with a stick on the head of the horrible creature, and finished it. Then I saw it disgorge a duck—a whole duck, and such a long duck. It looked like an enormous long feathered sausage. After eating the duck the snake had thought my bedroom just the place for him to go to sleep in and digest his meal. He was a python, and measured eighteen feet."

And here this article must end. In 1863 Du Chaillu was at work exploring the Camma country with the intention of making his way across Africa to the Nile. He had reached the east of Ashango Land, when a gun carried by one of the party went off accidentally and killed a native. Instantly his companions were up and ready for battle. In vain Du Chaillu explained; for just as there seemed hope of peace a woman rushed out of one of the huts and shrieked that her hus-

band had been killed by the same bullet. A general attack was made on the expedition,

and, fighting for his life, the explorer had to retreat. At last a river was crossed; be-

yond it his pursuers did not come, and the coast was reached in peace.

The King of the African Forest.

OUR NOTE BOOK.

NEW SWIMMING BATH AT THE POLYTECHNIC.

THE opening of a fine swimming bath at the old Polytechnic adds one more good feature to this already remarkable institution. As most persons are aware, this popular establishment in its old familiar form was finally closed two or three years ago, and within a very short period afterwards was started on an entirely new career of usefulness, under the style of the "Polytechnic Young Men's Christian Institute;" and as an indication of the success that has attended it in this new form, it is said that there are at the present moment over 2,000 applicants waiting to be elected members, and there were last year upwards of 5,500 students in connection with it. This is hardly to be wondered at, for the whole of this extensive building has been transformed almost past recognition, and is now virtually a most efficient technical college, and a social club of quite a luxurious character. The great hall in which the diving bell was the most conspicuous feature has been converted into a fine gymnasium, replete with everything requisite for a thorough course of athletics, and adjacent to this is the new swimming bath. This new feature of the place, like all

the rest of the establishment, is due to the generosity of Mr. Quintin Hogg, who has expended upon this bath and a large apartment over the centre of it something like £8,500. The walls are all of glazed tiles, and the actual tank is seventy-six feet long and thirty feet wide, the depth of water ranging from four to six feet. There is a handsome gallery running round the tank, and below are commodious dressing-boxes. Provision is also made for preserving the water at a uniform temperature. There are larger baths than this in the metropolis, but on the whole it may be doubted whether a more complete and handsome establishment of the kind exists anywhere in the kingdom.

A BICYCLE FEAT.

"Round the World on a Bicycle" is the title of a book which may be expected before many years are over, unless an untimely spill, or some other casualty, should mar the ambition of Mr. Thomas Stevens, a young Englishman who has already crossed the American continent on his bicycle. He started from San Francisco on the 22nd of April, and reached Chicago on July 4th, after a run of forty-two days from the Pacific to the Great Lakes. His time averaged fifty miles a day; his only luggage consisted of a waterproof hat, and when crossing the Rocky Mountains he was sometimes without

food for twenty-four hours at a stretch. When last we heard of him he was in this country preparing for a ride across Europe. He hoped to reach Constantinople by Christmas, and then devote 1885 to a run across Asia. It may interest bicyclists to know that Mr. Stevens rides a fifty-inch machine. Even if he only rides across two continents he will have done enough for fame. Asia at present and for many years to come will probably be bicycle-proof. Even in some parts of Europe it would be hardly safe for Mr. Stevens to pursue his adventurous tour. He does not include Russia in his programme, and he does well, if we may judge from the sensation the first bicycle made the other day on a community of Russian villagers. They had come out in the cool of the evening for their usual chat in the market-place, and were so startled at the sight of the noiseless approach of a wheeled steed mounted by a youth from St. Petersburg, that in the wildest panic they all rushed into their cottages and barricaded doors and windows. The innocent cause of such disturbance soon found out that, although in the Nevski Prospect the road is smooth enough for bicyclists, this is by no means the case among the country folks, and that he must either leave his "self-runner" at St. Petersburg, or take his board and lodging with him when making excursions into the country. The villagers will at present have nothing to do with the wheelman!

ARMOUR IN HISTORY AND ROMANCE.

BY JOHN SACHS.

CHAPTER II.

HE small rings of iron already mentioned seem to have been early utilised as a protection against arrows. They were interlaced in the form of what we call chain mail, and sewn on

a leather tunic.

The chain mail on the Assyrian helmet (Fig. 4), besides other fragments found at Koyunjik, show that this nation was acquainted with this defence.

Virgil, in his epic poem of *Aeneid*, mentions two sorts of chain mail. In a lay of the eighth century a coat of mail of triple links is spoken of as a liberal gift. Then a description of the appearance of Charlemagne and his staff has been given by a monk who wrote towards the close of the ninth century and shows the traditional effect of the appearance

of Charlemagne in his armour, an abstract of which is as follows:—"First came engines of war, with large bodies of soldiers and body-guards, that knew no repose. As the Emperor drew nearer and nearer, the gleam of arms shone upon the people, and then appeared Charles himself, that man of steel, with his head encased in a helmet of steel, his hands garnished with gauntlets of steel, his heart of steel, and his shoulders of marble protected by a cuirass of steel, and his left hand armed with a lance of steel, which he held aloft in the air; for his right hand was kept continually on the hilt of his invincible sword; the outside of his thighs was encircled with plates of steel; his boots and his buckler were of

steel. All those who went before the monarch, all those who marched at his side, all those who followed, had armour of the like, as their means permitted. The fields and the highways were covered with steel, the points of steel reflecting the rays of the sun."

The ancient Britons, at the time of the invasion by Julius Caesar, stripped to fight; but they had shields, bronze weapons, and chariots to which cutting weapons were fixed.

An ancient British gorget of pure gold, preserved in the British Museum, may have been for defence as well as ornament. Of the Saxon arms we have actual specimens found in their graves, illustrations in their missals, and the important Bayeux tapestry. The latter is a piece of needlework, measuring 214 feet in length and 20 inches in height, that was executed at the Court of William I., under the superintendence of his queen, Matilda, who may have worked at it personally. The illustrations record the various historical incidents in the Norman Conquest. A copy, about full size, can be seen in the North Court of South Kensington Museum; a smaller copy can be seen in the Westminster Chapter House, and in most public libraries.

Here is the figure of William the Norman (Fig. 8), copied from this tapestry. He wears a conical cap with a band at the side and a broad rim at the bottom, to which is attached a nose-piece; his body is covered with an armour of some kind of chain mail; in his hand he carries a mace or club; he is mounted on a horse of a red colour.

Fig. 8.

William the Conqueror, from the Bayeux Tapestry.

In another part of the work William is seen giving Harold arms. Harold is represented already in chain armour, and William is putting the iron cap on Harold, holding it by the nasal piece.

In yet another part of the tapestry "armour-bearers" are seen carrying the chain armour on lances. This chain armour was called by them "byrnie." The Early English laws of Gula were passed in the middle of the eighth century, and required every man who possessed six marks in addition to his clothes to furnish himself with a red shield, a spear, and an axe or sword. He who was worth twelve marks was to have an iron cap also, and he who was worth eighteen marks a byrnie in addition.

(To be continued.)

STRANGER THAN FICTION;
OR, STORIES OF MISSIONARY HEROISM AND PERIL.

THE MARTYRED BISHOP.

THE boyhood of Bishop Patteson, as told in his letters from school—all of which nearly, from the first in round childish hand to the firmer writing of his college days, have been preserved—was a singularly happy one. The son of the eminent judge, Sir John Patteson, and connected with the Coleridges through his mother, he was fortunate in finding relations in high places throughout his life. His first school was at Ottery St. Mary, in Devonshire, near which lived his uncle and grandparents. From here the letters tell of much cricket, riding, and running races, in which Patteson would seem to have taken great interest, and he certainly took immense interest in “the fire-works on the fifth,” to judge from the delight with which he speaks of them. Of the time devoted to his lessons he made, however, excellent use.

He went to Eton in his eleventh year—he had been born in April, 1827—and was placed in the lower remove of the fourth form and boarded in the house of his uncle, Edward Coleridge. The same year he writes home how at the Montem, when the Queen was going to Salt Hill, he was crowded against the wheels of her carriage, and would have been forced under them had not her Majesty caught hold of his hand and held him up as she moved along. Later on we get a description of Windsor Fair—to which the boys a few years afterwards were forbidden to go—where three of his school-fellows were arrested for noisy conduct, and rescued by four hundred and fifty others in a regular free fight, in which rotten eggs and crackers were vigorously used. These are but foils, however, to a praiseworthy work. Later on comes a charming letter: “Rejoice! I was sent up for good yesterday at eleven o'clock school. I do not know what copy of verses for yet, but directly I do I will send you a copy. Goodford”—the late lamented provost—“when I took my ticket to be signed (for I was obliged to get Goodford,

Abraham, and my tutor to sign it), said, ‘I will sign it most willingly,’ and then kept on stroking my hand and said, ‘I congratulate you most heartily and am very glad of it.’ I am the only one who is sent up.”

Patteson.

At sixteen he was in the upper fifth, and, not having neglected his cricket, found a place in the eleven, and became captain before he left. While in the position of one of the cricket leaders of the school an event occurred in which his true character shone forth unmistakably. A custom had arisen among some of the boys of singing offensive songs at the annual cricket and boating dinner given by the eleven and the eight at the hotel at Slough, and Patteson, who was one of the entertainers, gave notice before it

took place that he was not going to allow anything of the sort while he was there. All went well for a few minutes after the dinner was over, and then one of the boys began to sing some objectionable ditty. “If that does not stop,” shouted Patteson, “I shall leave the room.” No notice was taken of this, and so he, with three or four other brave lads, rose and went away. He then sent word to the captain that unless an apology was offered he would leave the eleven. After some hesitation the apology was forthcoming, and he remained.

He was one of the best cricketers that Eton ever brought to Lord's. In his first year, 1843, the College lost by twenty runs, but in the second it won by an innings and sixty-nine, a victory chiefly due to Patteson, who went in first and made fifty by steady play such as thoroughly broke the back of the bowling. In the Winchester match the same year, which looked like another runaway win for the Light Blues, Ridding, the Wykehamist captain, now Bishop of Southwell, played so splendidly with all the luck against him that the Etonians were in despair, and only won by twenty-seven, saving the match by adopting a suggestion of Patteson's as to a change in the bowling. In 1845, memorable for the tie-match with Winchester, Harrow was defeated by an innings and one hundred and seventy-four runs, making only thirty-two and fifty-five to Eton's two hundred and sixty-one. At Oxford Patteson, finding it would take him too much away from his studies, did not continue his cricket, although invited to do so to represent his University.

For he had then thoroughly entered upon his preparation for the Church. His college career was a satisfactory one, and he became a Fellow of Merton. To finish his education he travelled a good deal on the Continent, studied Hebrew at Dresden, and became a thorough German scholar. Already he had developed that facility in acquiring languages.

Norfolk Island.

which was to be of so much value to him later on. In 1853 he was ordained, and became curate of Allington. In two years' time he resigned the appointment and devoted himself to missionary work.

As far back as 1841, when in his fourteenth year, he had been much impressed by a sermon from Bishop Selwyn, who was then in this country on a visit from New Zealand. The bishop, on the other hand, was favourably impressed with him, and even asked that "Coley"—such was his nickname, his Christian names were James Coleridge—should be given him when old enough to help him in his enterprise in the islands of the Pacific.

No wonder that the bishop found Patteson an enthusiastic admirer. No man had a larger measure of that magnetic influence which wins the minds and hearts of men. As has been well said by Mr. Gladstone in the "Quarterly Review," with regard to the influence of this interview on Patteson's future life, "Of a commanding presence, of frank and manly character, distinguished both in mental and bodily pursuits, and universally beloved, he was, as it were, reflected in his young friend, as to all their points; and in quitting a career of prosperity and promise, already well begun at home, for the charge of an unformed church in an unformed colony at the Antipodes, it had been the bishop's happy lot to lift the standard of self-sacrifice to a more conspicuous and a more generally felt and acknowledged elevation than it had heretofore reached among us. But we feel confident that a Selwyn claims and can claim no higher honour than to have had a Patteson for his pupil."

It was not without much anxious thought that Patteson resolved to give up his prospects at home and go out with the bishop, and the parting from his father and sisters cost him many a pang. Of the last farewells his biographer, Miss Charlotte Yonge, has given us a picture speaking eloquently to all by the thorough genuineness of the home life it reveals. To avoid unnecessary fuss he resolved to walk to the coach that would take him on to Cullompton, the nearest railway station. The last kisses were exchanged at the door, and the sisters watched him out of sight. Turning round they found that their father had left them. Silently looking for him in his room, "they saw him with his little Bible, and their hearts were comforted concerning him." Patteson on his road turned into the churchyard, picked a few primroses from his loved mother's grave, and then resumed his journey.

He left Gravesend in the Duke of Portland on March 28th, 1855, and on the voyage out the bishop explained to him the system on which he was to work. Selwyn's plan was never to preach where missions had already been started, so as to avoid all semblance of opposition and all chance of sectarian jealousy; and owing to the wide dimensions of his field he had organised a method of educating natives as teachers, as being the fittest instruments for appealing successfully to the islanders. At St. John's, near Auckland, there was a college established, and thither native boys were brought to train and instruct. After a time the college was removed to a more favourable site at Norfolk Island, famous as the abode of the descendants of the Bounty mutineers, and thence it received a further move to a more central position on Mota, or Sugarloaf Island, in the Banks Archipelago.

Patteson entered on his work with much quiet enthusiasm, and his success was unexampled. Without any parade he quite won the hearts of those to whom he appealed, and laid the solid foundation of lasting good. He had a horror of the pretentious and theatrical, would never even speak on religious matters to a man who was sick unless the man was alone, and would never preach to a mixed audience, but dismissed the whites first, and

then alone with the islanders would speak straight to their hearts with words of such sweetness and quiet power as always proved effective. Teaching rather than preaching, however, was what he specially aimed at; to work with as well as for his flock was his ambition. The acquisition of the many languages spoken in the different islands, which would have been so difficult a task for an ordinary man, came easily to him. Before he died he had printed thirteen elementary grammars and three vocabularies!

And in mere manual work he was not behindhand. As he himself said, "Many trades need not be attempted, but every missionary ought to be a carpenter, a mason, something of a butcher, and a good deal of a cook." And with regard to his labours in these capacities the old Maori's sagacious remark that "Gentleman-gentleman thought nothing that ought to be done at all too mean for him, while pig-gentleman never worked," may profitably be borne in mind.

In 1861 he was consecrated Bishop of Melanesia. Lady Martin, who was present, describes the ceremony as "altogether a wonderful scene; the three consecrating bishops all such noble-looking men, the goodly company of clergy, and Hohua's fine intelligent brown face among them, and then the long line of island boys and of St. Stephen's native teachers and their wives, were living testimonials of mission work."

For ten years he was unrelenting in his toil for the good of his diocese. Voyage after voyage he made, cruising from island to

island. First he had been in Selwyn's schooner the Undine, then he had a long cruise in the Sea Breeze, and when he met with his death he was in the Southern Cross.

The tragedy occurred at Nukapu on 20th September, 1871. The Southern Cross was feeling her way up to the island, and was stopped by the reef, over which the blue waves were curling in the bright sunshine. A boat was lowered, which, after some distance had been traversed, was met by four native canoes, the man in one of which invited the bishop to join them. As he had found that confidence was generally gained when he landed in this way, he left the ship's boat and in the canoe crossed the reef and was taken ashore. He was never seen alive again. After an interval the canoe came drifting back, apparently empty, but as it passed the boat the sailors found to their horror that the bishop's body was on its floor. He had been murdered by the natives in revenge for the atrocities of the kidnappers, who in the "thief ships" and "snatch-snatch" ships, as the natives call them, feed the coolie trade.

In him the Gospel lost one of its truest and noblest preachers and the world one of its best of men. "As he taught," wrote Tagalana, translated by Mr. Codrington, "he confirmed his word with his good life among us, as we all know. He did not despise any one, or reject any one with scorn. Whether it were a white or a black person, he taught them all as one, and he loved them all alike."

and White resigned.

NOTES ON THE GAME.

(a) Black ought to have played either P to Q 3 or Kt to K 2, as White's next move

shows, which threatens check in two places, and the capture of the B or the R.

(b) White would not have gained the Q P by taking the Kt, because the K would have taken the B.

(c) The struggle for the R's P becomes interesting.

(d) If 33, Kt×P, then B×Kt. 34, R×B, Kt—K 7 (ch.), and Kt×R.

(e) Black did well by waiting to take the Kt, and let the P go to R 6.

(f) The defence of R to KB sq. would have been the safer one, whereupon the Q would have taken the R's P.

(g) If K—Kt 2, then B—K 8 (d. ch.). 40, K—R 3, Q—B 8 (ch.). 41, K—Kt 4, Q—B 5 (ch.), etc.

Correspondence.

5. A. G.—There is a "very large stock of magic lanterns and slides and lenses and fittings" at Hughes's, 82, Mortimer Road, De Beauvoir Square, N., but ordinary opticians have enough for you to choose from.

CHEQUER.—The British Chess Association law as to a pawn taken in passing is No. XII. It reads: "Should a player be left with no other move than to take a pawn in passing, he shall be bound to play that move." The rule as to queening a pawn follows: "When a pawn has reached the eighth square the player has the option of selecting a piece, whether such piece has been previously lost or not, whose name and powers it shall then assume, or of deciding that it shall remain a pawn."

SIRIUS.—1. The line is correct; to pass a line afar from another line is to send it off at right angles. 2. If you know that Saturn is in Taurus, and you find in Taurus a large star that is not shown or mentioned in maps of fixed stars, it is reasonable to suppose that the unknown can be no other than Saturn. It is not customary to show the planets in maps of the constellations.

SCHIO.—The Schio Liao is a paste made in China, and consists of fifty-four parts of powdered lime, six parts of powdered alum, and forty parts of fresh blood, mixed up together in a homogeneous mass. It will fasten stone, porcelain, or any hard substance.

KIRKCALDY.—1. If you are healthy, opening your eyes under water will not hurt you. 2. In very smooth water a paddle steamer would perhaps be the fastest, but under all other circumstances the screw would win. 3. Jules Verne was born in 1828. 4. There is no difference.

C. P.—Buy the second volume, and read the treatise on cricket that it contains.

GANNET.—You can buy marine glue at a penny a stick at nearly all indiarubber shops. You make it by melting indiarubber in naphtha, and adding twice as much shellac. There is another glue made by dissolving twenty grains of indiarubber in two fluid ounces of chloroform, adding four drachms of powdered mastic, and letting the mixture macerate for a week. It must be kept cool and well-corked.

H. R. WASHINGTON.—1. Sir Ralph Abercromby was mortally wounded at the decisive battle at Alexandria on January 21, 1801, when the French were driven out of Egypt. He died seven days afterwards on board the admiral's flagship. 2. There would be the same range of excellence amongst the boys, no matter at what age the limit was put.

W. HARRISON.—Try Loomis's "Practical Astronomy," published by Sampson Low and Co.; Chambers's "Practical Astronomy," published by the Clarendon Press; Admiral Smyth's "Celestial Cycle;" "Herschel's Manual," etc., all standard works, obtainable through any bookseller.

THE WOULD-BE SAILOR.—1. According to some authorities, the first ironclad was the Merrimac, used by the Confederates in the American War. The Monitor turret-ship is of the same date, but Captain Cowper Coles was prior to Captain Ericsson. It is in fact the old story, the "first" inventor can never be mentioned without an earlier one putting in a claim. 2. Buy "Under the Red Ensign, or How to go to Sea," price one shilling, from any nautical bookseller.

PICKWICK.—The only satisfactory way of procuring a skeleton is by maceration, which is odoriferous but sure. The ant method is all very well, but in the first place you have to find the hill, and in the second you have to provide against the body being removed by some other agency.

A TAKER OF THE "BOY'S OWN PAPER."—For fowl dealers consult the advertisements in the "Exchange and Mart," or the catalogue of some poultry show.

BASINGSTOKE and Others.—It would be of no interest whatever for us to fill our columns with the elementary geography of our native land. If you want to know the road from one place to another buy a map; if you do not understand a map buy a geography and learn.

I. W.—For instructions in the management of calves consult some dairy manual, or apply to some agricultural newspaper. Since writing this it has occurred to us that perhaps you mean the calves on your legs. If so, we are unable to tell you how to "grow them." We believe that their abnormal development is a trade secret, never communicated previous to the assumption of the plush!

AN OLD SUBSCRIBER.—Cover the clothes-basket with American cloth, or tarpaulin, or oiled canvas, or macintosh. Either will do for a coracle. Learn to swim before you trust yourself inside it! Even a proper coracle is a most crazy craft.

PAT.—What do you mean by "accidentally"? Where is the umpire to draw the line? If the ball is touched by the hands the penalty must be enforced.

FEET.—The title-page, index, and plates of the fourth and fifth volumes cost one shilling and eightpence per packet. They are in stock.

M. LONG.—1. Read Croll's "Glacial Period." 2. Crinoids are still existent. See the Challenger reports. 3. No. The sunsets began before the eruption. 4. The only magazine is the Geological, published by Trübner and Co.

H. H.—See the "Thrones of the Ice King" in the fifth volume. The Alert was presented to the United States Government.

A. RICKARDS.—The articles on "Fishing Tackle and how to make it" began in No. 105, and ended in No. 135, in Vol. III.

NESTOR.—They are not initials. A E I (pronounced A I) is Greek for "for ever."

BRITON.—Guides to Army Examinations are published by Stanford, of Charing Cross. The age is from seventeen to twenty.

KING'S COUNTY.—1. Answered over and over again. The number on the last copy will tell you. Count back. 2. Both subjects have been exhaustively treated. See indexes. 3. Certainly not. Our columns are much too valuable to serve as refuges for amateur discussions on political squabbles.

H. K. HOLDEN.—1. The equinoctial games take place at the equinoxes, Lady Day and Michaelmas, and last over a few days. 2. Yes. There is, perhaps, no disease that is not now curable in its early stages. It is only a question of taking it in time.

S. H. HARE.—You will find an article on "My Flag-staff, and how I rigged it" in No. 86, in the October part for 1880.

H. S.—If you want to go for a sailor apply at the Mercantile Marine Office at Liverpool. No ships go to Fleetwood.

REDFEATHER.—The egg articles were in the second volume. Read them.

MILITARY CIVILIAN.—The only way we can suggest for you to increase your growth to army height is to emigrate to Australia. It often happens that lads who have apparently stopped growing in this country take a fresh start under the sun of the Antipodes.

WOULD-BE CHEMIST.—1. The articles on "Pharaoh's Serpents" was in the May part for 1881. 2. We cannot here describe the manufacture of whisky. 3. You will become a naturalist more rapidly by leaving off the whisky.

ATHLETE.—There is only one satisfactory way of cleaning wash-leather articles, and that is to take them to pieces, clean the leather, and make them up again.

A WEE TROUT.—1. There is no good fly-fishing near London, and it would be useless to recommend any place under such circumstances. 2. No.

W. H.—We have reprinted, and all the volumes are again in print at the published price of six shillings for the first and seven shillings and sixpence for the others.

A. V. TIERNEY.—Messrs. Hachette, of King William Street, Strand, are French publishers and agents, and you could get the books you require by applying to them.

CAPTAIN NEMO.—Our knowledge of the mails is derived entirely from the Postal Guide, and that you can get yourself at any post-office, price sixpence.

A LOVER OF THE SEA.—In nearly every seaport town there is a nautical warehouse where such books are sold. The Science and Art Department hold examinations in Navigation. Apply to South Kensington for particulars. Messrs. Norie and Wilson, of the Minories; Potter, of the Poultry, and others, will forward you catalogues if applied to.

BOB.—"Ora pro me" means simply "Pray for me."

CLERK.—Nor are you likely to. What interest do you think it would be to our readers to be informed "what percentage your writing would be allowed at an examination"? Such questions are promptly consigned to the waste-paper basket, as they will eventually be answered by others—examiners, to wit.

YOUNG ENQUIRER.—1. Leave it alone. 2. The frosting on the cards is made by coating them with gum, and sprinkling them with powdered glass.

DARDANUS.—For all particulars as to the movements of ships apply to Lloyd's, Royal Exchange, London. You will always be told if any particular ship has arrived or been heard of. Send a stamped envelope.

LT. METTON.—You should get an indiarubber stamp, and mark your pigeons on one of the wing feathers. This is the method adopted by the flying clubs.

B. REECE.—One of the principal depôts for American fretwork machinery is at Churchill's, in Sun Street, Finsbury. Their catalogues are sent on application.

W. H. STYLES.—The coloured plate of the Viking Victory refers to the story of Sigvald.

TEDDY.—1. The theory is an accepted fact, and the literature on the subject no longer worthy of notice. 2. The articles on Dogs were in the second volume.

EYES AS SHARP AS A NEEDLE.—Messrs. W. H. Smith and Son's offices are at 186, Strand, London, and it is there that you should apply for information, and not at obscure country platforms. The mistake in the date appears in only a part of our edition. We cannot give any "rules for the cricket season," as the season would prefer making its own.

DAMON.—1. See our article on the last football season. The club you mention does not even reach second-class form. 2. Yes.

ATHLETE.—Give your shoes a good coat of dubbin, or, when they are wet, dose them well with castor-oil or Russian tallow.

CYCLER.—The Cyclists' Accident Insurance Corporation is at 15, Coleman Street, E.C. The annual premium for machines under £20 in value is twelve shillings and sixpence, for those under £30 it is fifteen shillings. Apply to the secretary for particulars.

CLIPPER LAD.—The America was ninety-five feet on deck from stem to stern, eighty feet keel, and twenty-three feet amidships. She drew eleven feet of water in sailing trim. Her masts were seventy-nine feet six, and eighty-one feet long. Her main-gaff was twenty-six feet, her main-boom fifty-eight feet, her bowsprit thirty-two feet. She was built of white oak, locust wood, cedar, chestnut, and heckmatack, and the frame was strengthened with diagonal iron braces four feet apart. Her cutwater was a prolongation of herself, and had no false wood. She was painted lead-colour.

STUDENT.—1. No question of rightful heirship can arise when elected by the people. 2. See the Almanach de Gotha. 3. All foreign governments have the right to open private letters.

J. MORRIS.—1. Better pronounce the name as spelt. The ear's family pronounce it Cooper, but there is no proof that the poet did so. 2. The locals make one syllable of the "mare," but it should properly have two. Call it Weston, and evade the difficulty.

ANXIOUS BILL.—We see no reason why you should not tell your father that you have been saving money out of what he has given you for food. At the same time we think that the amount he allows you is not excessive for the purpose he states, and that to save out of it is to run very close to the line where wise thrift ends and short-sighted avarice begins. Your fear at the result shows that you are very much of the same opinion. Better good health than a deep purse.

HEADS OF OUR GREAT SCHOOLS.

(Continued from page 32.)

1. REV. A. R. VARDY, Birmingham.
2. MR. WELDON, Dulwich College.
3. DR. KYNASTON, Cheltenham.
4. DR. PERCIVAL, Clifton.

(To be continued.)

SPIDER.—The reason of the failure is either that the lamp is not strong enough, or the lens is not in focus. A feeble colza-oil lamp is of no use; you must have a very bright light, which you might perhaps obtain easiest by having it in a lantern outside.

J. R. L.—Write to Bible Society's House, Victoria Street, Blackfriars, London.

G. H. L.—Give your skylark a good cage, open in front only, with a bend in it; no perches, but a nice green turf in the bend in front. Feed on bread-crumbs, with a little crushed hemp-seed, and give also table scraps. Draggle the crumbs with milk.

E. W. GOWING.—No; give slugs, and in winter a little finely-minced fresh meat. We think it is the ordinary thrush from your description, though probably oddly marked.

E. T.—Weakness of constitution alone caused the death of your young birds. You probably also made the mistake of breeding too early in the season.

G. H. R.—Get ordinary green tea, and make an infusion about the colour of brandy. Use this when cold as a lotion, twice or thrice a day, pouring about a teaspoonful into each ear, and retaining it for a minute. Give the dog a dose of castor-oil once a week, and let him have well-mashed boiled greens in his food thrice a week.

JAMES D.—1. Too long to insert. See our papers on poultry. 2. You can only prepare fowls for show by proper attention months beforehand to their feeding and health, and by keeping them apart from other fowls that might destroy their plumage. All trimming or clipping is illegal, and can easily be detected.

DOGIMUS.—Five grains of powdered alum to an ounce of water make a very handy eye-lotion for dogs.

T. HAMLET.—Your fowls died of inflammation, but of what kind only a post-mortem could have revealed.

H. W. H.—You must feed the canary more plainly, but we fear you can do little else. It is asthma, and nearly always fatal. Put saffron in the water, and give three drops of castor-oil, warm—not hot—twice a week.

E. J. TOBY.—"Gapes" is a disease caused by worms that infest the throat. Treatment is most unsatisfactory, but it can be prevented by clean, wholesome food, and perfect attention to dryness and cleanliness of yard and run.

BOARHOUND.—Give him Spratt's biscuits, also some of the cod-liver-oil cakes sold by the same firm. He will need no other medicine.

REINDEER.—Your cat is a Persian.

A CONSTANT READER.—But it *must* be your fault. If your fowls go like that they either have unclean water, bad feeding, or are kept in a damp or dirty condition. Use a little sulphur ointment to the bare places. Do they get exercise and sunshine?

NARCISSUS.—There is no difference between the size of house and tree sparrow's eggs; if any, the latter have it. Buy the monthly part, price sixpence, and consult the plate.

A BEGINNER.—Certainly the fungus is a disease in fishes, caused by overcrowding as much as anything else. But you must clear out your whole place and begin again at the beginning. Put in only wholesome fish, and let the water be purified by vegetation, and have occasional sunlight.

SKYLARK.—Six questions all of a lump! It would take a naturalist an hour to answer them all orally. The wren isn't the tomtit, and there couldn't be a cheap book on birds. The number you inquire after is sixpence.

PATTERN MAKER.—You will find a good deal about turning in the "Amateur Mechanic" and in "Lathework," by Paul Hasluck. You would find a good many references in the index numbers of "Amateur Work."

C. D. VIDE.—1. Stop the rape. I suppose you mean a canary, though you don't say so. 2. Your sister is right.

ULIC.—Well, then, in mercy sake, let the poor squirrel go. It will never be tame, though it may get broken-spirited and quiet.

STONEYCROFT.—All such things are tokens. Coins have the monarch's head.

Our Portrait Gallery.

(Continued from page 32.)

IN continuing the portraits of the Heads of our Great Schools, we have engraved the four in this week's number from photographs as follows:—Dr. Vardy, of Birmingham, from a photograph by Mr. H. J. Whitlock, New Street, Birmingham; Mr. Weldon, of Dulwich College, from a photograph by Mr. S. A. Walker, Regent Street, London, W.; Rev. Herbert Kynaston, D.D., of Cheltenham, from a photograph by the County of Gloucester Studio, Cheltenham; Dr. Percival, of Clifton, from a photograph by M. Guttenberg, Clifton.

SCHOOL AND THE WORLD:

A
STORY OF SCHOOL
AND
CITY LIFE.

BY PAUL BLAKE,
Author of
"The Two Chums," "The
New Boy," etc.

CHAPTER V.

It would be difficult to exaggerate

rate the unpleasantness of Lang's sensations as he obeyed the Doctor's summons. What could he be wanted for except about that wretched visit to the Rummageroom?

Could Mr. Pickering have seen him coming out of it? He did not think that was possible.

"Hush!" whispered Tommy, "you'll wake them."

Very rarely had he seen the Doctor looking so angry as on this occasion. A boy notices anxiously a master's mood when he is concerned in its results.

"You were in the Rummage-room this afternoon, Lang," began Dr. Fellowes, abruptly.

Lang looked down guiltily.

"Why did you not say so an hour ago when I asked who had been there?"

"I didn't like to, sir; I was afraid you might think I had something to do with the disappearance of Simpson's money."

"Do you think I shall consider it less likely now that I find you have concealed your visit there and tried to deceive me?"

"I only took a ball out of the box," protested Lang. "I haven't any notion which is Simpson's box even. I never touched a thing whilst I was in there."

He spoke angrily, with a sense of injustice. Dr. Fellowes smiled sternly.

"Had you not better wait till you are accused before you assert your innocence so warmly? I have only accused you of deceiving me about your visit to the room. As it happens, I know on excellent evidence that you went there, and, fortunately for you, you were watched the whole time you were there. I don't think you guilty of anything worse than an attempt at deception, and of that you cannot clear yourself, can you?"

"No, sir."

"Very well. I call your conduct cowardly. You must have been doubtful of your own character, or you would not have hesitated to own everything when I asked. The result of it is that, as by accident I was able to discover what you thought you had concealed, you have shaken my faith in you. I had hoped that you were reforming this half; you know I had grave cause to be dissatisfied with you. This episode has not tended to confirm me in my hopes. You will write out the first six odes of the second book of Horace, with translations of the first three. You may go."

Lang obeyed. The tea-bell had rung, and some of his form were wondering where he was. He didn't feel much inclined for tea, but he determined to brave the whole affair out. The Doctor had been unjust; of that he was sure. It was no good trying to keep straight if something were always happening to pull him back again. Why should he care? It was a lot of trouble to work hard and keep out of mischief; it was much better fun to take things easy and chance the result.

"Hallo, old man, what's up?" asked Ferguson as Lang took his seat. "The Doctor seems to have a fancy to-day for interviewing us; he's beginning to appreciate the delights of our conversation at last."

"Not much," returned Lang, with a laugh. "One can never get a word in edgewise when he's begun to speak. He's like Tennyson's Brook—goes on for ever."

"Quoting Tennyson!" exclaimed Dickson. "Have you been reading him up in order to make us feel small?"

"I say, Soady," continued Ferguson, "what on earth did the Doctor want you for? Is he going to persuade you to play 'Auld Lang Syne' to Mrs. Fellowes?"

"No, he isn't," replied Soady; "I don't know it quite perfectly yet."

There was a small roar at this, which was said with perfect gravity. Soady hoped that it would turn the talk from a topic which he wished to avoid, but his manoeuvre failed.

"Then what did he want?" persisted Dickson.

"Never you mind," replied Soady, mysteriously. "I didn't bother you about it last time he sent for you."

This was carrying the war into the enemy's country, for it was notorious that the last time Dickson had visited the Doctor it was to expiate an offence by corporal punishment. Dickson was still very sore on the subject, and looked daggers at Soady, whose round, good-natured face expressed an utter want of malice.

No one else seemed inclined to question them, so the talk drifted round to other subjects. But Lang had been an eager listener to what was said. He had not known of Soady's interview with the Doctor. It flashed across his mind at once that he had seen him go into the Rummage-room and had told the Doctor.

"The wretched sneak!" he said to himself; "if I don't pay him out for this!"

Soady glanced down the table and saw the appealing face of Tommy turned towards him. Since he came to St. Mary's Tommy had never spent so long a time without speaking to his friend, and the world now seemed blank to him. A funny little chap he was, rather pitied and looked down upon by his companions, but in one thing at least he far outshone them all—his loyalty to his friend. Soady had been very kind to him, and there was nothing Tommy would not have done in return. And now his friend had avoided him ever since the beginning of afternoon school, had interviewed the Doctor (a most tremendous event) and never said a word about it since. Tommy was upset; he had no one to confide his trouble to; he became utterly miserable.

Soady caught his appealing glance and resolved to see him some time during the evening and put matters straight. But directly tea was over preparation began; then Soady had to go to the first-form room to attend a cricket committee, and poor Tommy had no chance of speaking to him. He thought his friend was still avoiding him on purpose.

This would never do. Tommy resolved to write a letter to him. "Dear Soady,—I don't know why you are angry with me, but I'm very sorry. If I've done anything wrong you can lick me if you'll be friends again. Tommy."

The question then arose how to get this conveyed to its destination. Soady would not come out of the first-form room again before bed-time, and their bedrooms were a tremendous distance apart; in different wings of the building, in fact.

He caught sight of Dickson returning to the schoolroom for a book. Plucking up his courage he went up to him.

"Please, Dickson, would you mind giving this to Soady?"

He held out his note timidly.

"All right," said Dickson, pocketing it. Tommy was for a time relieved in heart, but how miserable he would have been had he known that Dickson forgot all about his precious epistle, and happening to want a spill to light another jet of gas with, drew from his pocket the first piece of paper he put his hand on and lit

it. That piece of paper was Tommy's note.

CHAPTER VI.

BED-TIME came, and Soady had given no sign of his existence. Tommy was in despair. What had he done to be treated so heartlessly.

There was plenty of noise and confusion in going upstairs and undressing, and even Tommy could not fail to take a passing interest in Featherstone's latest trick of arranging Simpson's basin of water so that it fell over directly it was touched. But when the gas was out and the boys gradually dropped off to sleep his misery returned: the silence of the night only made his loneliness the more oppressive.

It may seem a trifling cause for misery to those of you who are full of life and spirits, who have plenty of friends and a lot of enemies to keep things lively for you; but picture yourself in Tommy's place, fresh from home, knowing no one but his one friend, and then finding that one friend prove faithless.

Tommy could stand it no longer. He tried to cry himself to sleep, but failed. At last a desperate resolve came into his mind: why should he not make an excursion to Soady's room and see him for a minute? He knew the way well enough; there was quite enough moonlight for him to find it; every one was asleep long ago; he had nothing to do but open the doors carefully and not make a noise. Besides, most of the doors were open, for the night was hot.

Why hadn't he thought of it before? He listened a moment for any sound, but all was silent. He crept out of bed and made straight for the door. A slight push, and he was in the passage.

Along the passage, and then, after a turn to the right and six steps down, was a corridor leading to the other wing. The third door along the corridor was Soady's room.

So far he reached without the slightest misadventure; but the door of No. 8 creaked, and he stopped suddenly.

No noise! He pushed it a little farther, it creaked again. But Tommy was bolder now; he sidled into the room and crouched behind a bed.

There lay Soady and three other boys, all unconscious of their midnight visitor.

Tommy crept up to his friend's bedside and gradually put his hand into his. He waited anxiously for him to open his eyes. He did at last, and there stood Tommy by his side, with his finger on his lips.

"Why, Tommy!" exclaimed Soady; "what's the row?"

"Hush!" whispered Tommy; "you'll wake them."

"All right!" returned Soady, in a low voice. "What's the matter? Are you ill? You'll catch cold out there; come in here with me."

Tommy crept into the bed, and, hiding his head beneath the clothes, burst into a fit of crying.

"Hey, gently, Tommy! you'll break a blood-vessel! Who's been licking you? I'll teach him!"

"Tisn't that," said Tommy; "I thought you were angry with me."

"And you're crying about that? Why, Tommy, what put that into your head?"

"You ran away from me, and you haven't spoken to me, and I sent you a

letter, and you never answered it, and I couldn't bear it any more," sobbed Tommy.

"There, never mind; it's all a mistake, I never had your letter," said Soady.

He let him have his cry out, thinking that perhaps he had not been wise in keeping the youngster so much out of the company of those of his own age. What would he do when he was left alone at the end of the half?

However for the present the kindest thing was to disabuse his mind of the idea that he was offended with him, so Soady told him all about the interview with the Doctor, under a pledge of secrecy which he knew Tommy would never break.

"What's that?" exclaimed Tommy, at last. "I thought I heard some one!"

Apparently it was a false alarm, but it brought to their minds the fact that it

was quite time Tommy went back to bed. He crept out, and, first satisfying himself that every one was asleep, stole out of the room.

He did not notice that Melhuish was watching him out of the corner of his eye, still less did he or Soady guess that Melhuish had been an interested listener to the whole of the secret history of the Doctor's investigation of the robbery.

(To be continued.)

ONE OF MOTHER CAREY'S CHICKENS.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "A Dunce's Disasters," "The White Rat," etc.

CHAPTER IV.

THE banquet was indeed a failure. Its immediate effect on the Dumpling was to make him unusually irascible, and his club was employed the next day to the no small tribulation of sundry small boys. Crestfallen and humiliated in the eyes of the guzzling fraternity, he felt that his prestige as a confectioner had suffered irretrievable disgrace. He had to brook the satirical smile of Stodge, the gruesome gibes of Grubbins, the banter of Buffles, and the jeers of Guzling Jim. And he was conscious that they discussed the trifle with language more than a trifle derogatory to his dignity.

It was clear that the Dumpling had considerably lost caste by the late failure. He could not count upon the allegiance of his followers. The existence of the club hovered on a very precarious tenure. Created with the object of providing from time to time a dainty repast for its members, it had signally failed at the outset, and all confidence in future successes was as unsubstantial as the froth of beaten eggs.

The Dumpling meditated upon these things the afternoon following his ill-starred feast, as he sauntered aimlessly about the field. He looked at the hollow in the old willow-tree. No sign of a hen's domestic details; the nest was no more; the wandering winds had made havoc of its substance. The Dumpling hummed an air and banged the tree with his club. No rustle of wings, no scuttling of legs, no agitated cluck sounded in response. The echoing wall gave back the stroke, and that was all.

The fat boy sighed as he moved off in the direction of the hen-yard. He had a few grains of Indian corn in his pocket. History often repeats itself. He leant over the railing and called the attention of the poultry by the "Coop, coop!" that brings to their minds the remembrance of feeding-time. A general clamour of voices ensued; the young birds bustled up, the old ones jerked their heads and peered about, and comported themselves with the dignity befitting old birds who were not to be caught by chaff. The Dumpling threw in two grains, for which there was a flurry and scuffle. The old Cochin China hen was there, but, being somewhat stiff in the legs, she was nowhere in the race for the prize.

The Dumpling watched their manoeuvres, and as he watched he pondered. For full three minutes he stood in the attitude of one absorbed in thought. An

idea seemed to strike him, for he struck a mighty blow with his club upon the paling. Then thought took action.

His last grain of corn was carefully bored through with a nail. He then took from his pocket a coil of string, one end of which he fastened securely to the grain of corn. The other end was made into a loop and slipped over one of the buttons whereby his nether garments were braced. He then watched for the near approach of the particular hen, and threw the grain to her under the lowest rail. She flew upon the spoil, mindful, no doubt, of similar delicacies erewhile enjoyed. She swallowed it with a gulp and cackle of satisfaction.

The Dumpling then turned his broad back on the poultry-yard to cross the field in the direction of the willow.

Now the doctor's garden was separated from the field by a terrace, with a broad flight of steps leading up and down. On this terrace the Doctor and his sister would often take a stroll for the benefit of their health. It so happened that they appeared upon the scene just as the Dumpling's stout form was crossing the field. There was nothing suspicious in his progress, but something very unusual soon attracted the Doctor's attention.

"Look, Rachel, at that strange fowl! Whatever can it be up to? It must have gone mad! Did you ever see a more extraordinary performance?"

It was indeed strange! There was the Cochin China hen, with outstretched neck and ruffled plumage, proceeding rapidly across the field, tumbling at times, then revolving like a spoon-bait; scuffling and flapping, and uttering shrill cries of alarm and distress.

Miss Porchester put up her glasses as she lowered her topsail—a blue parasol.

"Why, John, the bird must be bewitched! I will go at once and see Mrs. Carey about it."

The lady marched off to the cottage.

The Doctor, in his broad-brimmed hat, stood, with spectacled nose and hands behind him, gazing at this infatuated fowl, and the more he gazed the more astonished did he become.

The bird had now disappeared behind the willow-tree. It was curious that, with all his experience of boys and their vagaries, the Doctor did not suspect the Dumpling of any complicity in the bird's eccentric movements. It never occurred to him to imagine such a coincidence. He had been a zealous fisherman in his

younger days, and loved dearly to cast a fly upon the dimpling stickles of a fair-flowing stream. Often had he played a fine trout, and exulted in landing it after a difficult contest. But the notion of playing a Cochin China hen with a kite-line had never entered his head, and the idea was altogether so incongruous that the learned man might be excused for failing to entertain it.

So the Doctor turned aside to saunter beneath the trees until his sister returned.

She was absent about ten minutes, for Mother Carey was of a talkative disposition, and made the most of every opportunity for gossip. It was not often that she got the chance of conversation with Miss Porchester: she therefore improved the occasion, and gave that lady a history of the fortunes of her hen-yard during the last few months. She dilated upon the deceitfulness of that hen. Beyond doubt, the bird had for some time past been ailing with softening of the brain, which had developed that tendency to fraud, and had at last culminated in pronounced mania.

"There can't be no shadow of doubt of it, ma'am. The bird's gone stark staring mad. When I lived at the farm years ago, before I married John, we had a sheep took in the same way. And you never, how the poor beast behaved! If he wanted to walk across this room, say, he'd turn over on his back and kick, and get up and tumble forward, and roll and writhe until it made one cry to watch the innocent creature's struggles. And at last father had him killed, and wouldn't let no one eat him, but just buried him in the orchard out of harm's way. And that's what it is with the hen. I knew there was something wrong, for I never see a fowl practise such deceit, as I says to Mrs. Woostford when she come in and says to me, says she, 'Mrs. Carey, why don't you watch that fowl?' and I said, 'I'd scorn the haction, ma'am!' Them's the words I used, Miss, as I might be standing here, and as you might be she, and I had the mop in my hand, and—"

Miss Porchester might have stood there till now, with no prospect of the dame's concluding her speech; but the lady was fain to stem the torrent of words, and so she interrupted it with the remark, "Ah, yes! Well, I suppose it is so. But you had better go and look after the bird, and perhaps you ought to kill it. Good afternoon."

So soon as she was gone Mother Carey put on her bonnet and went out to reconnoitre. She could trace the fowl's progress over the dewy grass, and followed it to the willow-tree. But there the tracks ceased. There were only the marks of a boy's footsteps, and Mother Carey could in no wise connect the fowl's vagaries with any boy.

She therefore returned baffled a second time in her attempt to solve the mystery of her bird's behaviour, in much the same frame of mind as she was when first introduced to the reader. Furthermore, the damp grass had produced an irritability in the corn on her big toe.

Where was the hen meanwhile?

She was still alive, and that is saying a good deal, for the toils of inexorable fate were closing around her: and her life had hung by a thread, not to say a twine cord, before ever we have reached this point in the narrative.

For it must be stated that the Dumpling had left no stone unturned to explain the cause of his failure in the trifle. He had ransacked his brains to find some satisfactory clue to the mystery. He only wished he had tasted the ingredients before using them. After all the bragging about his skill in the art of cookery, to be thus degraded beyond all recovery in the eyes of his admirers! Oh, if he could only find out how the trifle had proved such an abomination! It could not have been the buns or the brandy; the beer could not have made such a difference; the jam was Crosse and Blackwell's; it must have been the eggs! Of course! Why hadn't he thought of it before? One of the eggs must have been ADDLED! That explained it all.

Thus pondered the Dumpling, and as the idea flashed upon his mind he brought down his club with a sounding "thwack" upon the paling of the hen-yard, sending the whole flock into a stampede.

"Hang the old hen!" quoth he. "I'll teach her to lay addled eggs!"

And then his brain, so subtle in devising mischief, suggested that quaint stratagem to capture the offending fowl. On reaching the shelter of the willow he had drawn in the line. He had clutched and pinioned the feathered biped. He had fitted a noose of twine round her neck; he had passed the twine over a branch of the tree. He was on the point of exacting lynch law, when a glance at the terrace had revealed the Doctor standing with intent gaze directed towards the spot. Vengeance must be delayed for the present.

Disconnecting the halter, severing the twine that protruded from the bird's beak, tying his handkerchief round her head, the Dumpling had hustled the hen under his jacket. He had watched till the Doctor left the terrace, and then he had ambled off at his best pace to the wood-yard, and hidden the gagged fowl in the old tea-chest, to await execution at a more convenient time.

Sad indeed was the position of the unhappy bird. With legs tied fast and wings compressed by durance vile, with head, as it were, in a bag, she lay bewildered in darkness; and if a hen is capable of thought, truly her meditations must have been full of dismal forebodings. By dint of extreme exertion she was, however, able to move her beak and inflate her lungs to a certain extent, by which means she managed to squeeze out a few

disjointed sepulchral squeaks. Her powers increased by practice, and when John Carey passed through the yard on his way to the boot-house he paused as the faint cries of distress fell on his ear.

Deliverance from that cruel bondage was the prompt result. The fetters were loosed, the handkerchief removed, and, after a shake or two, the old hen trotted after her liberator back to Mother Carey's yard, little the worse for her adventure, save that a sensation akin to violent indigestion probably agitated her intestinal regions.

John Carey showed more intelligence than the wiser heads in interpreting the matter. He waited till school was over, and then waylaid the Doctor, to whom he communicated a detailed account of what he had witnessed the evening

before, and gave it as his conviction that Master Bertram had treated the fowl with cruelty and insult.

The Dumpling was sent for, and received a long and impressive lecture from the Doctor and a portentous imposition in the shape of twenty propositions of Euclid, to be learnt and repeated within a week, under penalty of chastisement by default. He was also forbidden to enter the field without a master.

There is reason to believe that the fraternity of the Jolly Guzzlers enjoyed, like the fabled butterfly, but an ephemeral existence, and that the Dumpling did not again attempt to gain influence over his companions at Highfield House by any performances in the art of confectionery.

(THE END.)

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER III.—A LITTLE SCIENCE.

TO his honour be it said, the young engineer had not come to Griqualand to spend his time in an atmosphere of

graphical and geological surveys of certain parts of the country, to collect specimens of the rocks and diamantiferous

Dada.

greed, drunkenness, and tobacco smoke. His object was to make sundry topographical analyses on the spot. His first care,

therefore, was to procure a quiet dwelling-place, where he could set up his laboratory, and which would serve as the centre of his explorations in the mining districts.

The knoll on which Watkins Farm was situated soon attracted his attention as a site particularly favourable for his work, far enough away to suffer but little from the noisy proximity of the camp, and at

yarns of Mr. Watkins. Besides, he smoked very little, and drank much less; and take him altogether he was hardly the jolly companion that the farmer had anticipated.

Nevertheless, Cyprien was so straightforward and considerate, so simple in his manner and speech, so well informed and so modest, that it was impossible to meet him frequently without liking him. And

Cyprien at work.

the same time within an hour's walk of the farthest kopjes, for the diamond field is not more than ten miles in circumference. And so it happened that in the course of a single afternoon he had selected one of the houses abandoned by Mr. Watkins, agreed to take it, and installed himself therein. The farmer was most agreeable. At heart he was thoroughly tired of being alone, and highly pleased to find a young man anxious to take up his quarters close by, and break into the wearisome monotony.

But if Mr. Watkins expected to find in his tenant a mere table companion or a partner in his assaults on the gin bottle, he was very much mistaken. Almost before he had taken up his quarters with his retorts, furnaces, and reagents, almost before the chief articles of his laboratory had arrived, he was out on his geological excursions. Coming home in the evening nearly knocked up with fatigue, with rock specimens in his vasculum, in his satchel, in his pockets, and even in his hat, he had much more inclination to go to sleep than to listen to the sub-fossil

Mr. Watkins soon held him in more respect than any other man he knew.

"If he only knew how to drink! But what are you to do with a man who will not touch the least drop of gin?"

Thus did the farmer conclude his frequent disquisition on his tenant's merits.

Miss Watkins, for her part, found herself suddenly placed on a footing of unrestrained friendship with the young scientist. Finding in him a distinction of manner, an intellectual superiority which she had hardly met with before in her usual circle, she had taken advantage of the unexpected opportunity to complete experimentally the varied chemical knowledge she had obtained by reading scientific works.

The young engineer's laboratory, with its strange-looking apparatus, interested her greatly. She was above all things anxious to learn what she could about the nature of the diamond, that precious stone which played so important a part in the conversation and commerce of the country. In fact Alice had almost come

to look upon the gem as a worthless pebble. Cyprien, she could not but see, held much the same opinion on the subject as she did, and this community of sentiment had had no little influence on the friendship which speedily grew up between them. We may say without fear of contradiction that these two were alone in Griqualand in thinking that the sole object of life did *not* consist in finding, cutting, and selling the little stones so keenly coveted among the nations of the earth.

"The diamond," said Cyprien to her on one occasion, "is only pure carbon. It is a fragment of crystallised coal; nothing more. You can burn it like a lump of coke, and it was its property of combustion that first led to the knowledge of its real nature. Newton, who observed so many things, noticed that the diamond refracted light more than any other transparent body; and as he knew that this property belonged to most combustibles, he, with his usual boldness, deduced from the fact the conclusion that the diamond ought to be combustible. And experience proved that he was right."

"But, Mr. Cyprien, if the diamond is only carbon, why does it fetch such a price?" asked Alice.

"Because of its rarity," answered Cyprien, "and because it has only as yet been found in small quantities. For a long time it came only from India, Brazil, and Borneo. And surely you can remember, when you were about seven or eight years old, how it was first discovered in South Africa."

"Oh, yes! I remember!" said Miss Watkins. "Everybody seemed to go mad in Griqualand! There was nothing to be seen but people with pickaxes and shovels prospecting all over the place, changing the courses of the streams to examine their beds, and dreaming and speaking of nothing but diamonds. Young as I was, I can assure you that I was quite weary of it at times. But you say that the diamond is dear because it is rare. Is that its only merit?"

"Not entirely. Its transparency, its brilliancy when it has been cut so as to refract the light, even the difficulty of this cutting, and its extreme hardness, make it a very interesting body for the scientist, and, I should add, very useful in the arts. You know it can only be polished with its own dust, and that it is its peculiar hardness which has caused it to be used for many years for rock-boring purposes. Without its help not only would it be very difficult to work in glass and other hard substances, but the boring of tunnels, mine-galleries, and deep wells would be much more difficult."

"I understand now," said Alice, who began to have a slight respect for the poor diamonds she had hitherto so despised. "But, Mr. Cyprien, this carbon of which you say the diamond is composed in a crystalline state—that is right, isn't it?—this carbon, what is it?"

"A simple body, not a metal, and one of the most widely-distributed bodies in nature," answered Cyprien. "All organic matter without exception possesses it. Wood, meat, bread, vegetables, etc., all have it among their constituents!"

"How strange!" said Miss Watkins. "To think that those bushes, the grass, the tree, the flesh of my ostrich Dada, and my own, and yours, Mr. Cyprien, are all partly made of carbon—like dia-

monds! Is everything carbon in this world?"

"Well, some people have been suspecting something of the sort for a considerable time. And contemporary science is making rapid advances towards some such solution. That is to say, the tendency is to reduce the number of simple bodies and prove many of the old elements to be mere compounds. The spectroscope has lately thrown quite a new light on chemistry, and the sixty-two substances classed hitherto as elements would seem to be but forms of one—hydrogen perhaps—under different electric, dynamic, and calorific forms."

"Oh! you frighten me, Mr. Cyprien, with your long words," said Miss Watkins. "Let us only talk about carbon. Why do not you chemists crystallise it as you did the sulphur in those pretty needles the other day? It would be so much more convenient, surely, than having to dig among the rocks to find it."

"People have often tried to do so," replied Cyprien, "and attempted the manufacture of diamonds by the crystallisation of pure carbon, and to a certain extent have succeeded. Despretz in 1883, and quite recently in England another experimenter, have produced diamond dust by employing a strong electric current in vacuo to act on carbon cylinders free from mineral substances and prepared with sugar-candy. But up to the present the problem has not met with solution that would bring it into trade. Notwithstanding, it may be only a question of time. Any day, perhaps at this very moment, the method of making diamonds may be discovered."

It was thus they talked as they strolled along the sandy terrace which extended by the farm, or, seated under the verandah, watched the stars twinkling in the southern sky.

Sometimes Alice would leave the engineer and return to the house, at others she would take him to visit her flock of ostriches, kept in an enclosure at the foot of the knoll on which Watkins Farm was situated. Their small white heads craning over their black bodies, and the bunches of yellowish feathers ornamenting their wings and tails, interested the young lady, who for a year or more had kept quite a poultry-yard full of the giants.

Ostriches are very seldom tamed, and the Cape farmers leave them in a half wild state, parked in an enclosure of vast extent, surrounded by wire fencing like that in many countries running alongside the railroad. There they live all the year round in a captivity they know not of, feeding on what they can find, and seeking quiet corners wherein to deposit their eggs, which very strict laws protect against marauders. It is only at moulting time, when they throw off the feathers so much in request by the ladies of Europe, that the beaters drive them into a series of enclosures, diminishing in size, until the birds can be easily seized and made to give up their plumage.

This industry has been thriving at the Cape for many years. Every ostrich reduced to slavery brings to his proprietor without further expense a revenue of from eight to twelve pounds, nothing very extraordinary when it is remembered that a large feather of good quality will fetch from two to three pounds, and that even the medium and smallest feathers are of considerable value.

But it was only for her private amusement that Miss Watkins had made pets of a dozen of these huge birds. It pleased her to see them with their eggs, and come up with their chickens to be fed as if they were fowls or turkeys. Cyprien often accompanied her to the ostrich yard, and amused himself by stroking the best-looking of the lot, a certain black-headed ostrich with golden eyes—that very Dada who had swallowed the ivory ball which Alice used for darning on.

Little by little there had grown up in Cyprien a feeling of much depth and tenderness towards the young lady. He had persuaded himself that never would he find a companion more simple-hearted, more intelligent, more amiable, or more accomplished in every way to share his life of labour and meditation. In fact, Miss Watkins, having lost her mother very early, had been obliged to take charge of her father's house, and was an accomplished housewife, at the same time as a true woman of the world. It was this curious mixture of perfect refinement and attractive simplicity that made her so charming. Having none of the silly scruples of so many of the young ladies of Europe, she was never afraid of soiling her white hands in the paste for the pudding, or of superintending the dinner, or keeping the linen in proper repair. And all this did not hinder her from playing Beethoven's sonatas as well as, and perhaps better, than most people, from speaking two or three languages, from taking pleasure in reading, from appreciating the masterpieces in literature, and finally from being eminently successful at the little weekly assemblies among the rich farmers of the district.

And ladies of high education were not so few as at first might be supposed. In the Transvaal, as in America and Australia, and in all new countries where the hard work of civilisation falls on the men, intellectual culture is almost the exclusive monopoly of the women, and it frequently is the case that in general knowledge and artistic refinement they are the superiors of their husbands and sons. It has happened to many a traveller to discover, not without surprise, in a wife of an Australian squatter or a miner of the Far West, a musical talent of high order associated with profound literary and scientific knowledge. In the Orange Free State, where the education of the girls has for years been the same as that of the boys, and where the girls stay longest at school, this contrast is everywhere most marked. The man is the breadwinner, and, as his share, takes the toil and danger incident to a life in the open air; the woman takes the domestic cares and cultivates the arts and letters, which her husband despises or neglects.

And sometimes a flower of beauty blossoms in the desert, as in this case of Farmer Watkins's daughter.

Cyprien had said all this to himself, and, as he always went straight to the mark, he had no hesitation in making his request.

Alas! great was the fall in his hopes. For the first time he saw the almost impassable gulf which separated him from Alice, and heavy was his heart as he returned from the decisive interview. But he was not the man to give up to despair. He was resolved to fight his way in the world, and in his work he had a sure solace for his grief.

Taking his seat at the small table, he finished, in a quick firm hand, the long confidential letter which he had begun in the morning to his revered master, Mr. J—, member of the Academy of Sciences, and titular professor at the School of Mines.

"One thing," he wrote, "I thought better not to put in my official memoir, because it is as yet only a hypothesis, and that is, the opinion I have been led by my geological researches to entertain on the subject of the diamond's formation. Neither the hypothesis that assumes it to be of volcanic origin nor that which attributes its appearance in the beds to violent disturbances satisfies me any more than it does you, my dear master, and I need not repeat the reasons which led us to abandon it. The formation of the diamond in situ by the action of fire is likewise too vague an explanation to satisfy me. What was the nature of this fire? and why did it not affect the limestones of all kinds which are invariably met with in diamantiferous deposits? The idea seems to me quite childish, and on a par with the theories of the vortices and hooked atoms."

"The only explanation which satisfies me, if not entirely, at least in a certain degree, is that of the transportation by water of the gem's elements and the subsequent formation of the crystal in position. I have been much struck with the peculiar outline, almost identical in all cases, of the different beds which I have noted and measured with great care. All more or less are in the general form of a basin, or rather, considering the shape of the overlying strata, that of a hunting-flask on its side. This appears to have been a reservoir of from thirty to forty thousand cubic yards in extent, in which there has been a deposit of sandy conglomerate, of mud, and of alluvial earth laid down on the older rocks. This character is very marked at Vander-gaart Kopje, one of the most recently discovered of the diggings, and which belongs, by the way, to the owner of the house in which I am writing."

"When a liquid containing bodies in suspension is poured into a cup, what happens? The bodies arrange themselves at the bottom of the cup or round its sides. That is exactly what has happened in this kopje. It is at the bottom and in the centre of the basin as well as round the outer edges that the diamonds are met with. And this is so well understood that the claims between rapidly fall to a lower value, while the central concessions or those bordering on the boundary enormously increase as soon as the shape of the deposit is made out."

"Besides, several circumstances that you find mentioned in my memoir tend to show the formation of the crystal in position rather than its transport thither in a perfect state. To mention only two or three, diamonds are nearly always found in groups of the same kind and colour, which would hardly be the case had they been formed afar and brought thither by a torrent. Frequently two are found together, united but detachable at the least blow. How could they have resisted the grinding and jarring if brought down by water? Again, the larger diamonds are always found under the shelter of a rock, which seems to show that the influence of the rock—its radiation is heat, if nothing else—has helped on the crystallisation."

It is rare—very rare—that large and small diamonds are found together. Whenever a large specimen is discovered it is almost always isolated. It is as if all the adamantine elements in the depression had been concentrated into a single crystal under the influence of special causes.

"These and many other reasons urge me to think that the diamond is formed in position, and that the elements of crystallisation were brought down to the spot by water.

"But whence came the waters which bore down the organic detritus destined to be formed into diamonds? This I

have not yet been able to determine in spite of my careful study of the district.

"The determination, however, may prove of some value. If we can find the route taken by the streams, why should we not in tracing it up arrive at the starting-point whence came the diamonds? and there we should doubtless find them in large numbers compared to that in the beds at present worked. It would be a complete demonstration of my theory, and one that I should be very glad to make. But it will not be my lot to do so, as I have nearly completed the period for which I was sent out. I have been more successful in my analysis of

the rocks—" and the young engineer, continuing his story, plunged into technical details, which, though doubtless of much interest to himself and his correspondent, are hardly likely to please the uninitiated reader.

As soon as he had finished his long letter, Cyprien extinguished his lamp, stretched himself in his hammock, and slept the sleep of the just.

Work had driven out grief—at least, for an hour or so—but a pleasing vision haunted the young student's dream, and seemed to whisper that there yet was hope.

(To be continued.)

OUR CRICKETING GUESTS.

(Continued from page 35.)

ONE of the most noticeable events of the Australian tour was the match with the M.C.C. and Ground, when the club score showed three individual amounts of over a hundred—those of Messrs. W. G. Grace, A. G. Steele, and Barnes—one of 72, that of Mr. T. C. O'Brien, and, reaching the large total of 481, proved able to win the match by an innings and 105 runs, and satisfactorily wipe out the memory of their fluky defeat in 1878. The curious one-day match at Birmingham, in which such small scores were made, was also of some interest as being an almost exact reproduction of the famous M.C.C. encounter of six years ago. Following the Aston Park meeting came the expected defeats of Derbyshire and Lancashire, and the well-fought contests with Yorkshire and Notts, each won by three wickets—results, particularly in the latter case, due to exceptional good fortune. The decisive victory over Cambridge was balanced by the equally decisive defeat by the North; and then came the Liverpool match, in which fortune certainly did not smile upon the visitors, and in which the resistance, as later on at Huddersfield, was out of all proportion to the paper strength of the team. The return match with the Gentlemen at the Oval was distinguished by the collapse of the English tail and the really fine play of the Australians; that against the so-called Players of England—with Notts standing out—by Spofforth's great feat of capturing thirteen wickets for 123 runs. The Huddersfield mystery followed, and then came the first meeting between England and Australia in the swamp at Manchester. Leicestershire and Middlesex proved easy victims to their visitors, and then came the great match of the tour—the only played-out encounter between England and Australia—in which the Australians, with everything in

their favour, were easily defeated. After only just escaping an unexpected beating at the hands of Sussex, the team returned to London to triumph over a very weak eleven of Players at the Oval, and they then started for Canterbury, to experience a surprise in the shape of a defeat from the men of Kent. The Clifton fixture with Gloucestershire followed, and, the weather being perfect, the scoring proved too heavy to allow the match being played out, the same fate awaiting the England match at the Oval, in which Murdoch made 211, McDonnell 103, and Scott 102, and the total reached 551, the second highest score obtained by the Australian team in England. In this match every member of the England eleven was tried as a bowler, and one man—Dr. W. G. Grace—filled in succession every place in the field. The last wickets fell with the Hon. Alfred Lyttelton bowling and the champion keeping wicket! In the first innings of England there occurred, to the surprise of both fielders and spectators, that very rare event in a first-class match, a palpable error on the part of an umpire in a "run out" decision. The next match was against Gloucestershire at Cheltenham, and the western county were decisively beaten; and then came the second Nottingham encounter, luckily drawn by the Australians when going heavily against them. Cambridge University were then met and duly triumphed over; then a team hardly worthy of the name of the South of England were beaten at Gravesend, then the North of England gained another victory at Nottingham; then followed the usual foregone conclusion with the Zingari, and then, with a decisive defeat of a very poor eleven of Southerners at the Oval, the long season terminated—a season carried out throughout with wonderful pluck and endurance, and one that will not soon be forgotten in cricket history.

In another sphere the visit of the Philadelphians was even more successful than that of the Australians, and promises to be at least as productive of good for the game. The programme arranged for the Americans by the secretary of the M.C.C. was not a very ambitious one, but it was got through with singular smoothness, and the record of eight wins, four losses, and five draws is a sufficient proof of the accuracy with which he gauged the form of the visitors. The round began on June 2nd with the drawn match against Dublin University; then followed the defeat of the Irish Gentlemen by six wickets. Edinburgh was then visited, and the Scottish Gentlemen gained a five-wickets victory; a draw followed at Scarborough, and then came the trial match with the M.C.C. at Lord's, when owing to an accident the team were not seen at their full strength and were easily defeated. The "Cheshire Gentlemen" were then defeated at Stockport, the "Leicestershire Gentlemen" at Leicester, and the

"Gloucestershire Gentlemen" at Cheltenham after the "Hampshire Gentlemen" had scored successfully at Southampton. A draw followed against the Lansdown Club and a win against the Castleton at Rochdale. The "Gentlemen of Liverpool" were then defeated by 4 runs, the "Gentlemen of Northumberland" by 96 runs, and the "Gentlemen of Derbyshire" drawn against. The Americans then beat the "Gentlemen of Surrey," and were beaten by the "Gentlemen of Sussex" and the "Gentlemen of Kent," and with the drawn match against the Services at Portsmouth the visit terminated.

Four centuries were made during its continuance—two by W. P. Stoever, one at Stockport, one at Scarborough; one was made by W. Brockie at Scarborough; another, the highest of the tour, by the captain, R. S. Newhall, against the Gentlemen of Cheshire.

The general batting average of the team was 18, the general bowling average 21. We append the detailed return:—

Some of the results of these two visits are already apparent. An invitation has arrived for a gentlemen team to visit America, and a team of thirteen professionals, consisting of Shaw, Shrewsbury, Barnes, Flowers, Scotton, and Attewell of Notts, Ulyett, Bates, Hunter and Peel of Yorkshire, Briggs of Lancashire, Read of Surrey, and James Lillywhite of Sussex, are now on the seas on the Orient on their way to Australia, and are due at Adelaide on the 1st of November.

WHEN autumn tints the trees with gold
And leaves fall fluttering from above,
When noons are warm and midnights cold,
And shortened days show summer's done,

Then is the time to seek the fields
Where late the heaped-up sheaves were seen,
The stubbly land still kindly yields
An aftermath to those who glean.

Dame Nature now fulfils the pledge
She gave the world when yet 'twas Spring;
See where on every bush and hedge
The berries on their slim stalks swing.

Nor will your search for nuts be vain—
Why, then, return to smoky town?
Though summer days are on the wane,
Wait till the leaves have all dropped down.

GREAT AFRICAN EXPLORERS

BURTON, SPEKE, AND GRANT.

Captain J. H. Speke.

WITH Du Chaillu we bid farewell for a time to the west coast of Africa, and betake us to the east, where, in 1854, Captain Burton made his famous journey to Harar. Few more daring things have been done by this extraordinary man than the dash into Somali Land with which he began his African career. Somali Land stretches along that strip of coast between Abyssinia and Cape Guardafui, facing Aden and looking to the north; and at Zeyla, in the western corner, Burton landed on 29th November.

Harar—the ancient metropolis of a once mighty race, the only permanent settlement in Eastern Africa, the renowned seat of Moslem learning, a walled city of stone houses, possessing its independent chief, its peculiar population, its unknown language, and its own coinage, the emporium of the coffee trade, the headquarters of slavery, and the birthplace of the Kat-plant (*Catha edulis*), the chewing of which gives so many of the Arabs their hilarity and wakefulness—was his goal. Captain J. H. Speke, of Victoria fame, who had been collecting in Thibet, was associated with him in this exploring enterprise, and devoted his attention to the Wady Nogal. Burton's description of his march is, of course, splendid reading. At Gudnigaras he came up with a whole tribe on the move. It consisted of a hundred and fifty spearmen with their wives and children. With them went two hundred cows, seven hundred camels, and eleven or twelve thousand sheep and goats. The sick were carried on the camels with their legs sticking out from the hide coverings, and the household goods were packed on dromedaries, and led along by young girls followed by the mothers carrying the babies, and helped in doing so by the little ones.

With this party he travelled for a short time, and then "the old man who knows knowledge," as the women called him—he can speak nine-and-twenty languages—struck off for Harar through the tangled aloes, ragged thorn, and prim-looking poison-trees, the "wabas," from which the Somali poison their darts and arrows. He made his way up the Halimalah valley, whose surface glistens with flakes of mica and pebbles of quartz, and where grow the thorny jujube-tree with whose burning branches the women smoke their hair, and the still more spiky kedi, whose thorns yield the Bedouins their hatchet-handles. He crossed the Marai plateau, where he found the villagers keep-

ing harvest-home, and at last came in sight of the three grey minarets of Harar—the Timbuctoo, or Timbuktu as it is now the fashion to spell it, of the East. His interview with the Amir has its parallel with that of Vambéry with the Khan of Samarkand, the danger in each case in penetrating into a stronghold of Mohammedan fanaticism being enormous. Burton, however, notwithstanding that he heard the people in the streets whispering that he had been ordered to be killed, escaped unscathed, as he did from Mecca in 1853, where, disguised as a Moslem, he made his dangerous pilgrimage to the Kaaba.

Leaving Harar, which is a city of great age—having been founded in the seventh century by the Arab invaders who built up the Zeyla empire—and inhabited by a distinct race of its own, who speak a tongue unintelligible to all but its citizens, he journeyed back to the coast, to Kurayat and on to Aden. The next year, in company with Speke, who had been unsuccessful up the Nogal, and two other officers, he returned to Berberah. Here, at three o'clock in the morning of the 9th of April, the Somali broke into the camp, murdered Lieutenant Stroyan in cold blood, and attacked the other three. In the gloom of the morning a terrible fight took place. Burton was armed with a sabre only, and with this he cut down his assailants, while Speke and Herne fought one on each side of him. Together the three forced their way with safety, though Speke was felled by a blow on the chest, and escaped only after being speared several times, once clean through his right leg.

And now begins the most famous chapter in African exploration—the discovery of the great lakes. Livingstone, in 1849, had discovered Ngami, a narrow sheet about fifty miles long and of little importance in the physical geography. About seven years afterwards one of the German missionaries had from the slopes of Kilimanjaro caught sight of a large sheet of water to the west. This was the first ascent of the great African mountain to solve whose mystery Mr. H. H. Johnston, of Congo fame, has now set out. Kilimanjaro rises to nearly twenty thousand feet, and forms the highest peak in equatorial Africa, though Kenia and the almost mythic Doenyo Ngai may nearly equal it.

To explore this inland sea reported by the missionary, Captain Burton, who had been through the Crimean War as chief of the

staff to General Beaumont, started in 1857. His second in command was Captain Speke. Reaching Zanzibar, and finding the season then unsuitable for a journey into the interior, they occupied themselves for some time in exploring the adjacent coast districts. In June they started, and of course this, the first organised exploring expedition from Zanzibar, met with immense difficulties. They made their way over the mountains to Ugogo, and entered the Land of the Moon at Razeh.

Burton was stricken with the palsy, Speke with ophthalmia; but still they pressed on, determined to reach the mysterious water of which rumours confirmed the existence. At last, on 13th February, 1858, from rising ground the natives showed them—or rather him, for Speke could not see—a silver streak in the distance, and told them it was the long-sought lake. Writes Captain Burton:

"I gazed in dismay; the remains of my blindness, the veil of trees, and a broad ray of sunshine illuminating but one reach of the lake, had shrunk its fair proportions; but advancing a few yards the whole scene burst upon my view, filling me with admiration, wonder, and delight. Nothing in sooth could be more picturesque than this first view of Tanganyika Lake as it lay in the lap of the hills in the gorgeous tropical sunshine, its clear waters gleaming against a background of steel-coloured mountains."

As long as from Aberdeen to Dover, and thirty miles across, the dimensions of the lake exceeded all their anticipations. Soon they reached Ujiji, the first Europeans to enter that now well-known town, and then they endeavoured to get afloat on the inland sea. The native chiefs, however, were anything but willing to oblige them. Speke crossed to Ukaranga to buy a boat for exploring purposes, but his mission was in vain. At last they procured two crazy canoes, and in them, on 10th April, they embarked and sailed to Uvira, visiting every bay in search of the outlet of the Nile, whose headwater they then supposed the lake to be.

They found no trace of the Nile, and began their return journey to Razeh, whence, while Burton remained to arrange his notes, Speke was sent northwards in search of another large inland sea of which they had heard. Speke hurried on, and on 30th July, 1858, caught a glimpse of an estuary, and four days afterwards, ascending a hill just after dawn, found gleaming before him, with its surface just tinged by the rising sun, that vast sheet of water we now know as the Victoria Nyanza, a worthy rival to Superior, with a bosom large enough for all Scotland to float in. Speke returned to Burton with the news, and the travellers, finding it impossible to thoroughly explore the new lake in their crippled condition, and not feeling quite satisfied of its importance in the Nile problem, struck their camp and made for home.

Speke was soon back on the old track, but Burton, having been appointed consul at Fernando Po, set to work on the west coast. He explored all the way from the Gambia to Saint Paul de Loanda, he penetrated to Abeokuta, ascended the Camaroons, made his way to Benin city, found the cannibal Fans of Du Chaillu, and identified them as the Mpangwe, went up the Congo to the falls of Yellala, surveyed the Elephant Mountains and the whole line of lagoons between Lagos and the Volta, and wound up with a three months' mission to King Yelele in the endeavour to persuade that barbarous monarch of Dahomey to modify the sanguinary customs of his race.

Speke's expedition was to survey the Victoria Lake, and to prove his contention that it was the true headwater of the Nile. With him, as second in command, went Captain (now Colonel) J. A. Grant. The explorers made their way out to Mozambique, and left there in the Brisk for Zanzibar. The very next day a slave was sighted, and an exciting

chase ensued. The slaver was captured. She proved to be the Sunny South, alias the Manuela, and out of her was taken the nice little cargo of five hundred and forty-four slaves.

The chronicle of the expedition is somewhat monotonous. Nothing of much excitement occurred, the struggle throughout was one against wearisome delay and disheartening greed. The various monarchs through whose territories the explorers passed vied with each other in their extortions. Kazeh was the first point to which they made, and again Speke found himself in that strip of fertility between the fives where grow all the necessities of life, and which everywhere throughout the world is bounded by the desert band that shuts off the torrid from the temperate zones.

They reached the borders of the lake, and met the first king at all worthy of the name in Rumanika, the Monarch of Karague. While they were with him he behaved like a courteous gentleman, was quite satisfied

with the presents offered, and even checked one of his ministers when he hinted that he should so like a gun. His majesty was delighted at a Jumping Jack Captain Grant made for his children, and wished to have one life-size. When pressed for a list of the presents he would like in the future, he gave them in the following order: an American clock with a face like a man's to roll its eyes at every beat of the pendulum, a Jack-in-the-box, a milk-pot, a carriage and horses, and a railway!

At Rumanika's court Christmas, 1861, was spent, and in February, 1862, the expedition reached King Mtesa at Uganda. Here a long stay was made. Speke taught the king to shoot, and rose in high favour; and it was only by explaining the advantages of opening out the northern road for trade that he was suffered to depart from that well-governed kingdom—for, for an African kingdom, Uganda is really kept in excellent order.

To coast along the lake, and so find the Nile's outlet, was not permitted them, and

the explorers had to be content with marching parallel with the shore, and being brought round to view from below the Ripon falls, where the river issues. Following the river for a short distance, they struck off from the bend, making their way with much difficulty through Kamrasi's country, passed in latitude 3½ the tree marked with the name of Miami (the Venetian who till then had been farthest up the Nile, and claimed that he had cut his name in latitude 2), reached Gondokoro, and rushed into the arms of Samuel Baker, who was on his way to the south in search of them.

Fully satisfied that they had discovered the headwater of the Nile, they reached home. It was left to Baker to show that the solution was not so simple as they had imagined, and that by leaving the river at the bend they had missed one of the chief features in the mystery, and left unseen another lake with an area of over six thousand square miles, of which their river was the feeder.

STRANGER THAN FICTION;

OR, STORIES OF MISSIONARY HEROISM AND PERIL.

THE BISHOP OF THE ANTIPODES.

Bishop Selwyn.

CHIEF among missionaries in the permanent success which attended his labours ranks Bishop Selwyn, of New Zealand and Lichfield. A man of many gifts, of boundless energy, and brilliant accomplishments, he is amongst the most conspicuous servants of the Gospel in these modern days. From boyhood to old age Selwyn's character was the same; everything that came to his hand he could do, and do right well. His flock considered he was a born missionary; his clergy spoke of him as a pattern bishop; the soldiers held that he would make a first-rate general, and the sailors—well, the opinion of the sailors is best expressed by the saying of an old sea captain—"It is enough to make a man a Christian to see the bishop handle a craft!"

He was born at Hampstead in 1809, the son of Selwyn, the famous lawyer, who was the law tutor of the late Prince Consort. He was one of three brothers, all of whom rose to eminence—one became Lady Margaret Professor of Divinity, another Member of Parliament for his University and Lord Justice of Appeal, and the other, George Augustus, was the subject of this sketch.

After a short stay at a private school he was sent to Eton, where he boarded in the same house with Mr. Gladstone. He had a

most distinguished career. Clever, handsome, and athletic, he carried all before him, and out of school and in school won golden opinions. In boating, swimming, and cricketing he had no superior, and his influence was always used for good. Among the boys of his division of the school he effectually put down profane language, and in many other ways did much for his fellows. He left Eton for Oxford, and his success at work and play went with him. He rowed in the first University Boatrace—that at Henley, when Oxford won easily. In one of his letters, in speaking of this contest, he says:—"I was in the race of 1829. The great benefit of our rowing was that we were—by rule, if not by inclination—habitually temperate; and I suppose all medical men will agree that little danger can arise from strong exercise in youth if the body is always kept in a fit state. Active exercise, combined with strict and regular habits, had, I think, a most beneficial effect upon the constitution, and certainly enabled Bishop Tyrrell and myself, on horseback and foot in Australia and New Zealand, to make very long journeys without inconvenience. My advice to all young men is, in two sentences—Be temperate in all things, and *Incumbite remis*—bend to your oars."

He came out highest but one in the classical

trips, and after gaining his Fellowship settled at Eton as a private tutor. In a few years' time he was appointed to New Zealand as its first bishop. The see had been offered to his elder brother, the professor, who had declined it, and the offer had come next to him.

He was the very man for the position. He realised at once the nature of the country to which he was going, and prepared accordingly. On his voyage out in the *Tomatin* he made himself master of seamanship and navigation, and obtained a working acquaintance with the Maori language. He began his career as he intended to go on. The *Tomatin* got into Auckland Harbour at midnight; at sunrise the bishop was up and off to land, steering the boat, and the first thing the natives saw of their bishop was his wading through the surf, dragging his own boat to the shore. He called on the Chief Justice; the household was asleep, and so he pushed his card under the door, went for a stroll, and returned for breakfast. On the Sunday a fresh surprise awaited the New Zealanders—the bishop read the prayers in Maori, and preached in the native tongue!

"That's the sort of man we want!" said Captain Hobson, the Governor, and "the sort of man" he really proved to be.

To do any good as a bishop, he saw at once that he must become personally acquainted with those who were in his charge, and so a few days after his arrival he was off on a two-thousand-miles' tour, by sea and land, during which he visited every clergyman and catechist in the colony. After an absence of six months he returned, and before the year was out he was away again.

Of his adventures during these expeditions New Zealand annals are full. No matter what the emergency might be, the bishop was equal to it. When the rivers were flooded and dangerous he swam them with his clothes in a bundle on his back, and his watch and pedometer in a waterproof belt round his waist. As he himself said, he was so much in the water that he was fully qualified to be "Bishop of Bath and Wells!" He could rough it with anybody. On one occasion he was refused admission to a house, and told to take his night's lodging in a pigsty. He cleaned it out, cut his own fern, and lay down to sleep as calmly as if it had been the usual episcopal bedroom. Nothing came amiss to him. He had to be at a certain place at a certain time, and there he was. One of the most famous anecdotes tells how he once returned to Auckland and passed over the site he had chosen for his cathedral with his clothes almost in rags, with his shoes

worn to shreds and tied on to his feet with the leaves of New Zealand flax.

All whom he met felt the charm of his presence; the bishop was always the leader of men that the bishop was expected to be. His "palace" was a cottage built of scoria blocks, and even there he took his share of the roughest settler's work, from cleaning the knives upwards. It is even told how he set to work in his shirt-sleeves and spent a day or so repairing the road. And when the war came he was a nurse and a surgeon as well as a pastor, and carried off the wounded in the thick of the fire.

After seven years of this miscellaneous toil he had reduced his diocese into proper working order, and could devote his attention to the Polynesian Islands, over which a mistake

one of them asked, "What's that schooner that has come in this evening?" to which the other replied, "Oh! that old fool the bishop's." Just then the dingey grounded on the shore, and, rubbing his hands and chuckling, he jumped out of the boat, saying, "Yes, and here's the old fool himself."

One of those who served under him has given the following graphic description of his methods during his eighth voyage:—

"Have you any notion of the way in which he conducts his missionary work? Perhaps you fancy that, like St. Augustine landing at Ramsgate, he marches up chanting Litanies in procession. If he did he would probably be killed before he had gone a hundred yards, for there is no Queen Bertha there to have prepared the men's minds and hearts for the Gospel.

nuts, and after a while swims off to his boat. Next year he will go and call out the names of his old friends, get two or three on board, and induce them to take a trip with him while he goes to the neighbouring islands. So he learns their language enough to tell them what he has come for. He returns and lands his guests, with full instructions to tell the people his objects; and the third voyage he finds plenty ready to come off to New Zealand or any other place where he fixes his headquarters."

It is still told round the camp-fires how, during Cameron's New Zealand War, the bishop every Sunday rode from camp to camp to conduct his eight services, and how the officers used to wait for the smoke of the rifle and the "ping" of the bullet as the crowds

Wellington, New Zealand.

in his patent—giving him an extra sixteen degrees of latitude—had made him supreme. In his twenty-ton schooner, Undine, he started for the Islands in 1848, and in her took a voyage of three thousand miles. In 1849 he had another cruise, and brought back with him five little children, who were the fore-runners of the native clergy of Melanesia; and the same year he went away to Erromango, in company with the Sydney racing yacht Phantom. He was a born seaman, and knew instinctively the humouring that a ship required. One captain of a brig admiringly relates how, on a certain Sunday, when the bishop was on board, his grace noticed in the middle of the service that the vessel was not doing her best on the tack she was on, and, giving the master mariner a look, stopped before the Communion till the men had put her about, and all had hastened aft to resume their attention. Once, at New Caledonia, the schooner ran aground, and the officers of a French man-of-war were astounded to see the Bishop, as no diver was handy, coolly strip to his jersey and trousers and jump overboard to look up what damage had been done. No wonder that when, next day, the bishop dined with them the gallant Frenchmen sent him away with a salute of eleven guns!

During the first ten years of his episcopate he was most unpopular in Wellington, though later on there was no place where he was more highly esteemed. Landing late in the evening in a little dingey, he heard two men on the beach talking about his schooner, and

In due time, may be, he will chant his Litany and Te Deum there. But on first invading the land, or lagoon, he has to make a favourable impression on the people's minds by presents and by letting them see that he has not come to trade. This he does by leaving his boat ten or twenty yards from the reef, where some hundred people are standing and shouting. He then plunges into the water, arranging no end of presents on his back, which he has been showing to their astounded eyes out of the boat. He probably has learnt from some stray canoe or a neighbouring island the name of the chief. He calls out his name; he steps forward; the bishop hands him a tomahawk, and holds out his hand for the chief's bow and arrows. By this Glaucus and Diomedes process he wins golden opinions, at all events. The old chief, with innate chivalry, sends the tomahawk to the rear to show that he is safe, and may place confidence in him. The bishop pats the children on the head, and gives them fish-hooks and red tape, for there is an enormous demand for red tape in these islands. Probably then the bishop has some 'tame elephant' with him—a black boy from some other island—and he has clothed him and taught him to read or the like, and he brings forward this specimen and sample, and tries to make them understand he wants some of their boys to treat in like manner. The bishop gets as many names written down as he can and picks up as many words as he can, establishes a friendly relation, and exchanges calico for yams, perhaps, or cocoa-

of Maori marksmen tried to bring him down while he ran the gauntlet of fire that duty required. With the Maoris, however, he was always popular, and multitudes would follow him when no one else could lead them.

Whether it was preaching to them in their own tongue and guiding them to the Saviour, or calming their excited political passions with a sensible speech ending with

Ka tangi te riroriro,
Kei te ahi au tamariki!

—the native "Lady-bird, lady-bird, fly away home!"—he was always listened to with attention and always won hearts; and when, in 1867, he was called to leave New Zealand, and, in spite of his remonstrances, promoted to the diocese of Lichfield, great was the grief of those he left behind. As was well said at the time—

He has toiled, he has tussled, with nature and savage,
When which was the wilder 'twas hard to decide,
Spite of Maori's musket, and hurricane's ravage,
The tight Southern Cross has still braved time, and tide;

When lawn sleeves and silk apron had turned with a shiver

From the current that roared 'twixt his business and him,

If no boat could be come at, he breasted the river,
And woe to his chaplain who craned at a swim!
Long, long the warm Maori hearts that so loved him
May watch and may wait for his crossing again—
He has sowed the good seed there, his Master has moved him

To his work among savages this side the main.

In the "Black Country," darker than ever New Zealand,
Mid worse ills than heathenism's worst can combine,
He must strive with the savages reared in our free land,
To toil, drink, and die, round the forge and the mine.
And toil he did, and successfully too; but

Lichfield is not as romantic as New Zealand, and, as space is running out, we must leave the record of his doings in his old English diocese to some future occasion. In 1867 he took the see; in 1878 he died.

One of the last phrases spoken during his unconsciousness was, "Who is seeing to that work?" and with that phrase we end our notice of the great bishop of the Antipodes.

ARMOUR IN HISTORY AND ROMANCE.

BY JOHN SACHS.

CHAPTER III.

IN the Old English manuscripts the men all carry spears instead of umbrellas and walking-sticks, as we do. We were then a nation of soldiers, and accordingly a Saxon grave generally contains the spear-head and its ferule, with the staff of ash more or less decayed, and on the other side a small sword, between the legs the remains of a shield, the umbo or central boss, and sometimes an iron cap.

One of these helmets or caps has been found formed of ribs of iron radiating from the crown of the head and covered with narrow plates of horn. On the top of the crown there was represented in iron a pig with bronze eyes.

The early illuminators were splendid ornamental draughtsmen, but poor figure artists, as you can see in our next illustration, which is copied from a Vulgate Bible of the date 1170, and represents David and Goliath. The giant has the helmet with nasal-piece similar to that of William in Fig. 8.

Fig. 9.

David and Goliath.

Our page illustrations are, with one exception, from the Artillery Museum at Paris, formed in 1877. They are selections of restored ancient military costumes mounted on models. Fig. 10 is supposed to be the habit

of a common soldier of the time of Charlemagne. He wears an iron cap with protections for his ears and neck of this metal; his cuirass is composed of plates overlapping, a pattern that has been termed tegulated; his shield, with the umbo or boss, is suspended by a strap to his neck; and his legs are wrapped in woollen bands reaching down to the sandal. The boots of this period were often made of horsehair. Of Charlemagne's staff we have already given a more striking description.

Figs. 11 and 12 are attempts to restore the Norman costumes represented in the Bayeux tapestry and other works of that period. Fig. 12 has the nasal piece attached to the helmet. His byrnie consists of rings of metal sewn on to a leather tunic or hauberk. This garment is lengthy, and is partly divided at the bottom to give freedom of action to the legs. The custom of wearing the shield attached to a guige or strap around the neck was for liberty of action when using the long sword with both hands. The round-topped shield of this period is abundantly represented in the Bayeux tapestry.

Fig. 13 represents a Norman knight with the long kite-shaped shield similar to effigies in the Temple Church, London. Underneath the hauberk can be seen a garment embroidered at the bottom. This is supposed to be the "haqueton," a garment of leather quilted on the inside with wool. The cap is of the shape called Phrygian. The nasal-piece to the helmet disappears about 1150, probably from the convenient hold it gave to the enemy. The fact of King Stephen being made prisoner by a knight who held him by the helmet probably hastened an improvement. Here is the story: King Stephen suddenly attacking the castle of Leicester, then held by the Earl of Gloucester for the Empress Maud. Stephen had sat down before it. The earl endeavoured to surprise him by a rapid movement across the River Trent, which forced the king to a battle. Always ready for deeds of valour, Stephen and his knights attempted to convert the attack into a succession of single combats, but their adversaries threw away their lances and advanced sword in hand. The king was seen dealing death on every side of him with his battle-axe, until at last a stone struck him on the head and he fell to the ground stunned; a knight sprang upon him, seized him by the helmet, and shouted, "Hither! Hither! I have got the king!" a circumstance that decided the fate of the encounter, and for a time the destiny of the monarch.

In the reigns of Henry II., Richard I., and John, sculptured monumental effigies and brasses inlaid in stone slabs valuably illustrate the armour of the times. We find the face unprotected for some years. The chain mail is either drawn over the head, as in Fig. 15, or a sort of helm like an iron pot is used to protect it. Fig. 14 is from the effigy of Geoffrey de Magnaville Earl of Essex, existing at the Temple Church, London. The figure has the curious bucket-shaped helm; he is clothed in mail, over which is a white tunic called "cyclas,"

which was worn over the metal mail to avert the heat or the sun. On the shield is seen an early example of heraldry. On a lozenge diaper are displayed two inverted chevrons, over which is an escarbuncle. The sollerets are "pointed" at the toes; also notice that the spurs have a single prick without rowels, a fashion peculiar to this period. Geoffrey de Magnaville was Hereditary Constable of the

Fig. 14.

Geoffrey de Magnaville, Temple Church.

Tower of London in Henry the Second's reign. He took part against Stephen with Matilda, was taken prisoner and ransomed. For his liberty he gave up the Tower of London and the Castles of Pleshey and Walden in Essex. In acknowledgment of certain endowments he received the habit of the Order of Templars when dying, and this is probably the reason of his effigy being placed in the Temple Church.

Fig. 15 is interesting because it has an actual date. It is from the monumental brass of Sir John d'Auberon, A.D. 1277, at Cobham Church, Surrey. The head is covered with chain-mail connected with the hauberk. Notice the knees are relieved from the strain and grating of chain mail by "genouillères," or plates of steel, which is another transition to plate armour. The figure supports inside his right arm a flag called in Norman-French "Gonfalon," on which is painted a chevron. On the left side is a smaller shield than the kite-shaped one. It assimilates in form to the bottom of a flat-iron. This class of shield is indicated by the name of "heater-shaped." It bears a chevron, and this cognisance is also emblazoned on the small shield above.

Between the reigns of Henry I. and Edward I. a barrel-shaped helmet was used, which covered the head. It had cross insertions for sight and breathing (Figs. 16, 17, and 18). Other garments were used by those who could not afford chain mail. Some were of wamberg or leather quilted with wool; others of haqueton or buckskin fitted with cotton (Fig. 17). These were also worn under the mail by persons of distinction. In the latter case the garments were embroidered at the bottom with ornamental designs in silver and gold. Fig. 18 illustrates the costume of a Knight Templar. The last three examples give varieties of the curious barrel-shaped helmet of the period.

GO-BAN.

(Continued from page 31.)

GAME No. 2.

Between H. F. L. M. (White) and G. W. S. (Black).

WHITE.	BLACK.
1. e 4.	d 5.
2. d 3.	e 4.
3. f 5.	c 2.
4. g 6.	h 7 (i).
5. e 5.	e 6.
6. b 3.	e 3.
7. d 4.	c 3.
8. c 5.	f 4.
9. d 6.	d 2.
10. g 5.	e 7.
11. g 7.	e 2.

The position is now so interesting that we give it on a diagram.

It appears at first sight that White might now place his last man on h 8 and win. Black would then be obliged to place his last man on f 6. White would continue f 5 g 4, and Black must answer h 7 g 8, and White would now win with e 5 f 5, followed by h 8 h 7, if Black could not play e 7 f 7 and come first in making "five" in the diagonal a 2 g 8. To prevent these "five" of Black, White would have to play g 7 f 7 (instead of e 5 f 5), and then Black could win easily by c 3 b 2, followed by e 3 f 2. White therefore must place his last man so that he can at once stop the approaching line of "five" in the second row. He might place it on f 2, but does better to put it on g 3, and thus compel the last black man to go to g 4. Therefore the game went on thus:

12. g 3. g 4.

All the men are now well placed, and the moving can begin.

13. g 7 f 7.	e 3 f 2.
14. b 3 b 2.	f 4 f 3.
15. g 3 g 2.	f 2 g 3.
16. g 5 f 4.	g 3 h 4.
17. g 6 h 5 (j).	g 4 g 5.
18. g 2 g 3 (k).	d 5 c 6.
19. h 5 g 4 (l).	f 3 g 2.
20. g 4 f 3.	e 6 f 6.
21. f 7 e 8.	e 7 e 6 (m).
22. e 8 d 7 (n).	e 6 d 5.
23. d 7 c 7=five.	

NOTES.

(i) These two moves of Black were compulsory.

(j) Must, because he cannot stop the line at d 1.

(k) White now threatens to win by c 5 c 6 and on to c 7.

(l) A good move to go on to h 2.

(m) He ought to have played c 6 d 7, then the game might have proceeded thus: e 8 d 8, d 7 c 7; e 4 d 5, e 7 d 7; d 6 c 6,

c 4 b 5; d 3 c 4, h 4 g 4; c 5 b 4, any; e 5 e 4=five.

(n) There are now two lines for White, and only one can be stopped.

The third game between these two players

had twenty-four moves, lasted about half an hour, and was won by the second player (M.). The fourth game lasted two hours, had seventy-five moves, and was won by the second player (S.).

"THE AIR THAT LED TO VICTORY."

(See the Coloured Plate.)

LONG coat, cocked hat, and scars a-
The time-worn Chelsea pensioner;
His life from out his breast he draws,
Amidst his comrades' grave applause.

Ah! when that ancient life was new
What spirit-stirring airs he blew!
They knew them well, those war-worn men;
Their hair had not grown silver then.

And as they listen they can hear
The tramp of horses drawing near,

Can see the steel-clad line advance,
The sunshine flashing from each lance.

They hear the stirring trumpet-blast,
The time to fight has come at last!
Their eager hands are on the rein,
Once more they dash across the plain.

The air is over; then there comes
The memory of muffled drums;
Unbidden rise the silent tears
When sounds "The British Grenadiers."

THE "BOY'S OWN" MODEL LAUNCH ENGINE.

By H. F. HOBDEN.

PART II.

THE excentrics may now receive attention. They will require to be chucked twice, and the true centre marked. Do not drill it out yet, as the hole for the crank-shaft must not be in the centre, but half the travel of the slide-valve from the centre. For instance, if the valve travelled one inch you would have to drill hole for shaft half an inch out of true centre of excentric.

The straps (Fig. 7) have to be turned quite

true to the size of the groove on excentrics, then taken out of lathe and cut through line

FIG 8

A B with a fine saw and screwed together at C C. A hole has now to be drilled at D and

FIG 9.

tapped for the excentric rods to be screwed into, one of which will have to be bent like

Fig. 8, so as to allow it to work on to the quadrant. It is the neatest way to key the excentrics on to the shaft with a small steel wedge.

The quadrant (Fig. 9) is of brass, and will have to be finished up with a file and emery, and the holes A B B drilled through. The shaft ought to be turned up in the lathe as

FIG 10.

well as the fly-wheel and coupler, with a slight groove sunk in where the plummer blocks support it, so as to take the thrust. The bed-plate you have already been told how to cut out in a former paper, as well as the plummer blocks and coupler.

The reversing quadrant with the lever attached I have shown at Fig. 10. It is best cut out of brass. The notches are cut with a

small file after the two pieces have been brazed together with a small piece an eighth of an inch thick between either end. It is then screwed on to the slide-valve case.

The lever is drilled at A, B, and C with small holes, and can be made of flat steel wire; A is for a pin to work into a joint or hinge on bed-plate. B is attached to the hole A (Fig. 9) by a small length of brass rod, so as to work easily. Cut with a slot at each end and then drilled like Fig. 11.

FIG 11.

The small spring D (Fig. 10) is to keep the ratchet down in place, and is best made from a watch-spring, and the handle F is turned out of some brass wire.

The different-size drills you will require can be easily made from various steel knitting-needles warmed, filed up to shape, and then tempered to a light-straw colour.

We now come to the grease or oil cocks, which I have mentioned before. They can be bought ready finished at most model shops, but for those who like to make everything for themselves this is the way to proceed. Fig. 12 is a section showing interior

FIG 12.

oil chamber that allows the cylinder to be oiled without stopping the engine by turning off cock A and opening cock B, then filling with oil; then shutting B and opening A allows the oil to descend into the cylinder and lubricate the surface.

Now for the method. Chuck a piece of brass wire about a quarter of an inch in diameter in the lathe, and turn up to external shape; then turn out cup C and drill through from end to end with fine drill; then enlarge chamber D with small bent graver, and take out of lathe and drill through at right angles to previous hole at A and B with larger drill; then put plugs of brass wire in and fit them with emery and oil; rivet over one end, and the other turn up into a handle. Then turn them in straight line with the oil-cup, and drill through with the small drill again. Tap the end E, and screw into cylinder cover, when it is finished.

To keep the boiler full of water as the fire empties it by driving it off in steam, the usual thing is to use a force-pump worked by an eccentric on shaft; but, as the friction is excessive, it takes a great deal of power away from a model. It is best, therefore, to work it by a hand lever, and the pump may be screwed on to the side of boat, and the suction A (Fig. 13) being led through the boat's side and riveted over, and the supply B brazed

into lower part of boiler. C is the lever, and D the plunger, which must be quite true, and turned up in the lathe; likewise the valves E and F and the stuffing-box tapped and drilled. It is best to work it up from a casting, and the outside smooth down with an old file. The projection G will then have to be drilled and the lever pivoted through,

FIG 13.

having first cut a slot at H to allow the lever to rise and fall.

I will now describe a method of making an injector, or machine for filling the boiler with water by the power of the steam alone, and not in connection with the engine.

The injector was an accidental discovery by a Mr. Gifford, and has now become a universal favourite on board both large and small craft, as it works splendidly without affecting the engine. So you can run the boiler up with water whilst the engine is at rest in harbour or otherwise. And another great advantage over pumps is that the steam, being mixed with the water, raises it in temperature to nearly boiling-point, and so is a great saving in fuel.

Fig. 14 is a section of the instrument as fit

FIG 14.

for model work, and if you will follow these instructions carefully it will act well.

It consists of three parts—the cone A, the cone B, and the casing C. The steam is admitted at D and the water at E, the waste water overflows at F, and the hot steam and water is projected with great force into the boiler through the pipe H, which should be led to the bottom of boiler well below low-water mark, and it is quite imperative that the steam-pipe should come from top of boiler so as to get plenty of dry steam, and must not be tapped on to any other pipe.

The injector can be fastened to side of boat by brass band and screws, and the water-supply pipe brought through the side and riveted as in the case with the pump. The injector will lift water several inches, but it always works better if the water can flow into it freely.

Now we will set to work at it. Take a piece of brass rod and chuck it in the lathe and turn two cones the shape of A and B (Fig. 15). Take them off the lathe and drill A through as far as practicable, and finish with a small rhymer, having first made a small hole right through not larger than a knitting-needle; then tap the port C with an internal screw to take the steam-pipe, and turn a screw on the outside at D.

Now, with the rhymer bore out the conical hollow at E in B, and tap it outside at F and inside at G, in the same manner as the former cone; then drill a small hole right through from end to end, and a smaller one at right angles to the other right through at H. This communicates with the overflow, and takes off the water not carried into the boiler.

Next take a piece of brass tubing five-eighths of an inch in diameter and turn a screw at each end inside (Fig. 16). The

FIG 16.

screws turned on the outside of the cones must be the correct size to fit these; then drill a hole at A and screw in a small tube for water-supply with tap; then drill another at B for the waste water to escape by. Finally, screw in the cone A (Fig. 15) and attach it to the boiler by a pipe, and the nearer the boiler the better, as if the steam condenses before reaching the injector it will stop working. The steam-pipe must of course have a tap to cut off steam when not required.

We must now screw in the lower cone B (Fig. 15) until there is an annular space

FIG 15

between the two cones not exceeding a sixteenth of an inch. Then screw in the small pipe at G (Fig. 15), and attach the other end into the boiler below the water-line, where it must have a stop-valve to prevent the water returning.

To start the injector, turn on the water-tap until it runs out of the overflow freely. Then turn on the steam full power, and the overflow will cease, or nearly so. Should it still drip at the overflow, reduce the water-supply by the tap accordingly.

It requires carefulness and patience to make an injector, but when done, and working properly, there are few boys with a mechanical turn of mind who would not think themselves well repaid in watching and controlling its mimic action. They would then have an engine fit to show to their most critical friends, and one they might well be proud of; and I shall be content if I have helped in any way to contribute to their happiness.

(THE END.)

ORILLIA.—Your suggestion that the letters N.B. after an address should be confined to letters intended for New Brunswick, Canada, is an excellent one. There is no real necessity for Scotch letters to be so distinguished, as the large towns are too well known to require it, and the name of the county is always given in the case of the villages.

HERCULES.—1. Strictly speaking, a clipper ship is one with a clipper bow. 2. Cannot say, but the number of guns has nothing to do with it. It is the calibre of the guns you should look at. 3. You can get a cover for the "Boy's Own Annual" from any bookseller by ordering it, or you can get it better through your bookbinder, who requires it to bind the volume. 4. Yachts used to carry guns and fire them off at all hours in a most irritating way; but the practice has fortunately gone out of fashion, and a signal-cannon only is now carried. 5. "Our Holiday Tramp" was in the second volume.

T. S.—The best plan is to get the catalogue of some nautical bookseller. There are several published cruises of smaller craft, such as those of the Osprey, Silver Cloud, Procyon, Orion, and Falcon.

AMATEUR VIOLINIST.—Nearly all the good violin makers and dealers live in Soho. You must choose for yourself. There are frequent sales of musical instruments in Leicester Square and Covent Garden, for notices of which you must scan the daily papers.

H. S. BRIANT.—It is about as impossible for us to reply to correspondents by letter as you would doubtless find it to enter the Navy as lieutenant. It is very kind of you to wish to volunteer, but the authorities prefer specially trained officers, who have passed their examination as cadets in their thirteenth year, and to whom they have taught navigation in their own way.

A. WITTINGTON.—Water-colour drawings should remain unvarnished. The only varnish permissible is one made by dissolving Canada balsam in turpentine, or a paper varnish, so called, which is specially prepared. In such matters, however, sparkle and shine should exist only in a metaphorical sense.

NOEL.—Boy clerks are not examined for particular offices. They are appointed as required.

H. G.—Get the pamphlet on army recruiting from the nearest postmaster.

W. G. C.—There is no such officer in the Royal Navy. Before setting your heart on an appointment you should make quite sure that such an appointment exists.

F. WILBRAHAM.—The subjects for examination are advertised in the newspapers, and a list can at all times be had from the Civil Service Commissioners.

INGOLPH.—Such an institution would be an orphan asylum, and appear in the list in the London Directory or elsewhere.

H. J. EDRE.—1. The Lifeboat Fund has been closed for some considerable time. The boats are placed and at work, and we have nothing more to do with them. 2. Wear woollen socks, loose boots, and keep your feet warm. 3. No.

ODO.—1. Just stretch the skins on a board hair downwards, and tack them on. Give them two or three doings over with the strongest solution of alum you can make, and rub well and scrape till soft. 2. Feed white mice on canary seed only, and give little water. They do not smell so if kept thus.

STUDENT.—1. The "Black Stream" is the Japan current, so called from its deep blue colour. The "Cold Wall" is the boundary line of the Gulf Stream. 2. The best book on the people of the Congo is H. H. Johnston's "Up the Congo to Bolo-bo." 3. The Copts are generally taken to be the descendants of the ancient Egyptians. 4. It is not known for certain which is the largest island on the globe. Australia has long been transferred to the continents, and you must take your choice between Borneo, New Guinea, and Greenland until they have all been accurately surveyed. 5. The "Plains of Promise" are in Australia, up Carpentaria way.

F. BONNER.—The appointments are restricted to boys from Greenwich School.

A. B. C.—Take the violin to a connoisseur. If it is genuine it is worth something considerable. There is no better maker, but the instrument belongs to his first period. An Anton. Strad. is not met with every day.

TIMOTHEUS.—1. Get the directions with the process, and see for yourself. 2. Not less than eight glasses are required to form the octave, but had you experimented with tumblers and water you would have found out the secret. The more water you put in the glass the higher the note it gives forth. The fingers or corks are best dipped in powdered sugar or some mucilage, so as to cling slightly to the glass.

REGINALD.—"From Powder Monkey to Admiral" was in the first volume, price six shillings. Messrs. De la Rue and Co. are the makers of the anti-stylograph.

E. D. J.—1. We only give a coloured plate with the weekly number once a year, and that on the first week in October. 2. You must choose for yourself. Messrs. Baker, Cary, Browning, Steward, Ladd, etc., are all well-known opticians.

SOUTH AFRICA.—1. Competitors send in from Australia, and that takes even longer. 2. The cash is now always given; never the value unless by special request of the winner. 3. London is so large that it is divided into districts, each of which is practically a post town by itself, and to it the letters go direct. E.C. are the initials of Eastern Central, W.C. of Western Central, E. of Eastern, W. of Western, N. of Northern, N.W. of North-Western, S.E. of South-Eastern, and S.W. of South-Western.

ANXIOUS ENQUIRER.—Refer to No. 202. You will there find the easiest way of skeletonising leaves fully described.

EQUARIA.—You will find articles on the Aquarium, if that is what you mean, in the July and August parts for 1880.

C. CHANDLER.—Forty-four miles is almost too much for a boy to walk in a day. You could probably get a map at the railway bookstall; if not, write to Stanford, Charing Cross, for catalogue, and state the district you wish the map to comprise.

J. SMITH.—1. A highly ingenious theory, but you have forgotten that it is impossible to give all the pros and cons in school books, and that the statements in them are only substantially correct. For instance, the earth is not exactly an oblate spheroid, but only an irregular approach to one, and the measurements of a degree have all been found to vary. The amount of the flattening differs on the opposite sides of the globe. You might also have remembered that the hills and the sea-bed must make a difference in the respective areas. The general fact, however, remains unaltered. 2. Here again London is not quite the centre of the land hemisphere. The actual centre is 50° 30' W., 51° 30' N., or a little south of The Smalls off Milford Haven. An "Universal Empire," with a capital at The Smalls, might afford scope to the scoffer.

EGBERTUS MINORUS.—The articles on Cardboard Modelling were in the December part for 1882 and the January part for 1883.

A WELL-WISHER.—The Model Steam Engine articles were in the September and October parts for 1881.

SPECIAL NOTICE.—CHRISTMAS NUMBER OF THE "BOY'S OWN PAPER."

lease to take notice, that this year, as last, we shall issue a

SPECIAL EXTRA CHRISTMAS NUMBER

of the BOY'S OWN PAPER, to consist of sixty-four pages, devoted to Seasonable Stories, Acting Charades, Music, Games, etc., etc., the whole fully illustrated by the best Artists.

This CHRISTMAS NUMBER will be issued with the December Part of the "Boy's Own," and will cost 6d. All our readers should endeavour to secure a copy.

As it is intended to print only a limited number, and it will be impossible to reprint, readers who would ensure obtaining copies are strongly advised to give their orders to the Booksellers AT ONCE, by which means they will of course obtain precedence over the ordinary purchaser. It may be remembered that readers who failed to do this in regard to our last Christmas Number, found themselves unable to obtain it; and the very same thing is of course not at all unlikely to occur in regard to THIS YEAR'S NUMBER, which will not be included in the bound volume.

No. 303.—Vol. VII.

SATURDAY, NOVEMBER 1, 1884.

Price One Penny.
[ALL RIGHTS RESERVED.]

JERRY'S VISIT, AND WHAT CAME OF IT.

BY THE REV. H. C. ADAMS, M.A.,

Author of "Schoolboy Honour," "For James or George?" etc.

CHAPTER I.

WHEN I was in the Sixth Form at Thornborough—it was in Dr. Allen's time, and I don't like to think how many years ago—there came to the school, about a year before I left, a little fellow named Jerry Mainwaring, or Mannering, as he pronounced his

"Leaning his head on his hand he fell fast asleep."

name. He was not more than ten years old, and consequently was almost the youngest boy in the school. But he soon made his way and became a prime favourite among us. He happened to sleep in my room, and was therefore my fag; and before the end of the half I had got to like him so much that I asked him to pass a fortnight of the summer holidays at my father's house, where he so took every one's fancy that we wouldn't let him go under a month. He had curly brown hair and a pair of merry black eyes, and was as sweet-tempered as he was handsome. He had plenty of pluck too. It was a sight to see him skim up into a high elm after a bird's nest, or leap our pony over Whalley Brook. We had had some scruple about letting him ride Sandy Bean; for Sandy, though he had plenty of go in him, was cross-tempered and given to bolt with the bit between his teeth, and none of my younger brothers were fond of mounting him. But Jerry leaped on his back as fearlessly as though he and Sandy had known each other for years, and the brute was as docile as a dog with him. My father was so delighted that he would have given him the pony, only there was no place where Jerry could keep it.

Well, it was about the middle of the third week in December, and the school was on the point of breaking up. The half-year's marks had been summed up and the prizes determined. Tomorrow was speech day and packing-up day too, and on the next morning we were all free to depart.

It was my last half, so that I had to take away not only my clothes, but my books, my cricket-bats, fishing-rods, writing-desk, pictures—everything that I had been collecting during my five years' stay at Thornborough. Jerry had been helping me, and it was getting near supper-time, when a letter was handed to him which had come by the evening post.

"From my father!" he exclaimed, as he looked at the address. "What can have made him write again, I wonder? I heard from him only the day before yesterday."

You must remember those were not the days of the penny post and of halfpenny postcards. A letter to Thornborough from London cost ninepence, and though Mr. Mainwaring was not more penurious than his neighbours, he would not be likely to write twice in three days unless there was some special reason for it. It was with some trepidation, therefore, that Jerry tore off the seal, with which letters in those days were usually fastened, and in doing so destroyed part of the outermost page, which had stuck to the wax. He read it through, at first hurriedly, then more carefully, and finally, after five minutes' cogitation, handed it over to me.

"Can you make out what it means, Winter?" he said. "I understand that papa has altered his mind for some reason, and I am not to go to Hampstead—not for the first part of the holidays, in any case, but to some gentleman's house somewhere else. But who the gentleman is, or where he lives, I don't know. The name and address were torn off, I suppose, when I opened the letter, and unluckily I threw the seal into the fire."

I took the letter and read it aloud. It ran thus:

"Belvidere House, Hampstead,
"Dec. 17, 18—.

"My dear Jerry,—I am sorry to tell you that I shall be unable to have you here during the holidays—during the first part of them, at all events. But my father, who resides, as I dare say you have heard me say, at Netherby, has promised to receive you. He is an elderly man and a widower, but he is exceedingly kind to boys, and from his near connection with me will be particularly cordial to you. His servant will come to meet you on the 19th, the day after to-morrow, at the White Horse Cellar, where the coach stops. I have no time to write any more, as I am very busy.—Your affectionate father,
"JEREMIAH MAINWARING."

"Well, Jerry," I said when I had finished reading, "what is it that you want to know?"

"Oh, several things," he answered. "Who can the gentleman be to whose house I am to go? What is his name?"

"That is torn off," I answered. "But he is evidently a very near connection. Have you a grandfather or an uncle living?"

"My grandfather is living," said Jerry; "that is, my mother's father, you know, not papa's. He is living—at least I never heard of his death."

"Ha! and where does he live?"

"I don't quite know, but I fancy at some place ten or twelve miles out of London. He was in business, I believe, but has retired."

"Ay; Ilford or Dartford, I dare say. Depend upon it, that is where you are to go."

"But I've never seen anything of grandpapa," objected Jerry.

"No, why should you?" I urged, for having taken up a theory I liked to maintain it. "You have been very little at home, you know, and I dare say that is the reason why your father wishes you to go there now, to make your grandfather's acquaintance."

"But in that case he'd go to grandpapa too," persisted Jerry, "and it's plain he isn't going there."

I could not deny that there was something in this argument. I had learned a good deal of Mr. Mainwaring's history from Jerry and other sources. He was a literary man, on the staff of the "Daily Argus," one of the leading London papers, and had worked hard to gain the position he occupied. His father, a clergyman with small means, had been able to render him very little help, and his wife brought him only a few hundreds as her portion. When she died, some seven years after their marriage, Mr. Mainwaring had given up his house and gone into lodgings. His boy, then a little more than six years old, was sent to a preparatory school at Parson's Green, and four years afterwards to Thornborough.

But, though living in lodgings at Hampstead, Mr. Mainwaring contrived to make the holidays pass very pleasantly for his boy. Sometimes they were asked to pass a week or a fortnight of the summer at Twickenham or Chertsey; sometimes he would take the boy to Margate, coming down for the Sundays, and leaving him under the charge of his old nurse, who had pleaded earnestly to be allowed to remain with her master as his servant-of-all-work. During the winter it was easier to provide amusements. There

was Exeter Change, and Astley's, and endless exhibitions of one kind or another, as well as Christmas parties, concerts, and other entertainments. Mr. Mainwaring had many friends, and they were all pleased to have Jerry for their guest.

On the present occasion I knew that Mr. Mainwaring had been more than usually anxious to ensure a pleasant holiday for his boy, for he had written to me urging me to stay a day or two in London on my way homeward and partake in the festivities he had arranged. It struck me as strange that he should all of a sudden have altered his purposes and, what was odder still, assigned no reason for doing so.

But the truth was he *could* not assign his reason for declining to receive his son. It was a secret to be told to no one. On the evening of the 16th of December, as he was engaged with his servant Dorothy in drawing up the programme of entertainments for Master Jerry's benefit, there came a hurried rap at the door, and Mr. Hardy, the editor of the "Daily Argus," entered the room.

"A word with you, Mainwaring—alone," he said.

Dorothy withdrew, and the editor went on:

"There is something brewing in Madrid—some plot of Buonaparte's. It is necessary that we should find out what it is."

"There are always rumours of that kind in circulation," said Mr. Mainwaring. "Some people seem to pass their lives in fabricating them."

"This is no fabrication," returned Mr. Hardy. "We have clear evidence that some political intrigue of no common magnitude is in operation. Some one must go to Madrid and learn the truth."

"And you want me to go, I suppose?" said Mr. Mainwaring.

"Yes, you are the man, the only man competent for the task. You know Madrid well, speak Spanish like a native, and have many friends in the city."

"But—" began Mr. Mainwaring.

"But there is no danger," interposed Mr. Hardy—"not what is to be called danger. Of course, if the French ambassador heard of your presence in Madrid and its purpose, you might run some risk of imprisonment or detention. But that would be the worst, and even that is not likely. You would go first to Lisbon, and then as an accredited agent from a mercantile house there to their correspondents at Madrid. There is no risk, believe me, and the pay will be unusually good."

"Well, if you make a point of it I must go, but how soon do you want me to start?"

"To-morrow; the Lisbon packet sails from the docks at two in the afternoon."

"To-morrow! Oh, that is too short notice. I cannot."

"Why? You only want clothes for a fortnight. The passports are already signed, and here is the Portuguese and Spanish money you will require."

"You take my breath away, Hardy. And there is my son, who is coming home the day after to-morrow for his holidays! No, really—"

"That has been thought of," broke in Mr. Hardy. "Our friend and fellow-labourer, Framley—he lives at Stratford, you know—he offers to entertain your boy till your return. He'll have nothing to complain of, for Framley, who is very

fond of boys, has a large Christmas party of them staying in his house, and there will be feasting and merrymaking without end."

"Well, Framley is a capital fellow, that is certain, and what must be must. I'll write to Jerry, then, at once, and tell him of the change. He'll think it odd, but that, I suppose, doesn't much matter."

"Not much," said the editor, with a laugh, as he took his leave.

Well, of course neither Jerry nor I had any suspicion of the cause of Mr. Mainwaring's absence, and after exhausting our ingenuity in all manner of conjectures—for the grandfather theory found little favour in Jerry's eyes—we gave it up, and addressed our attention to more practical matters connected with the affair.

"He says a servant is to meet the coach at the White Horse Cellar, but which coach is he to meet? There are two, you know," said Jerry.

"Yes, there is the Highflyer, which starts at six in the morning; that gets in about one o'clock, doesn't it?"

"I believe so; indeed I'm sure of it, for I went by it last summer. And there's the Eclipse, which sets out at ten and reaches London at five. By which of these am I to go? I have been by both."

"Doesn't your father say? No, he doesn't. Well, then, I suppose you can take your choice."

"In that case I shall go by the Eclipse," said Jerry. "It was pleasant enough going by the Highflyer last summer; but it's another sort of thing turning out on a bitter winter morning two hours before daylight. That is settled, then; I'll go and secure my place by the Eclipse."

The next morning, accordingly, Master Jerry, having made a comfortable breakfast and secured a front seat on the Eclipse, was conveyed up to London, where he arrived an hour or so after dark. He looked anxiously round him as the coach drew up in front of the famous hostelry of those days in quest of the servant who was to be his escort to the house of his, as yet unknown, host. No one coming forward, he descended from his seat, and having caused his portmanteau to be carried into the office, demanded of the bookkeeper whether anybody had called to inquire after "Mr. Mainwaring." A public schoolboy, however small, never condescends to the title "Master."

"Mr. Mannering," repeated the bookkeeper. "Oh, yes, there was a man—a gentleman's servant he looked—he came to meet the Highflyer, and asked whether Mr. Mannering had come by it. He seemed surprised at not finding him. He said he would call again. You had better go and wait in the inner office. I am going away for an hour now myself."

Jerry complied. The weather was cold and the wind sharp. He took refuge in a corner near the fire, where he was sheltered by a pile of boxes. Half an hour passed, and Jerry began to get very hungry, as well as very uncomfortable. He dared not go away to get any food for fear the messenger should return during his absence, and go away for good and all, in which case he did not know what would become of him. He read the bills and advertisements pasted against the walls until he knew them almost by heart; and at last, leaning his head upon his hand, he fell fast asleep.

Meanwhile two persons had entered the office and looked hastily round it, as though they expected to see someone waiting there for them. One of the two was a tall man, dressed in black, with spectacles, and having a shrewd, but somewhat sarcastic, expression of countenance. The other also wore a sad-coloured suit. He appeared highly respectable, but was plainly inferior in rank to his companion, and looked like a gentleman's upper servant.

"This is strange, Hampson," said the taller of the two. "Are you sure Mr. Jerome was to come to this house and at this time?"

"He was certainly to come to this house, Mr. Fenwick," answered Hampson. "The White Horse Cellar was the place named, and there is no other White Horse Cellar in London."

"Not that I ever heard of, certainly," said Mr. Fenwick. "And the time, are you sure about that?"

"I am not so certain of that," answered Hampson. "I don't think any precise time was named, but considering that he has no great distance to come, I made sure he would be here before this. But perhaps they will not allow him to come after all."

"Not allow him!" repeated the other. "Who will not allow him?"

"I was thinking of Mrs. Mannering, his mother, sir."

"Mrs. Mannering! she is not likely to forbid him, surely? She would hardly refuse anything that was likely to be advantageous to him. But this invitation to Netherby Park is the thing of all others most likely to promote his interests. And there is ten thousand a year at stake, remember."

"Well, I do not feel quite so sure, Mr. Fenwick."

"Not sure of what? Of her devotion to the boy's interests, do you mean?"

"No, sir; not that. But she may feel that some apology is due to her before she lets the boy go. Just think, Mr. Fenwick, what wrongs have been done her, what insults heaped upon her."

"True," returned Mr. Fenwick. "Sir Jerome is a hasty man, and cares little what he says when his passion is roused. And it was roused to the utmost by his son's marriage. During all the thirty years that I have known him, I have never seen any fit of passion like the one which came over him when he heard of Captain Mannering's marriage."

"So I have heard, sir, though I was away from the Park when it took place. But I never understood why it made him so angry. Miss Hartley was a lady by birth and education, and, I have been told, much admired."

"That is all true. But in the first place Sir Jerome had made an agreement with his neighbour, Mr. Woodrowe, that his eldest son should marry Miss Woodrowe—Lady Ashleigh that is—who was the heiress of his property, and in the next there was an old quarrel with the Hartleys. He fancied, among other things, that the old vicar, that's dead now, had attacked him in the pulpit. He chose also to believe—that I am sure was quite untrue—that Mr. Hartley threw his daughter as much as possible in the captain's way, in order that the match might annoy him."

"And he would never forgive the captain, sir, would he?"

"Never," returned Mr. Fenwick.

"When the captain's regiment was ordered to Holland to join the Duke of York's army, we tried to make up the quarrel, and urged Sir Jerome at least to take leave of his son before he sailed. But he wouldn't, and when the news of Mr. Jerome's death at Walcheren came, he never showed any sign of grief. What he may have felt I can't say, but he showed no feeling. It is a great wonder, I must say, that he has ever been induced to see this lad, though I am afraid no good will come of it when he does see him."

"It has been Miss Rosalie's doing, sir—mainly her doing, that is," said Hampson. "Sir Jerome has been getting very feeble for a long time past, and more dependent upon her every day. She watched her opportunity, and one day remarked to him that she was afraid the house was very dull and dreary, and she wished there was more to enliven it. 'Ay,' he said—I happened to be in the room, and heard it—if I had some grandchildren, as Woodrowe has, to play about in the lawns and shrubberies, and fill up the vacant places at the table, it would be a little more cheerful."

"You have some grandchildren," she ventured to say.

"Yes, but Henry's children are mere babies; the twins are not two years old and the baby not six months. They are too young for companionship with me. Woodrowe's grandchild is a fine lad of eleven or twelve, rides out with his grandfather, and carries his gun already, I'm told. Woodrowe quite dotes on him. He was here two days ago, and could talk of nothing else."

"Then Miss Rosalie ventured to say, 'You have a grandson, sir, very nearly the same age as Horace Ashleigh.'"

"She was going on, but he burst in with one of his furious attacks. 'No, Rose, I have no grandson of that age. The boy you speak of is a Hartley, not a Mannering. I have nothing to do with him or his. When his father married that woman he ceased to be my son. Don't talk to me of him.' Then he fell back in his chair quite exhausted. Miss Rosalie said nothing more, but presently Sir Jerome added, 'And from all I hear the boy is a genuine Hartley, without a drop of the Mannering blood in him—a whey-faced, sickly little milksop that can't even run about like other boys, but sits moping over his book by the fire all day. I don't want him here. He'd remind me of his mother too much to please me. Don't mention his name to me again, do you hear?' 'Very well, sir,' says Miss Rosalie, and that was all that passed. Is the boy very like his mother's family, do you know, sir?"

"I have never seen him," replied Mr. Fenwick, "but from what I have heard I think it likely that he is. The Hartleys, you know, were never a very hardy race. But what I have heard has been chiefly from Mr. Henry Mannering, and he is not very likely to speak well of them."

"No, sir, nor they of him, if it be true, as I am afraid it is, that Sir Jerome has made a will disinheriting his eldest son's family, and leaving the whole property to Mr. Henry."

"Yes, that's true enough, Hampson. I did all I could to dissuade him from making the will, and he nearly quarrelled with me about it. I should not speak of it, but he himself has made it quite notorious by mentioning it to his friends."

There may be a chance of his altering it now, though."

"How so, sir? I should be glad enough to think that. I was always fond of the captain, who was as true a gentleman as ever lived, and his wife is a sweet lady. But Sir Jerome isn't apt to change his mind."

"True; but as men feel themselves failing, they sometimes get compunctious, and Sir Jerome has sent to me for the will. One of my clerks took it down last week. I can't think what he can want with it, unless he means to add a codicil to it, or alter it."

"That was last week, was it, sir?" asked Hampson.

"Yes. I got the letter on Saturday, I think, and Stephens went down with the will to the Park the same day. Why do you ask?"

"I wanted to know whether that was before his last attack. That occurred on Thursday last. He had been out in his chair on the terrace, and, I suppose, stayed too long. He had more than once refused to go in; but he had hardly got back into his easy-chair when he fell out of it, in a fit of some kind. It was a long time before we could bring him round; and on the Friday he told Miss Rosalie to write to Mrs. Mannering, and ask her to send her boy for a fortnight's visit to Netherby Park."

"Which Miss Mannering was ready enough to do, I imagine?" said Mr. Fenwick.

"Well, no sir. I don't think she was," replied Hampson. "She asked her father whether he felt well enough to receive a visitor, and whether he had not better ask Dr. Staines about it. I think she was afraid that the boy's appearance and behaviour would irritate Sir Jerome, and make him more unwilling to cancel his will than he was already, but Sir Jerome wouldn't have it. 'Staines be hanged,' he cried, 'I shall have who I like here! You have been plaguing me about doing justice to this boy for ever so long, and now I am going to do justice; and to do that I must see what he is like with my own eyes. I'm not going to take a lot of other people's palaver for gospel. Write at once, Rose, to Willborough; do you hear?' She did write, and the answer came that Jerome should be sent up on Wednesday by the coach to the White Horse Cellar, where somebody must be sent to meet him. Accordingly Miss Rosalie this morning ordered me to take the carriage and bring her nephew down from London."

"I am afraid you will not be able to fulfil her orders," said Fenwick. "It is nearly six o'clock—indeed it is more, it is a quarter-past six. We have been talking here for a good three-quarters of an hour. There may be a later coach from Willborough, but I scarcely think it. But here is the bookkeeper at last; he has been to his supper, I suppose. Can you tell us," he continued, addressing the new comer, "anything of a young gentleman who was to come up by coach, and be met here this afternoon?"

"A young gent about eleven or twelve years old?" inquired the man.

"Yes, about that age."

"There is, or was, just such an one," said the bookkeeper. "He came in just as I was leaving. I sent him into the inner office out of the cold, and there he is now. I can see him in the corner there by the fire. Hallo, sir!" he added, step-

ping into the inner office, and giving Jerry a shake, "here are two gentlemen wanting you."

Jerry roused himself from his slumber, and came out to meet his visitors, who looked at him in evident surprise.

"Is your name Mannering?" asked Mr. Fenwick, presently.

"Yes, sir. I am Jerry Mainwaring," answered the boy. "Have you come to meet me? I expected some one, but I thought he must have forgotten me."

"We have been here three-quarters of an hour," said Mr. Fenwick, "but we did not know you were in the inner room. This is Mr. Hampson," he continued, "your grandfather's house-steward, who will take you down with him to Netherby."

"All right, sir. I am going to my grandfather, then, as Winter said," he thought. "That is my box," he added, aloud, pointing to a trunk with the initials "J. M." marked on it in brass nails. "Is there a coach down to Netherby, or have you a gig here, or what?"

"Your grandfather has sent his carriage for you, Mr. Jerome," said Hampson, somewhat stiffly. "I will order the footman to put your trunk on the box beside him. We had better set off at once, as it is late, and your aunt may get anxious. We must wish good-night to Mr. Fenwick, and then we will go."

Jerry shook hands with the tall gentleman, and stepped into the carriage, the appearance of which, as well as of the liveries of the servants, somewhat bewildered him. Mr. Hampson followed, and then they drove off.

"Odd, this," he thought. "I never knew my grandfather kept his carriage, and two livery servants, and a house-steward. I fancied he was rather poorly off. But I have no objection, I'm sure. And this fellow—Hampson, didn't the tall chap say his name was?—he looks a tremendous swell; but if he's my grandfather's servant, I suppose he'll be civil, at all events. I say," he said, aloud, "can you tell me how my grandfather is, Mr. Hampson?"

"He is a little better, Mr. Jerome—"

"I am always called Jerry," interrupted the boy—"please call me so."

"I should not like to take such a liberty, sir," said the steward, "and Sir Jerome would not approve it either. But, as I was saying, your grandfather is a little better; but of course you are aware that he is in a most anxious state, and the doctors speak very doubtfully of his rallying."

"Dear me," said Jerry, "I'm afraid I shall be very much in the way if he is so ill. I don't think my father would have liked—"

"Do not make yourself uneasy, sir. I knew your father well, and am quite sure, if he knew all, he would quite approve of your visit under present circumstances."

"It must be all right," thought Jerry, "if I am going to my grandfather's house, and this man knows my father. But who on earth can Sir Jerome be, and what can he be to me? And I think he said something about my aunt just before we started. Who's she, I wonder? I never heard of her before. I should like to know something about her too. How is my aunt, Mr. Hampson?" he continued.

"Miss Mannering is very well, sir, and very anxious to see you. It has been a subject of great regret to her that hitherto she has never met you."

"That is very kind of her, I am sure,"

said Jerry. "I wonder why I have never seen her. I don't know what there was to prevent it."

"I perceive, sir," said Hampson, in a tone of reserve, "that you have not been made acquainted with the peculiar circumstances of your visit to Netherby Park. It would hardly be proper, therefore, for me to speak of them. You will learn them, no doubt, on your arrival from Miss Mannering herself."

He relapsed into silence, and Jerry made no further attempt to obtain information. The carriage had by this time cleared not only the city itself, but the long straggling rows of houses and cottages which succeeded to the streets. They were now travelling over the open country, and the light from the lamps fell on the hedgerows and trees and fields, varied every now and then by a roadside inn or a country village. They must have gone, he reckoned, more than ten miles before they paused for a minute or two in front of two high stone pillars, flanking a massive iron gate, with an Elizabethan lodge adjoining. A woman came out of the latter and opened the gate, when the carriage resumed its way. Jerry sat in ever-increasing wonder as they drove through a spacious park with clumps of large trees overshadowing broad stretches of turf, varied by glimpses of ornamental water. Presently they entered a stately avenue of beech-trees, at the end of which appeared an ancient Elizabethan house, surrounded by terraces and gardens. The footman alighted and rang a bell, when the door was almost immediately opened, and a servant out of livery appeared.

"Has Master Mannering arrived?" was his inquiry, and it being answered in the affirmative, he added, "He is to go up to Miss Mannering's room immediately. She and Mr. Henry are waiting for him there. You are to go with him, Mr. Hampson."

"Mr. Henry!" exclaimed Mr. Hampson. "Is he here, Hawkins?"

"Come two hours ago," was the answer; "and he ain't here for any good either," he added, in a low tone, which only Hampson and himself could hear.

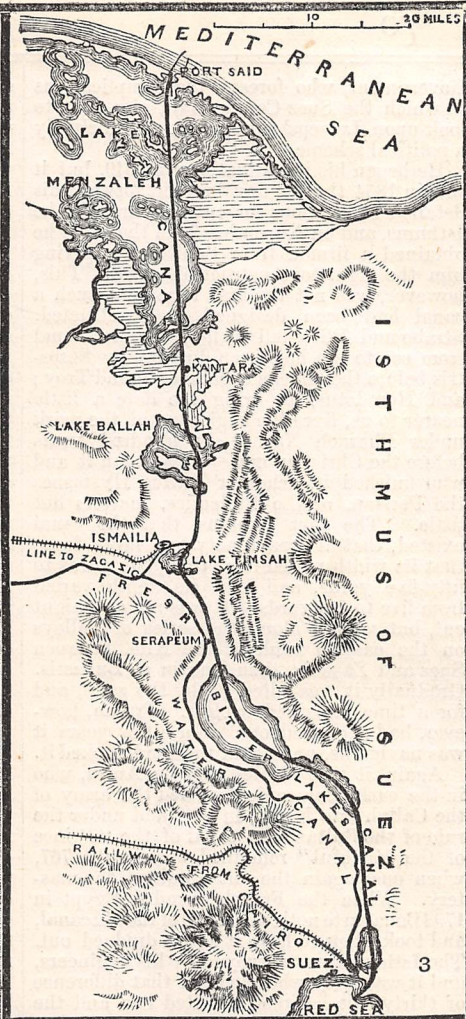

(To be continued.)

THE GREAT CANALS.

I.—SUEZ.

THE world owes much of its advance during these later years to the improvement in the means of communication between its distant countries; and among those who have done most to facilitate commerce by shortening its roads there is not at present a more famous man than the projector of the modern Suez Canal, Ferdinand de Lesseps.

He was born at Versailles in November, 1805. His father and grandfather were in the French diplomatic service, and he is, or was, a diplomatist by profession. He began his official life when he was twenty-one years of age in the French Consulate at Lisbon, and for the next four-and-twenty years continued in the employ of his country. He went to Tunis in 1828, and to Cairo in 1833, remaining there for five years, and gaining that thorough acquaintance with things Egyptian which he afterwards turned to such good account. Subsequently he held appointments at Rotterdam, Malaga, Barcelona, Madrid, Berne, and Rome. His diplomatic experience was thus very varied. His missions were nearly always successful, and it was the knowledge of his previous career that caused the British

The Suez Canal.

1. Zagazig, on the Fresh Water Canal. 2. The old Canal. 3. Map of the Canal. 4. Fellaheen at work cutting the Canal.

Government, who foresaw the complications to which the Suez Canal would give rise, to look upon Lesseps' great work as principally a political scheme.

He began his investigations in 1849, but it was in 1854 that he first brought forward his detailed suggestions for cutting through the Isthmus, and on November 30 in that year he obtained a firman from Saïd Pasha giving him the right to construct his canal. This, however, was not the first time that such a canal had been designed or constructed. Strabo and Pliny tell us how the first canal from sea to sea had been dug out by Sesostri before the Greeks encamped round Troy; and Herodotus, to bring the date a little nearer to us, fixes the beginning of the work under Pharaoh Necho six hundred years before the Christian era. Who began it and who finished it, whether Darius Hystaspes the Persian, or the Ptolemies, matters but little. The fact remains that the canal existed, that it was ninety-two miles long, that its width varied from thirty-six yards to fifty-five yards, and that its depth varied from five to ten yards. It was not a straight cut, but wound along the series of valleys on the eastern bank of the Nile, between Suez and Zagazig, then known as Bubastis. Gradually it was silted up by the sand, and for a time remained useless. Trajan, however, had it cleared out. For a few years it was navigable, and again the sand choked it.

Again it was cleared out by Amru, who in the early Saracenic days led the army of the Caliph into Egypt, in 639, and under the rule of the Sultans the canal of the "Prince of the Faithful" remained open until 767, when once again the silt obtained the mastery. When the French invaded Egypt in 1798 Bonaparte noticed the bed of the old canal, and took steps to have it again dredged out. The Isthmus was surveyed by his engineers, and it was they who reported that difference of thirty feet between the Red Sea and the Mediterranean which was so often quoted as rendering the unlocked canal impossible, and which was found not to exist when in 1847 Robert Stephenson, Talabot, and Nigrelli made the international survey on behalf of England, France, and Austria. These three engineers had been specially sent to report on the means of communication across the Isthmus. There were two schemes under consideration, the canal and the railway, and the triumvirate, on business grounds, reported in favour of the latter. De Lesseps took the matter up where they had left it, but instead of cutting a canal obliquely to the Nile, as they had proposed and as the ancients had done, his plan was to go straight across country and have artificial harbours at each end.

The difficulties in digging the canal were small compared to those in floating the company. There was the report of the engineers giving preference to the railway, there was the avowed opposition of the Turkish Government, and there was the coldness of nearly every Government of Europe, who followed the lead of Great Britain, and looked upon the project as being, like that of Napoleon I., a daring political manoeuvre on the part of the patriotic and accomplished diplomatist. It was not till 1859 that the company got fairly under way. The Viceroy took two-fifths of the shares, the rest being principally subscribed for in France, and for a rent of 15 per cent. on the earnings the "Compagnie Universelle du Canal de Suez" received a lease of the land for ninety-nine years—as many years as the canal is miles in length—the lease being under the conditions usual in England, so that at the expiry of the term the property reverts to the freeholder. The original capital was £8,000,000, but this was afterwards increased until the cost of the work may be set down as £19,000,000, plus whatever may be looked upon as the value of the additional lands lent by the Khedive and the forced labour of his people.

The first engineering difficulty was the

supply of fresh water for the army of workmen, as along the line of the canal there were no springs or streams. This necessitated the formation of the freshwater canal, forty feet wide and nine feet deep, from Ismailia, on Lake Timsah, to Zagazig, and thence along the bed of the ancient waterway of the "Prince of the Faithful" to Suez; while from Port Said to Ismailia there was laid an aqueduct of iron pipes.

The drink difficulty having been disposed of, the cutting of the ship canal began. This starts from the Mediterranean at Port Said, and after passing through the shallow lagoon of Lake Menzaleh, where it has a depth of six-and-twenty feet, runs for eleven miles through an elevated plateau some fifteen to thirty feet above sea-level until it reaches the lake of Abu Ballah. Another spell of eleven miles takes the canal to Lake Timsah through another cutting in the rising ground, which is here at times from seventy to eighty feet above the water. For three miles is the shore of Abu Ballah skirted, and then passing through the Toussoum and Serapeum cuttings, the stream runs into the Bitter Lakes. These Bitter Lakes—the most difficult part of the line, by-the-bye, the bed along them having had to be scooped out with the steam-dredges—extend for some four-and-twenty miles, and then thirteen miles of the Chalouf plateau had to be cut through before the twelve miles of level plain round Suez could be reached.

The construction of the harbours was a very tedious task. That at Port Said was formed by two converging breakwaters, built of immense blocks of cement, each block weighing two-and-twenty tons, and consisting each of two parts of desert sand and one part of French lime. The blocks are not laid in masonry, but thrown down anyhow, and form rough breakwaters, of which one, the western, is much the longest. The alluvial deposits brought along the shore by the drift of the current due to the north-west wind, are stopped by the ridge of stone, and the mouth of the harbour, for the present at least, is kept free.

It is difficult to say which section of the line gave the engineer the most anxiety. Perhaps that through Lake Menzaleh afforded as much as any, for here the workmen had not only to contend with the mud of the lake, but with the waves of the sea. In many other sections also the task was most embarrassing. The steam dredges had to be kept constantly at work throughout; and even now it is no easy task to keep the channel from silting up. Into the Guise cutting it is calculated that forty thousand cubic yards of sand drift every year; while into the Serapeum cutting observations have shown that there is an annual drift of two hundred and seventy thousand.

The sluices were first opened by the Prince and Princess of Wales on March 25, 1869, but the formal opening did not take place until November 16, fifteen years after the firman for the construction of the work had been obtained. One of the greatest naval displays of modern times then took place. Nearly every nation in the world was represented in the harbour of Port Said; and, amid the blessings and prayers of Christian and Mohammedan—from separate platforms erected specially for the different creeds—the Empress of the French led the way down the canal, followed by the Emperor of Austria and other great personages.

At first the canal was little used, but now the amount of shipping that passes through is so great that it is not large enough for the traffic. Out of every ten ships that use it, eight are under the British flag; and it was the importance of the canal as one of the main roads to India which led to the purchase of the Khedive's shares by this country, and to our intervention in Egypt, which on August 19, 1882, brought into it the six-and-twenty vessels that formed Lord Wolseley's expedition. Not even at the opening did the

canal hold a finer fleet than when the seven huge ironclads—the Alexandra, Téméraire, Agincourt, Northumberland, Minotaur, Superb, and Sultan, totalling amongst them a measurement tonnage of over sixty-eight thousand tons—led the nineteen "troopers" into Lake Menzaleh, those same "troopers" being the pick of our ocean-going mail-boats. It is now, however, somewhat ancient history how the Egyptians were led to believe that Aboukir was to be bombarded, and were surprised to find the fleet, with Sir Garnet Wolseley on the Salamis, Admiral Seymour on the Helicon, and the Duke of Connaught on the Orient, steam past Port Said and round into the canal on their way to Ismailia—a surprise by no means diminished when they found that Admiral Hewett had simultaneously seized the southern outlet, and that from end to end the canal was lost to them.

By sailing vessels the route by the canal is not much used, but with steamers it is very popular. The saving in the distances to Indian and Chinese ports is very great. From Plymouth to Bombay by the Cape, the steamer route is 10,417 miles; the route by the canal shows a saving of 4,417 miles! To Galle, 10,160 by the Cape, there is a saving of 3,661 miles; to Calcutta, 11,300 by the Cape, the saving is the same; to Singapore, 11,490 by the Cape, there is a saving of 3,480 miles; to Hong Kong, 12,930 by the Cape, to Shanghai, 13,730 by the Cape, and to Yokohama, 14,490 by the Cape, there is in each case a similar saving of 3,480 miles. In the Australian routes the savings are much smaller. From Plymouth to Melbourne is 11,890 miles by the Cape, and 11,039 by the canal, thus showing a saving of only 851 miles; to Sydney, by the Cape, is 12,440 miles, by the canal it is 11,590; to Wellington, by the Cape, is 13,360 miles, by the canal it is 12,510—back by the Horn it is only 11,670. These are *exclusively* steamer distances; the distances traversed by sailing vessels are in all cases greater, sometimes by as much as 2,000 miles, but, for reasons already given, these need not be taken into account.

the reign of Edward I. Fig. 19 is from the effigy formerly in Gorleston Church, Suffolk, and represents a knight of the Bacon family, whose cognizance is depicted on the shield.

It illustrates an interesting example of the transition from chain-mail to plate-armour. Notice on the right arm from the shoulder to elbow is a plate called the vambrace; also on the inside of the arm from the pit to the wrist is another plate called the rerebrace; over the elbow is a cap called coniere; on the top of the arm and the inside of the elbow are two circular plates called roundels, invented to protect the joints of the arm when the chain-mail was removed from underneath to give greater freedom of action. This brass also exhibits a curious fashion in armour, which lasted for many years—that of having little wings or ailettes of metal attached to the shoulders. These

were worn both in battle and in the lists, and were generally emblazoned with a cognizance. In our cut the cross of St. George is depicted on them.

The reigns of Richard I. and John exhibited for the first time heraldic cognizances, fixed designs being appropriated by individual families. They were emblazoned on the gonfalon, or little flag on the shield; also on the jupon, which was a tight-fitting tunic, hence the term "coat-of-arms." Edward the Black Prince's tunic, emblazoned with the arms of England and France, is still hanging over his tomb in Canterbury Cathedral, as probably you may have seen.

The cyclas during fighting would obviously get slashed and torn to ribands, and present an appearance of which the knights would be proud, as showing they had been in action. The heraldic artists of the period designed

these torn clothes into mantling and lambrequin, of which Fig. 22 is a fancy-dress example. The helmet takes the form of the salade, of which we have more to say.

Now approaches the interesting period of plate-armour. From the description already given of Charlemagne and his staff, the wealthy seem to have had even then part plate-armour. The invention of entire suits of this armour appeared in Italy about the year 1315, and the fashion spread gradually to England. The arms and legs, as we have shown, had the first plate-armour. Then a helmet that covers the head succeeded the iron cap.

Fig. 23 shows in the helmet an opening turning on a hinge called aventail; the body is covered with a masceled or pourpoint pattern; and the shoulders, elbows, knees, and boots are of plate-armour.

SCHOOL AND THE WORLD.

CHAPTER VII.

"Tommy could see the first was a boy, the second a man."

TOMMY was another boy again; the load was off his heart, he felt as if he did not care what might happen now. And before long something did happen.

He had nearly reached the corner of the corridor when he heard a door in the distance creak.

His heart gave a jump; he had not thought of danger on his way to Soady's room, he was too full of his trouble. But now he was alive to the slightest sound.

He backed into a doorway, crouched down, and waited. Perhaps it might be robbers; perhaps the Doctor or some master has found his empty bed and was looking for him.

Something white appeared round the corner. Tommy's heart almost stood still. Then following the white figure came a black one. In the dim light Tommy could see that the first was a boy, the second a man. The odd thing was that neither seemed to take any notice of him; from where he crouched he could have touched them as they passed, but they went steadily on. Not that Tommy had any idea of touching them, he was much too frightened.

Directly they passed him he bolted for his room. He forgot all about making a noise now, and as he took a flying leap into bed he woke two or three sleepers. At the same time there was a strange sound in the distant corridor, then came silence.

"What's the row?" asked Featherstone, sleepily. "Are they having a bolster match?"

"It's a ghost!" said Tommy.

"Whose, you young idiot? Why, where's Simpson?"

Simpson's bed was empty, but his absence was not long unaccounted for. There was a sound of feet outside, and in a minute or so Simpson appeared, with nothing on but his trousers and night-shirt. Accompanying him were Mr. Pickering and Melhuish.

"Now go to sleep all of you," said the master. "Thanks, Melhuish, I needn't keep you out of bed. Good night."

"Hullo, Simpson! Where have you been?" inquired Featherstone.

"They stuck to it like grim death."

"Been trying to find my money," was the sleepy reply.

"What money, you young Cræsus?"

"Never you mind," returned Simpson, who now remembered the Doctor's caution to keep his tongue still.

CHAPTER VIII.

THE mysteries of the night were cleared up next morning. It seems that Mr. Pickering, who had a bedroom on the farther side of the quad, happened to be sitting up late that night, hard at work on an edition of Juvenal that he hoped some day to publish. Happening to glance up for a moment, he fancied he saw a figure cross a window of the opposite wing.

He watched for a minute, but there was no reappearance. He settled down

him and kicking his boots off, Mr. Pickering rapidly ran down the corridors, and then hid in a half-open doorway.

He had not to wait long. A boy came slowly walking along, so naturally and unconsciously that it was easy to guess that he was walking in his sleep. Mr. Pickering followed him to see where he was going, for he at once recognised the boy as Simpson, the loss of whose money had occasioned the excitement of the previous day. Mr. Pickering knew the strange things often done by somnambulists, and how they totally forgot what they had done when asleep, so he felt some curiosity to see whether Simpson was about to hide some more money and then announce next day he had lost it.

But the master's curiosity was not destined to be satisfied. Not long after he had passed the spot where Tommy

was concealed, Simpson hesitated, stopped and would have fallen had not Mr. Pickering caught him. The noise brought to the door Melhuish and Soady, who were wide awake, and Melhuish helped Mr. Pickering to take the mystified boy back to his room.

"So, my young Tommy," said Soady to his chum, to whom he was recounting all he had heard about it, "you see you had an uncommonly close shave last night. If you have many more such shaves you'll cut yourself. So don't you go cutting about the passages in the middle of the night again."

"All right; I won't," said Tommy. "So they think Simpson stole his own money, do they?"

"Don't know; the Doctor seems to think so, from all I can hear. Oh, here's a nuisance! if this isn't Lang coming! You run away, Tommy, and practise for the athletic sports. If you don't pull off something I shall take it out of you."

It was indeed Lang who was approaching, and if ever a boy's look betrayed his anger his did now.

"Soady, you're a beastly sneak!" he began. "You told the Doctor that I was in the Rummage-room yesterday."

"You'd better keep a civil tongue in your head if you want me to take any notice of what you're saying," retorted Soady.

"A civil tongue! It's easy enough for you to talk. You think that because you're the bigger and could lick me that I'm going to let you do what you like, but I shan't. I tell you you're a beast of a sneak, and you can make what you like of it."

Soady hesitated for a moment. He felt inclined to prove to Lang he was correct in one particular, at all events, that he could lick him if they had a fight. But at this moment Garland passed close by, and, hearing the row, stopped to see what was the matter. Soady, on seeing him, dropped his hands. He felt it would be a mean action to lick Lang for what he had said in ignorance of the truth, and he could not do a mean action with Garland looking on.

"I say, Garland, come here!" he cried. Garland walked up. "What do you want?"

"Lang here has been slanging me because he says I told the Doctor he had been to the Rummage-room lately. I didn't tell the Doctor; Mr. Pickering did."

Soady proceeded to explain how the mistake had arisen.

"That's clear enough," said Garland. "I can't see that any blame attaches to you. What do you want me to do?"

"Tell Lang what he ought to do now that he has been slanging me without any reason."

Garland looked at Lang for a moment. "I don't think that's necessary," he said, quietly. "I'm quite sure Lang knows the right thing to do as well as I do."

There was a slight emphasis laid on the "knows." Garland walked away now, thinking it would be easier for Lang to apologise if a third person were not present.

Lang's better nature triumphed for once; he told Soady he was sorry, and asked him to let it all drop. Soady was only too delighted; he hated having rows with fellows because it was "such a lot of trouble to remember that you had quarrelled with a chap, and if you hacked him at football he was sure to think you did it on purpose."

"Tell you what, Lang," he said, "nobody thinks you had anything to do with that business, of course, but the best way of satisfying everybody will be to find out who did take Simpson's cash. Now you leave it to me, I'll find out, don't you fear."

"Do you suspect any one?"

"I've got my eye on some one; I'll let you know if I find anything out. Don't you tell any one."

With this superfluous remark Soady ran off to find Tommy and consult with him.

Tommy was discovered in the gymnasium hanging by his toes from a rather high horizontal bar. He had let himself

down all right, and was hanging splendidly, but for the life of him he couldn't get back to the bar again.

"Wonder what his mother would say if she could see him?" thought Soady. "Hullo, what's young Featherstone up to?"

That young worthy was standing beside Tommy, but making no effort to rescue him from his dangerous position. On the contrary, he was busily employed in picking up the contents of Tommy's trouser pockets which had emptied themselves on to the ground beneath.

"Young varmint!" ejaculated Soady, mentally. At the same moment Featherstone felt a heavy hand on his arm, and Tommy was landed on the ground right end uppermost.

"Why didn't you help him down, you young beggar?" demanded Soady.

"Please, Soady, he was seeing how long he could keep up, and I was only picking up his money for him so that it shouldn't get lost."

"What a cram!" exclaimed Tommy. "I was just tumbling off and he wouldn't help me."

"Let's see how long you can stay up," said Soady to Featherstone, putting him on the bar.

"Oh, please, Soady, let me down! I'm giddy!"

"You'll get over that," was the unfeeling remark.

"Oh, please, Soady, let him go."

"Nonsense, Tommy, up you go too. Sixpence to the one who hangs on longest."

They stuck to it like grim death, Soady watching them to catch them if they fell. At last Featherstone gave way and was helped down. Tommy took the sixpence.

"Come along to Mother Shipton's," said Tommy to the other youngster, "we'll have some truck."

"Off you go," said Soady. He watched the two run off with considerable relief. Featherstone was not at all a bad little chap, and it would do Tommy worlds of good if he would chum up with some one his own age, and go in for sports more. Soady was not good at classics and mathematics, but he had a keen feeling for others, and more judgment than many far cleverer than he as to the best thing to be done with a boy to make him turn out as a boy should; not a clever rascal, but a good fellow, whatever his attainments might be.

(To be continued.)

THE ADVENTURES OF AN AIDE-DE-CAMP.

I.—THE WRECK.

THAT the extraordinary adventures of General Haldiman's aide-de-camp have never been used as the basis of a romance is perhaps due to the fact that they form a perfect story of themselves. They need no embellishment; the characters are there, the incidents follow each other in admirable order, there is a definite plot, the one object is pursued throughout, and the story ends, as all such stories should end—in that object being attained. Under these circumstances a preface is hardly required, and so, without further ado, we give our summary of Captain Prenties's official report, published in 1782.

In the late autumn of 1780 General Haldiman, commander-in-chief of the troops in Canada, finding it necessary to communicate with General Clinton, then fighting Washington in front of New York, selected Captain Samuel Walter Prenties, of the 84th Regiment, to be the bearer of his despatches—or, rather, one of the bearers, for the intelligence being of great importance, the despatches were sent in duplicate, Captain Prenties taking one copy, and Ensign Drummond, of the 44th Regiment, taking the other. A smart brigantine, the *St. Lawrence*, was then at Quebec loading with timber, or lumber, as it is locally called, and in her Captain Prenties secured a berth. Ensign Drummond went on board a schooner bound also for New York, and the two vessels started down the river together on the 17th of November.

Contrary winds kept them in the river for some days. The cold weather set in, and ice began to form along the banks. Before the open sea was reached the *St. Lawrence* sprung a leak, and the pumps had to be kept constantly going on board of her. The schooner also was much knocked about, and the ice began to cling round the ships.

The *St. Lawrence* carried six passengers, and the officers and crew numbered thirteen. The captain, though plausible enough on shore, proved outrageously violent at sea. He seemed curiously excited at the discovery of the leak, and after trying his best for a

time to check the rising water, retired to his cabin and drank himself into senselessness. The second mate followed his example, and the crew altogether seemed a very miscellaneous lot, and under little restraint.

The water continued to rise in the hold, and not long after the captain had retired the crew refused to work the pumps any more. The cold was intense. The gale was raging heavily. The brigantine appeared to be gradually settling down, and matters looked so hopeless that there was really some excuse for the decision of the men. As, however, the water, when the pumping ceased, began to gain at an alarming rate, Captain Prenties went amongst the crew and persuaded them to continue at the pumps a little longer. He had some wine of his own on board, and this he served out to them at the rate of half a pint per man per hour. The gift of the wine had such an effect on the men that the water in the hold was soon reduced to three feet, and at this depth it was kept for some hours.

On the following morning, that of 2nd December, the gale increased, a snowstorm came on, and in the thick of the storm the schooner went ashore on Coudres Island. The people on the brigantine could render her no assistance, for the snow fell so fast that they could not see for any distance round them. To keep up communication between the vessels guns were fired at half-hourly intervals. Suddenly the answering reports ceased. The schooner had gone down with all on board!

The storm continued, and the first mate, on being appealed to, guessed the *St. Lawrence* to be near the Magdalen Islands, a small group of rocks to the north of Cape Breton. In a couple of hours the roar of the breakers was heard through the blinding snow, and the rocks were shortly afterwards sighted a few hundred yards away. The ship was running before the wind under close reefed foretopsail, and it was no easy task to steer her clear of the "Dead Man." The dangerous barrier was, however, passed in

safety, as were also the scores of other rocks that bordered the narrow channel through which the vessel drove.

At five o'clock the next morning a huge wave struck aft, drove in her sternpost, carried away the deadlights, and poured into the cabin. The crew stopped working the pumps, expecting the ship to founder; all the hatches on the deck were frozen down, and the passengers, finding nothing else in the after hold, attempted to caulk the leaks in the stern with slices of beef. The captain was asleep, the crew were completely tired out with the constant work and the cold. The wind blew with ever increasing strength and keenness, the snow fell thicker and thicker, and the ropes and spars were one mass of ice. Captain Prenties went to the men, and pointing out that the waves were shorter and breaking higher, thereby showing that they were not far from land, prevailed on them to make one more struggle to keep the water down. The crew consented, but the plungers proved immovable. The pumps had frozen during the interval of rest!

The crew then left the deck, over which the icy water swept, and, steered by the only man that dared brave the storm, the *St. Lawrence* drove on to her doom. Her timber-cargo saved her from sinking, but the water in her hold had made her so crank that the only way to prevent her turning over was to keep her dead before the wind. After a time the steersman saw a gull swoop past through the snow, and then some ducks came by, and thus he knew he was nearing land. Then the snowstorm cleared away, and before him he saw the precipitous cliffs of some rock-bound coast.

The captain, who had now awoke, recovered sufficiently to enable him to interfere with the working of the ship. He ordered her to be brought to. In vain it was explained to him that the manœuvre would throw her on her beam-ends. He insisted on having his way, and the crew went to the braces. He gave the word of command. But

the ropes refused to move; they were frozen into the blocks as hard as iron.

On went the brigantine straight for a fringe of breakers about three miles from the land. As they neared them the crew waited for the crash to be thrown into the icy sea. With one slight graze, however, the St. Lawrence leapt through and flew along straight towards a little beach between a gap in the precipices. When she was within fifty yards of it she struck on the sand.

There was only one boat on board, and this was frozen in so hard that it had to be chopped out, and the waves were thundering so angrily on the beach that only six men dared try their fate in attempting to land. These were the first mate, two seamen, Captain Prenties, his servant, and a boy passenger. When the St. Lawrence struck, the aide-de-camp had gone to his cabin, wrapped up his papers and despatches in a handkerchief, and tied them round his waist. His servant picked a bag containing one hundred and eighty guineas out of his trunk for him also to take with him, but the captain, seeing that no use for money, declined it as an incumbrance, and gave it to the man, who immediately fastened it round his waist, as his master had done the despatches.

Seizing a hatchet and a saw, Prenties jumped into the boat, in which were the mate and the two men. The servant followed, and then the boy tried. As he jumped, however, the boat lurched, and the poor little lad fell into the sea. After much effort he was saved and pulled on board, and then the boat left the ship and was swept on to the land. Once there, it was evident that to return and save any of the others was impossible. The wind was blowing dead on to the shore, and the waves were coming in with such fury that no boat could live against them.

And so the six drew up the boat out of danger, and made their way through the snow, which was up to their waists, to a little wood that came down close to the beach. They had no fire, for the tinder-box had got wet in the passage from the ship; they had no

shelter, and they had no food. The cold was so great as to benumb them, and it was with great difficulty that Prenties and the mate could keep the men awake, for to sleep under such circumstances was to die. The poor boy had got wet through by his plunge into the sea, and his clothes were frozen on him. Every effort to keep him awake proved futile, and at last he dropped down and slept. A few minutes afterwards Prenties thought he was dead, and felt his cheek. The little fellow only just woke to die, whispering the kind-hearted aide-de-camp to write to his father, to whom he had been on his way, and tell him how he had gone to another Father along that cold road in the snow.

And now the three men lay down in spite of all that Prenties and the mate could do. To allow them to sleep was not to be thought of, and so to keep all moving Prenties cut a pair of switches off a tree, and with these he and the mate watched all night and slashed the half-torpid three each time they closed their eyes. All night long the watching and slashing went on in the piercing north-westerly wind, but when the morning broke though Prenties was untouched by the frost, the mate was slightly nipped, and the three men were each frozen halfway up their legs.

The ship had not broken up. The tide had gone out, and she was close to shore. A rope was thrown from her; one end of it was fastened to the jibboom and the other to a tree on the land, and along it came all but two that had passed the night on board. One of these—a passenger—had died; the other—the carpenter—was drunk. The fugitives brought no food with them, but one man had a tinder-box, and soon a fire was kindled. It took all that day to rig the rope and get the people to land.

The next day the violence of the sea had somewhat abated, and the carpenter was taken off, frozen in all his limbs; and on the 8th of December the St. Lawrence went to pieces along one side of her, and some beef and onions floated ashore. These were picked up and greedily devoured, for there

had been no food for four days. Deals came floating in from the wreck, and of about two hundred of these a house was built, twenty feet long by ten feet wide. The construction of this house was peculiar. Two trees were taken at the twenty feet apart; and some distance up them, stretching from one to the other, on each side of their trunks poles were lashed, so as to leave a space between of about a foot all along. Against these poles the planks were laid at an angle of about sixty degrees, and the ends were filled in. The fire was made along the whole length of the house, and the gap between the poles at the top served for the chimney.

Between two and three hundred pounds of beef had come ashore and a great many onions; and the men were put upon rations to make the food last as long as possible. These rations were a quarter of a pound of beef and four onions per head per day. On December 11th the gale had gone down enough to allow the boat to go to the ship, and an endeavour was made to open the hatches, which were caked down with ice. All day was spent in the attempt, and on the next day the hold was got into. From the ship were taken two hundredweight of onions, a hundred-and-twenty-pound barrel of beef, a quarter-cask of potatoes, a bottle of oil, an axe, a large iron pot, two camp-kettles, twelve pounds of tallow candles, and three barrels of apples, shipped by a Jewish merchant at Quebec. These apples were indeed a welcome discovery.

The same night the aide-de-camp, when down at the beach, found a bundle of the ship's papers washed ashore. He opened them, and read to his astonishment that the St. Lawrence, though cleared for New York, was really bound for the West Indies. Her captain had intended to do a little privateering under the American flag, and her passengers had been saved from the trap by the leak and the wreck. Prenties read the papers through, and added them to the bundle he wore round his waist.

(To be continued.)

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER IV.—VANDERGAART KOPJE.

"I MUST be off," said Cyprien, as he dressed himself next morning. "I must leave Griqualand. After what that man said to me, to remain here a day would be weakness. He won't give me his daughter? Perhaps he is right. Anyhow, it will never do to look as if I wanted to plead extenuating circumstances. I must accept the verdict like a man, however painful it may be, and trust to the future to set things right."

And without further hesitation he began to stow away the apparatus in the packing-cases, which had served him for tables and cupboards. He worked with a will for an hour or so, and then through the open window came a sweet girlish voice, clear and full as the voice of the skylark:

'Tis the last rose of summer
Left blooming alone;
All her lovely companions
Are faded and gone.

He ran to the window and saw Alice on her way to the ostriches, with her

apron full of scraps for their food. She it was who was singing to the rising sun:

I'll not leave thee, thou lone one
To pine on the stem;
Since the lovely are sleeping,
Go sleep thou with them.

The young engineer was not particularly susceptible to poetical influences, but something in the song affected him deeply. He stood still at the window and listened intently.

The song ceased. Miss Watkins began to feed the ostriches, and as she did so it was pleasant to see the birds craning their long necks and dodging their huge awkward heads in front of her hand as she tantalisingly held out and withdrew the morsels of food. Then she finished her task, and as she returned resumed her song:

'Tis the last rose of summer
Left blooming alone;
All her lovely companions
Are faded and gone.

Cyprien was standing in the same place, with the tears welling up into his eyes, as if under a charm.

The voice grew more distant. Alice was within twenty yards of the farm, when the sound of hurried footsteps caused her to pause and turn round.

Cyprien, by an irresistible impulse, had left his hut, and was running after her bare-headed.

"Miss Watkins."

"Mr. Cyprien."

They were face to face in the full glow of the rising sun on the path that bordered the farm. Their shadows were thrown sharp and clear on the white wood of the palings. And now that Cyprien had reached Miss Watkins, he seemed astonished at what he had done and undecided what to say.

"You have something to say to me, Mr. Cyprien?" asked the lady, anxiously.

"I have come to bid you good-bye. I am going away to-day," was the answer.

The delicate rose tint which gave the life to Alice's face suddenly disappeared.

"Going away! You are going away? Where?" she asked tremblingly.

"Home—to France," replied Cyprien. "My work is done here. My mission has

disinterested, apart from the rest! you make me help you in your study and work! you open your heart to me, and make me share your hopes, your literary

"Going away!—You are going away?"

ended. I have nothing else to do in Griqualand. And I am obliged to get back to Paris."

This with a pause between each sentence, and as if he were craving pardon for some crime.

The girl was astounded. The news fell on her like a blow from a crowbar. Suddenly the teardrops showed themselves, and hung suspended on the long lashes which shaded her eyes. And then, as if recalled to the reality of the scene, she recovered herself, and said, with a slight smile,

"Going away! And you are going to run away from your scholar before she has finished her chemistry? You are going to leave me in oxygen and those mysteries of azote which were always a dead-letter for me? It is hardly the correct thing, sir."

She tried to put a good face on it, and to laugh it off, but the tone of her voice belied her words. Beneath her jesting there was a deep reproach which went straight to the young man's heart.

She continued, but the jesting tone was gone:

"And I? Do you think I am nothing? You quietly drop me back into chaos! You come here that I may see amongst all these Boers and greedy diggers a superior privileged being, learned, proud,

preferences, and your artistic tastes! you reveal to me the distance between a thinker such as you and the mere bimana that surround me! you encourage me to admire you and to like you! you nearly succeeded in doing so! Then you come and coolly tell me that it is all over, that you are off to Paris, and are in a hurry to forget me! And you think I am going to take it all as coolly as if I were a philosopher!"

Yes, he had done all that Alice with her tearful eyes had reproached him with.

"It is necessary that I do so! I yesterday asked your father to allow me to ask you to be my wife! He has refused, and gives me no hope! Now do you understand why I am going?" he was just about to say in defence, when the thought of his promise crossed his mind. He had promised John Watkins never to speak to his daughter on the subject of his dream, and he judged it dishonourable to break his word.

But at the same time he felt that his idea of immediate departure was brutally unkind. It seemed to him impossible to thus suddenly abandon the girl he loved, and who evidently—there could be no doubt of it—loved him. At first the thought of delay frightened him, then it seemed to him as imperatively necessary.

"When I spoke of going away, Miss Watkins," at last he said, "I did not mean this morning—nor to-day—nor—I have a few more notes to make—preparations to finish—Anyhow, I shall have the pleasure of seeing you again and—talking with you about—about—your studies!"

And then Cyprien abruptly turned away and ran off like a lunatic. He rushed into his hut, and throwing himself into an arm-chair, was immediately deep in thought.

And his thoughts were somewhat different from what they were before he spoke to Miss Watkins.

"Give her up because I have got no money!" he said to himself. "Knock under at the first blow! Is that the sort of man I am? Would it not be better to sacrifice a few prejudices and try and make myself worthy of her? How many fellows make their fortunes in a few months on the Diamond Fields? Why shouldn't I? Why shouldn't I turn up a hundred-carat diamond as the others have done; or better still, find a new field? Surely I have more theoretical and practical knowledge than most of these men? Why should not knowledge give me what work and luck give them? After all, I risk little in having a try. Even from this standpoint of my mission it would not do me any harm to take a turn with shovel and pick and gain some practical experience as a digger. And, if I succeed; if I become rich in this primitive way, who knows but what Watkins will yield, and reverse his decision? The prize is well worth the trial!"

And Cyprien began to walk up and down the laboratory, but his hands were still, his brain only was at work.

Suddenly he stopped, put on his hat, and walked out.

He took the path down to the flat, and at a great pace set out for Vandergaart Kopje.

In less than an hour he was there.

The miners were recrowding into the camp after their breakfast. Cyprien, as the bronzed visages passed by, was wondering to whom to apply for the information he wanted, when he recognised in one of the groups the honest face of Thomas Steel, the Lancashire miner. Two or three times had he met him since his arrival in Griqualand, and found that he was prospering, a fact sufficiently shown by his contented features, his brand new clothes, and the large leather belt round his waist.

Cyprien made up his mind to accost him, and tell him of his intention.

"Buy a claim? Nothing easier if you have got the money!" answered the miner. "There is one now close to mine. Four hundred pounds! It is giving it away! With half a dozen niggers to work for you, you'll make thirty pounds a week."

"But I haven't got four hundred pounds, and I don't possess a nigger!"

"Well, buy a share in a claim—an eighth or a sixteenth—and work it yourself! You can get one for forty pounds."

"That is more my figure," answered the engineer; "but you, Mr. Steel, how have you done, if I may be allowed to ask? Did you have any capital?"

"I got here with my arms and three sovereigns in my pocket," replied the Lancashire lad; "but I was lucky. I first worked half-shares with a man who

had an eighth. The fellow liked hanging about the liquor-shop better than working, and so we halved. I made some excellent finds, one a five-carat stone that we sold for two hundred pounds! Then I left off working for the first cove and bought a sixteenth for myself. As I only found small stones I got clear of that in ten days and went halves with an Australian on his claim. But we have hardly made a fiver this first week."

"If I found a share in a good claim that would not cost too much, will you go partners with me and work it?" asked the engineer.

"If you like," answered Steel; "but on one condition. That is, we each keep what we find. Not that I mistrust you, Mr. Cyprien. But you see, since I have been here I always lose when the sharing comes, for I am a good hand at the pickaxe and shovel, and I do about three times the work of the other fellows!"

"That seems fair enough," said Cyprien.

"Well, then here's an idea, perhaps a good 'un. Let us two take one of John Watkins's claims."

"One of his claims? I thought all the kopje belonged to him."

"So it does, but the Colonial Government, you know, lays hold of it as soon as it is declared a diamond field. He looks after it, measures it out, cuts up the claims, and keeps the best part of the price, and pays only a fixed royalty. And the royalty, when the kopje is as large as this one, amounts to something. But the freeholder always has the preference in buying back as many claims as he can work. That is the case with Watkins. He has got several going besides his property in the kopje. But he cannot work them as he ought to, for the gout stops him from coming down here, and I think he would let you have one cheap if you made an offer."

"I would rather you do the bargaining," said Cyprien.

"It makes no difference to me," replied Steel. "Just as you like."

Three hours later half-claim No. 942, duly marked out with stakes and identified on the plan, was handed over to Messrs. Cyprien and Steel for the sum of ninety pounds. It was expressly stipulated in the deed that the concessionaries should share the profits with John Watkins, and as a royalty hand him over the three first diamonds weighing more than ten carats that they should find. There was nothing to show that such a find was

likely to be made, but still it was possible—everything was possible.

On the whole the bargain was a good one for Cyprien, and Watkins, with his customary frankness, told him so as he signed the contract.

"You have acted like a sensible chap," said he, as he tapped Cyprien on the shoulder. "There is some stuff in you. I shouldn't be surprised if you turn out one of the luckiest diggers in Griqualand."

Cyprien could not but see in these words a happy augury for the future.

And Miss Watkins, who was present at

the interview, had she a look bright as sunshine in her blue eyes? No! Seemingly she had been crying all the morning.

By tacit consent nothing was said about the meeting early in the day. Cyprien was going to stay, that was evident.

The young engineer left with a light heart, and having made up his mind to visit the farm for the future only in his leisure moments, set to work to pack up a few of his things and take them down to his tent at Vandergaart Kopje.

(To be continued.)

"Buy a claim? Nothing is easier if you have the money!"

GREAT SHIPWRECKS OF THE WORLD.

THE BIRKENHEAD.

THE wreck of the Grosvenor recalls another disaster off the East African coast whose fame is world-wide and whose glorious story can boast of an honour never given before or since to a record of the sea, it having been read on parade at the head of every regiment in the Prussian service by order of the present Emperor of Germany as a lesson in discipline to his army, then, as now, the best disciplined army in the world. Truly a priceless tribute of admiration, all the more noteworthy as being unsought and unasked for.

The Birkenhead was an iron paddle-steamer built at Birkenhead by Mr. Laird

for a frigate and converted into a trooper. Towards the end of 1851 she sailed from the Cove of Cork for the Cape with reinforcements for the troops engaged in the Kaffir War. Her crew mustered one hundred and thirty all told; her troops, with their wives and families, numbered five hundred. The ship was under the command of Captain R. Salmond, and Colonel Seton, of the 75th Highlanders, was in charge of the soldiers, consisting of drafts of the 12th Lancers and of the 2nd, 6th, 12th, 43rd, 45th, 60th, 73rd, 74th, and 91st Regiments of the Line.

The Birkenhead had a very rough passage,

and was forty-seven days out when she reached Simon's Bay on February 23rd, 1852. After taking in three hundred and fifty tons of coal and sundry provisions, she proceeded on her voyage to Algoa Bay at six o'clock on the evening of the 28th.

At two o'clock in the morning she crashed on to an isolated rock below the water level off Point Danger. She was going eight knots an hour at the time, the night was clear, the sea was smooth except for the existence of a long swell, and the lead was going. A few seconds before she struck, the leadsmen on the paddle-box reported thirteen fathoms,

and while the lead was being cast again the catastrophe occurred. The cast was taken nevertheless, and though the bow was on the rock there were seven fathoms of water beneath her amidships and eleven under her stern. She was out of her course; instead of being ten miles from the shore, as supposed, she was only two and a half, and either a strong current had set in, such as affected the Rhadamanthus when she afterwards came in search, or her compasses had been touched by that peculiar disturbance which on the same night in the same latitude sent the binnacle compass of the Propontis half a dozen points to the westward.

The vessel began to fill. Captain Salmond rushed on deck and ordered the boats to be launched. Three of them only could be got safely afloat. The rest were swamped in launching, or stuck fast. The large paddle-box boats proved useless; the davit pins had rusted in and were immovable! Into the boats were put the women and children.

The ship was backed, and into the hole rushed the water, drowning many of the men in their berths. Again she struck, buckling her plates and breaking down her bulkheads.

The water burst into the engine-room, and the engineer and stokers had barely time to run up out of danger.

Everything was done to save the ship, but in vain. Discipline was never lost for a moment. The sailors went to the pumps to try and keep the water under, the soldiers were mustered by detachments on the deck, and went down with her to their watery graves as if merely on parade. The fore part of the ship sank first; then she broke up abaft the mainmast; the poop went last. The mainmast stood up above the waves, and to its topsail yard over forty men were afterwards found clinging.

At first no sound was heard but the voice of the commanding officers. In the last heave of the sinking ship the word was given, "Let all who can swim now try to save themselves." Some one said, "Make for the boats!" but another shouted that they would by so doing endanger the lives of the seventy-eight who were in them in safety, and no attempt of the sort was made. "The men went down as coolly as if embarking instead of going to the bottom."

The women, the children, and the sick were in the boats, keeping near the ship, and not daring to land owing to the forbidding nature of the beach. The horses had been thrown overboard, and five of them swam ashore in safety. Of the men, over two hundred were afloat on pieces of drift timber.

Captain Salmond was struck by the binnacle as he rose. Cornet Bond was sucked down by the poop as it sank, and, clearing himself, swam ashore, and caught his own horse as it trotted up out of the surf. A rough raft was thrown together, and on it nine men passed to the land in safety. Captain Wright was saved on a sponson. A few were saved on a paddle-box. One soldier was thirty-five hours floating about on a piece of timber.

The place was haunted by hundreds of sharks, and these feasted on the prey so suddenly crowding into their jaws. Those soldiers who were fully dressed escaped, those who had hurried up from below in different stages of night apparel fell easy victims. The shrieks from the crowded water were heartrending as man after man disappeared, dragged down by the furious brutes who revelled in the banquet.

Those who were saved made their way to the nearest house, that of Captain Smales, late 7th Dragoon Guards, and thence sent messages to the Governor. The boats at first made for the offing, and sighted a schooner. The schooner failed to notice them and kept on her way. Then one of the boats returned, and finding a creek along the beach, was there run ashore.

One of the other boats hoisted a woman's shawl. At last the schooner saw them. About

she went and bore down. She proved to be the Lioness, under Captain Ramsden, and ably was she handled, and well did she work. She picked up the two boats; she found the survivors clinging to the topsail-yard; she cruised about the scene of the wreck; and altogether she took on board no less than one hundred and sixteen. Seventy-eight escaped to the land, and thus the hundred and ninety-four survivors out of the six hundred and thirty troops and crew were accounted for.

There is no need to dwell upon sickening details. The fact remains that the sailors all did their duty as well as faulty machinery permitted them, and that the soldiers remembered their drill and faced death as gallantly as ever men faced it yet.

In the eloquent words of Sir Francis Hastings Doyle:—

"The stout ship Birkenhead lay hard and fast,
Caught without hope upon a hidden rock;
Her timbers thrilled as nerves, when through them
passed
The spirit of that shock.

"So calm the air, so calm and still the flood,
That low down in its blue translucent glass
We saw the great fierce fish, that thirst for blood,
Pass slowly, then repass.

"They tarried, the waves tarried for their prey!
The sea turned one clear smile! Like thing
asleep
Those dark shapes in the azure silence lay,
As quiet as the deep.

"Then amidst oath and prayer, and rush and wreck,
Faint screams, faint questions waiting no reply,
Our colonel gave the word, and on the deck
Formed us in line to die.

"To die!—'twas hard, while the sleek ocean glowed
Beneath a sky as fair as summer flowers;
'All to the boats!' cried one—he was, thank God,
No officer of ours.

"Our English hearts beat true—we would not stir;
That base appeal we heard, but heeded not.
On land, on sea, we had our colours, sir,
To keep without spot!

"They shall not say in England that we fought
With shameful strength, unhonoured life to seek;
Into mean safety, mean deserters, brought
By trampling down the weak.

"So we made women with their children go,
The oars ply back again, and yet again;
Whilst, inch by inch, the drowning ship sank low,
Still under steadfast men.

"What follows, why recall? The brave who died,
Died without finching in the bloody surf;
They sleep as well, beneath that purple tide,
As others under turf.

"They sleep as well! and, roused from their wild
grave,
Wearing their wounds like stars, shall rise again,
Oint heirs with Christ, because they bled to save
His weak ones, not in vain."

THE POULTRY RUN.—So far as our fowl runs are concerned, winter even in England may be said to commence this month. For the days are getting dark and short, and the nights proportionately cold and dreary. Far in the north, during the latter end of this month, if not before, we will have frost and snow, and everywhere there will be boisterous winds and wet. Well, we must be prepared for anything. We presume our poultry readers have already seen to all repairs, and that the fowl-house, while well ventilated, is perfectly watertight. Have a look to the inside fittings as well. Filthy, greasy perches are an abomination. Of slight importance though this matter may seem, it is never-

theless essential to the health and comfort of the fowls. We have known fowls to abandon slippery perches entirely, and roost on the ground, or on the edge of nest-boxes.

See to these nest-boxes, and be just as particular to keep them clean, and to keep clean straw in them, as you would be in summer. Beware of muck and filth, or wet on the floors. There is nothing to beat a cement floor for a fowl-house. Gravel is sometimes thrown in. It is too often thrown in to hide mess, and it is no disinfectant. If you really have not time to clean out the droppings twice or thrice a week, throw a shovelful of earth—preferably peat—over them, and clean out once a week.

A good shed, with a dust-bath over it, is a great comfort to fowls at this time of the year. Keep it always well filled with good dry garden mould, or peat earth, mixed with gravel and sand, and put

it down; now and then put a good handful of sulphur in it. Mind this; if your shed is not watertight your dust-bath becomes a mud one, or a damp one at least, and the fowls will not use it.

Now that the dark weather is coming on, we hope you have a lantern, cost tenpence, made of white iron, with three glass windows. Such a lantern will last for years, and is a great comfort. If you are going to build a new fowl-house, mind that is better than any other roofing.

We hope you have finished weeding out useless birds, or that any nondescripts you do possess will soon be cleared away, either to market or pot. Fatten by penning them separately, and feeding as often as they will eat on farinaceous food of all kinds, with milk and suet. But see that the latter does not affect the bowels. Feed laying hens extra well: they need meat, bullocks' lights, meaty scraps, etc., but not too much flour food, as this is fattening. Drooping fowls should be seen to. If white about the combs, put a rusty nail or two in the water. If they have any husky cough, and are weak in the legs, remove them to the warmth of a kitchen, or cellar with straw in it, and feed on nutritious diet. A few drops, say five, of paregoric and the same quantity of tincture of steel may be made into a ball with treacle and flour, and put over the throat twice a day. If in the cellar, manufacture some kind of low perch for them.

THE PIGEON LOFT.—The DOINGS for this month are neither many nor varied—that is, if all repairs, etc., have been seen to as we previously advised. If not, lose no time about it, so that your favourites may be healthy for the winter. In looking over our DOINGS for this time last year, we find we recommended the use of a hospital pen in case of sick birds. If you follow our advice, however, month after month, you will seldom be unlucky enough to have a tenant in your hospital. There are few more unsatisfactory patients than pigeons make. Ordinary birds had better be killed right off, but a valuable one should be given a chance. We sometimes get asked about a disease called *canker*. This is universally admitted to be an ailment brought on by overcrowding in filthy lofts. The trouble is infectious, so a thorough system of cleansing and quarantining should be adopted whenever it appears. It is seen in the throat as an ulcerous growth, or in the head or jaws, or in wattles of carriers, etc. We fear we can hardly recommend any cure with certainty, for the ailment is in the blood; but the diseased bird having been separated from the others, should have glycerine and iron in its water, be extra well fed, kept clean and warm, and have the sores touched twice a day with tincture of iodine, or a solution of nitrate of silver twenty grains to an ounce.

Garden pigeonries should now be planned. Plan them first on paper, count the cost, and determine what kind of birds you care to go in for. We will give further directions about this next month.

THE AVIARY.—The cold weather will soon be with us, if it be not so already in many parts. The change is often sudden. Those who keep many canaries ought to be weather-wise, and when the sun sets in a clear sky, and the stars shine out brightly thereafter, look out for frost, and cover up the cages at night. We would have you remember, though, that overwarmth, especially in stuffy rooms, is most detrimental to the health of canaries. You must study to keep up an equable temperature as far as possible. Mind, too, that you must never wholly cover up a cage. Leave breathing-room. We often get letters from boys in summer complaining that, though they have done everything we have suggested, still their attempts at breeding canaries have been failures. They should remember that the parents ought to be strong and lively. But they cannot be so if they have been kept all the weary winter in hot, close rooms. Such treatment is bound to debilitate them. So be warned in time.

We hope you thoroughly cleaned, disinfected, and dried your breeding-cages before you put them away, and that they are hanging in a clean place, and well covered up from dust.

Keep your birds clean. Give fresh water daily: no dainties, except now and then a morsel of sugar or sweet apple. But let the seeds be good, clean, and plain.

THE RABBITRY.—No animals need more snug quarters in the winter months than our bunnies. Damp is ruinous, bad bedding breeds disease and weakens the constitution.

We gave an excellent hint last year, which we hope has not been quite thrown away. We advised our readers to write out on a card the various kinds of food suitable for rabbits, and hang it where it could be seen. Do this, and do not forget to study variety in feeding. Beware of wet green food. Do not forget to let your rabbits have exercise if the weather is at all fine. You cannot be too careful now of the comfort of your stock. Such carefulness has its reward.

THE KENNEL.—Fleas in dogs are very troublesome. There is nothing like Persian insect-powder (Keating's) for dispersing them. But it must be used every day for a week out of doors, for the insects are not always killed—they go off. Wash twice a week, and let the bed be clean straw. Beware of what soap you use. A harsh alkaline soap always injures the skin. Give your dogs now plenty of exercise, and take plenty yourself, so should you both be able to defy coughs and colds during the coming winter months.

THE KITCHEN GARDEN.—The principal work now is making general repairs of every kind, and thoroughly trimming your borders and pathways. On fine days

clear up all rubbish, burn sticks and branches, and turn dead leaves into a heap. Dig ground. Take up and store beet and carrots. Earth up celery well. Prune hedges and trees, and plant fruit trees. Make everything tidy everywhere.

THE FLOWER GARDEN.—Plant bulbs and spring flowers of all kinds, lay out new borders, and see to old ones. Study chrysanthemum gardening this year, so as to be prepared next for a fine show of your own. They are splendid flowers, and turn winter almost into summer with their glorious appearance.

THE WINDOW GARDEN.—Evergreens must now take the place of flowers, and there are many very charming kinds. But now is the season to work in the shed making outside window-boxes, and covering them with tiles, cork, or bark. This last must be put on so as to well overlap, else the pieces shrink so much that portions of the box are left bare.

FISHING FOR THE MONTH.

NOVEMBER.

THE Chub—Chavender, Chevin, Loggerhead, or Skelly (query Scaly?), as the *Leuciscus cephalus* is variously termed—is another of the Cyprinidae or Carp family, of which I personally am very fond, and the capture of which is to me always an unalloyed pleasure. Various are the reasons for this—he is shy and yet bold, gross and greedy, and yet a lover of good things, not much good on the table, and yet a splendidly strong and courageous fish, taxing the resources of the angler to the utmost on fine tackle, and often coming off victor. My homily this month, therefore, will be upon our opprobriously named "Loggerhead," albeit, though broad-browed and large-mouthed, not by any means so ugly as the nickname would seem to imply.

The tackle you must have for this fish should be strong, but as fine as is consistent with that strength. A rather large, say No. 4 or 5 round bend, hook is the best size; and though the chub is so shy that if the shadow of a flying bird falls on the water he will probably dive at once, yet the hook need not be carefully covered up in the bait. A running line of fine silk twist is what is usually employed, and a stoutish quill float weighted with a few small shot at intervals completes the outfit. You will see that the chub-fisher's outfit is very simple for ordinary purposes. Fly-fishing for this fish I will explain presently. There is a great deal, however, in knowing how to use it, and what baits to employ. To give an idea of these subjects, let us first consider where the chub lives. What says Izaak Walton on this head?—let me tell you that his observations on the chub will hold good yet, and for some years to come. He says quaintly, "At yonder tree I shall catch a chub . . . Look you here, sir, do you see? (but you must stand very close) there lie upon the top of the water in this very hole twenty chubs." And this indicates, though briefly, the chief resting and basking-places of the fish. Under overhanging willows, in the deep holes by the side of clay banks which have been burrowed out by water-rats, near ancient edifices of camp sheathing, etc., the chub is always found, if the river produces him at all; but specially in the Thames at Walton, Chertsey, Staines, and other places is he to be found near the willows. As to baits, they are many, but easily obtainable. Cheese is a favourite dainty, and should be cut up into wedge-shaped pieces of three-eighths or half-inch size and then used. Select your "hunting-ground" and have some one with you in the boat—for a boat is very necessary—to hand you silently down from bough to bough as you desire.

Having arrived at the spot you wish to begin from, take a piece of the cheese in your mouth and chew it rapidly, blowing out the chewed portions into the water in front of you, that they may float down. These the voracious chub see and come out to take them, but it requires many such pieces to fill the capacious maw of the chevin. So to satisfy him you run the hook through a large piece, and letting the hook appear through, quietly let it fall into the water and draw onwards, being careful to put the float so that the bait is traversing mid-water. Onward glides the float, and presently, without any warning, down it goes. Oh, welcome sight! You strike, and out rushes with frantic haste the frightened chub. Be careful how you handle him, so that his great strength does not break your tackle. There is no fear of the hook breaking out, for the skin of the mouth is as tough as chamois leather; and after a fight more or less severe and prolonged, you eventually get him into the landing-net, perchance a beauty of three or even more pounds.

Pith and brains during this month are excellent baits also. This pith is the spinal marrow of the bullock, and the brains may be those of any animal—except of course your own, for you may want them, you know, at some future time—and the way to prepare both is as follows. For the pith, take it as you get it from your butcher, and drop it into boiling water, keeping it in some few minutes, then take it out and slip off the outer brown skin with a pair of scissors; roll the pith into brawn, and toss it about till cool, cut it up into pieces an inch long, and it is ready for the hook. The brains are simply boiled, and when cool are chopped up fine; a little oatmeal can be dusted in with them to aid their

disintegration when thrown in the water. They are for ground-bait. A red worm is also a capital bait, and I have seen some of the largest chub caught with a black slug. The inside is slit open, and the viscera exuded. The slug is then turned half inside out, so as to show the black-and-white of its back and inside. When this is used it is best to thread the bait on the gut, and draw it down on to the hook. It will be found nine times out of ten some inches up the line on unhooking the fish, owing to the latter's power of blowing anything out of its mouth. By-the-by, did you ever notice the way a fish does this? If not, look carefully at your goldfish the next time you feed them, and it will explain to you how some of your best bites are apparently missed, because the fish has instantly blown out the lure ere you could make the strike felt. The fish draws in a draught of water, and with it the bait; at this moment the gill-covers are closed, then when it wishes to expel by the mouth again the latter is opened, and a quick muscular movement of the gill-covers shoots the contents forward, oftentimes with really extraordinary velocity. This movement is quite worth noting by the young angler naturalist.

Artificial fly-fishing for chub is very pretty sport, but should be practised earlier in the year, say in August. I ought properly to have referred to it then, but better late than never. The flies chiefly favoured by the knowing ones are—to perpetrate an Irish "bull"—not flies at all, but the caterpillars of the *Arctia caja*, or tiger-moth. This is imitated in the following way. Black cocks' hackle ribbed with fine silver twist tied with black silk is the material. Let the tyro obtain one from the tackle-maker's, and he will at once see the method of tying it.

Do not be deterred from chub-fishing by the coldness of these autumn months; unless the thermometer indicates freezing-point—32°—there is nothing to fear in reference to the chub's appetite. The only thing is, you must select the deepest and quietest and most oily eddies, and be as quiet as a shadow. Talking will not influence your takes, but noisy and rough movements are fatal to it. "Study to be quiet" (1 Thess. iv. 11), that is the maxim with which that pious and good angler, Izaak Walton, finished his "Complete Angler" two hundred years ago.

OUR COMPETITIONS.

In reply to various correspondents, let us here say once for all that the rules must in all cases be strictly adhered to. The ages cannot be altered. Why, what manner of use would rules be if readers were allowed to break them if so minded? As regards the "Writing Competition," it was the Bible and not the Prayer-book version of the psalm intended; and the "style of handwriting" may be just that which each competitor thinks he can best excel in, provided always that it be plain—that is, clear and legible. The "1844" and "February 29" that appeared in a few copies were clearly misprints for 1884 and February 28th respectively. There were twenty-nine days in last February, but then next year is not Leap Year. In the fretwork competition, purchased designs are admissible, but original work is of course preferable. Inlaying may be combined with the carving; and the case may be finished off in any style the worker prefers.

J.—You can get plaster casts as drawing models from any of the educational apparatus sellers, and from Brucciani, Russell Street, Covent Garden, and any of the Italian image shops in Leather Lane and Gray's Inn Lane.

SWALLOW.—Apply direct to the authorities by whom the examination is held; never appeal to a newspaper when you can get your information as cheaply and more promptly at first hand.

B. P. B.—1. Bank post bills were first issued in the coaching days, when the mail was so frequently robbed. The idea was that if the holder lost the bill he would have time to stop its payment. They are as good as cash throughout the civilised world. 2. Bank notes never get out of date; they are always payable on demand. Nevertheless, the average life of a £5 note is only one week.

H. F.—The best time to sow hardy perennials, such as wallflowers, is in April or May.

FLORIST.—The simplest way to preserve cut flowers is to stick them in damp sand or charcoal, and every day to cut a slice off the end of the stem with a sharp knife. Never cut flowers with scissors, or break them off so as to compress the stalk. Flowers with their stems wrapped in wet cotton wool will also last a considerable time.

TELEGRAPH No. 4.—1. The most romantic story of the "Man in the Iron Mask" is that which makes him the twin brother of Louis XIV., but the general opinion is that he was Count Matthioli. Almost any encyclopedia will give you details. See No. 130, in the August part for 1881. 2. A man is always taller in the morning than when he goes tired to bed. When you are asleep you "stretch and grow." 3. Yes, the yeast plant. 4. Several of the Rosaceae have no bright colours in their blossoms. By a "rose" is meant the rose order, not necessarily the garden rose.

BROOKFIELD.—1. Perhaps Eton, with eight hundred boys. About a hundred a year. 2. There are many thousand square miles of forest land in America still unreclaimed. The Indians are fast disappearing. 3. See our "Thrones of the Ice King" in the fifth volume.

AMIGUS.—There are "Knowledge," price threepence; and "Nature," price sixpence, every week; and "Science Gossip," price fourpence; and "Science Monthly," price one shilling, every month. Do you mean natural science or physical science? Nearly every branch has its special organ.

SILVER CANYON.—What does St. Christopher do? Well, he protects you from unpleasant dreams, rescues you from flood, puts out your house when on fire, supports you during an earthquake, and, like a freely-advertised night-light, is the "burglars' horror" in defying robbery. If you have got the toothache, appeal to St. Blaise, who also makes a specialty of the quinsy and pleuro-pneumonia. If you have the ague, try St. Pernel, or St. Petronella; if neuralgia, try St. Apollonia; if you have bad eyes, try St. Clare—or spectacles; if you have a bad boil, inform St. Rooke; if you have the colic, St. Erasmus is the authority; if the gout, you should go to St. Wolfgang; if the leprosy, St. Lazarus; if the smallpox, St. Martin of Tours. Those who want riches should apply to St. Anne and St. Vincent; those who have lost their umbrellas should go to St. Ethelbert or St. Eilian, or—Scotland Yard. There were even saints credited with special powers as flea and beetle exterminators, such as St. Gertrude and St. Huldric. But, enough; to quote the absurdities of saint-worship is but slaying the slain. In an antiquarian sense, however, the facts are interesting. There is a long list of saints for diseases, patron saints of places, and patron saints of trades and professions, in Brewer's "Readers' Handbook."

E. VENNING.—The colours of the political parties really depend upon those of the candidates, or of the leading landowners of the district. As a rule the Conservatives wear blue and the Liberals yellow, but in many places the reverse is the case. So far from being surprised at receiving no answer, you may think yourself exceptionally lucky at having obtained one. The rule as to answering all letters does not obtain in journalism; it would be impossible to carry it out, as the letters are so multitudinous.

P. C.—In the February part for 1883 you will find a long list of coloured fires, and how to make them.

TRUE ENGLISH LAD.—If you go to Australia you must work. There is no more opening for a loiterer there than here, and the idea of earning a living at sport is not to be entertained.

E. E. A.—The highest peak of the Hindoo Kooosh cannot be given, because the mountains have not yet been measured. It probably exceeds twenty thousand feet.

MAPPER.—1. Johnston's Guinea Cosmographic Atlas might suit you. It has about seventy maps and plates. It is published at White Hart Street, Paternoster Row, and in Edinburgh. 2. A handbook to the culture of old-fashioned flowers and hardy perennials that require little attention is published by Gill, 170, Strand. It is by Mr. John Wood. 3. A "Handbook to South Australia by J. Stow" can be obtained from the Agent-General in Victoria Street. The "Official Handbook to New Zealand" costs a shilling, and is published by Stanford.

L. O. S.—The flying lichens are the Lecanore, known also as the Manna lichens. They grow with little adhesion to the soil, are collected by the wind, and swept away in great quantities in Northern and Western Asia and North Africa, and suddenly make their appearance as if from the clouds, falling like rain, and covering the ground to a depth of several inches. At one of the sieges of Herat the starving inhabitants were saved by a shower of the Lecanore which took place over the city; and in the Caspian famine, about fifty years ago, there was a great downfall of the Mannas. They are abundant in Central Asia, where the lichen is known as the "earth bread," and greedily eaten by man and beast; but, just as "baker's bread" contains occasionally too much phosphate of lime to be healthy, "earth bread" has frequently an overdose of lime oxalate. There is a flying lichen in Dorsetshire—the Farnelia.

RALPH.—If you want a smooth brass casting, dust your mould with flour or quicklime.

A. E. EARLS (Sydney).—1. As to the reason of the claim of the English kings to be Kings of France, consult any History of England that deals with the reign of Edward III. 2. You can get Pitman's Short-hand at Robertson's. 3. Make a perpetual calendar according to our instructions, and find the days for yourself. 4. You cannot restore the colour of the leather binding. It has not been properly dressed. If you were to use the inside of your Bible as much as the outside you would not have to send twelve thousand miles to inquire who Nimrod was.

TIGGY E. S.—1. *Guinea* is said to have been invented by Roger Bacon, by the monk Schwartz, by the Chinese, and by several other people, and you can take your choice. 2. It is not known when gold was first coined in this country, but the Britons had a gold coinage long previous to Caesar's invasion.

WOULD-BE POLITICIAN.—As the members enter the House after it is cleared, their names are ticked off on a printed list, those entering on one side being in favour of the motion, those entering on the other being against it.

NORFOLK DUMPLING.—We cannot work out algebraic problems in these columns. In Hall's Algebra, or Colenso's Algebra, you will find the rules you mention duly explained. In the last example as to the two digits, the answer is so obviously 23 that we wonder you did not find out the method by working backwards. Remember to multiply the leading digit by 10 when you state the equation. Find y in terms of x .

J. A. McE.—Read Lubbock's "Prehistoric Man," Fergusson's "Rude Stone Monuments," or call at the City Free Library at Guildhall, and consult any good encyclopedia, and work up the references at the end of the article. You will find the information in modern books under "temple," "cromlech," "dolmen," "monolith," etc. To call the stones Druidical is to beg the question; in nine cases out of ten there is nothing Druidical about them, unless you use the term Druid as descriptive of all the races who inhabited this country before the days of William the Conqueror.

H. P. CRUMP.—1. You can get virgin cork from Epps, Vauxhall Station, and from almost every nurseryman. 2. Try "Every Man his own Mechanic," now issuing in sixpenny monthly parts by Ward, Lock, and Co.

J. R. ROWLAND.—Write to Stanford, Charing Cross, or any other London publisher, for catalogue of his books.

M. L. W.—The "Ride to Aix" is purely imaginary. See the index to our third volume. Robert Browning was born in 1812 and is still living.

H. S.—The articles on bird-stuffing are not out of print. The names of the series are "The Boy's Own Museum" and "Waterson's Method." We know of no book at the price.

ONE OF SHEPHERD'S FLOCK.—1. Dew is caused by condensation of the air's moisture owing to the radiation of the earth's heat. Where the radiation is greatest the dew is heaviest, and hence the grass was wetter than the post. 2. Anybody can have a coat-of-arms by paying for it. The Herald's College is the Government department that attends to such matters, makes the search or invention, and extracts the fees.

T. A. SEARLE.—1. More stamp articles will appear in due course. 2. Postage-stamps were invented in England, and first used by our own Government.

HORNS.—1. You must apply to the slaughterers or fellmongers. Your butcher does not kill his own meat, therefore he cannot help you. Try Islington or Deptford. 2. No. 3. There is a workshop at King's College, where you could get practical instruction in carpentering. There is a private school where such classes are held at Syer's in Finsbury Street, E.C.

ORDINARY SEAMAN.—Order from any bookseller, price one shilling. "On Going to Sea, or Under the Red Ensign," by Mr. Thomas Gray. You will there find full particulars how to join the mercantile marine in any of the capacities you mention.

B. RAMANNA.—1. The cheapest way would be to get the parts from one of our Indian depôts. 2. For modern English you could not do better than read our better class newspapers and reviews. 3. A tricycle costs £23 at maker's list price. 4. The cost depends so much on the character of the individual.

H. TRENFIELD.—1. A mutilated Mulready envelope is worth from twopence to two guineas, the value depending on the state the envelope is in, and the state of the purchaser's mind and purse. It is impossible for such things to be definitely valued. 2. It costs nothing to learn to swim if you apply to the Charing Cross Baths; or to the secretary, London Swimming Club, Barbican, E.C.

G. R. T. W. MCC.—For particulars as to grafting pineapples on potato-runners we would advise you to consult some local specialist on mental diseases. A careful study of the lunacy laws of Buenos Ayres would be worth your while. It might decrease the postal revenue of that flourishing State, but it would keep you out of danger.

ROSE.—The best form of visiting card gives the Christian and surname in full, and the prefix Mr. The absence of the Mr. is of American origin, and is slowly coming into vogue. The neater the writing of the card the better. It should be printed from an engraved copper-plate, with as few turns and flourishes as possible. The address should be in a smaller character at the left-hand bottom corner.

J. G. W. ANGLER.—1. The fly depends on the locality and the day on which it is used. What will do on a dull day will not do on a bright one. 2. The thinner your gut and finer your tackle the more chance you will have of success; but the line must be strong enough to hold the fish when you have hooked him. 3. May.

G. K. O.—The "Commercial Code of Signals," and the "Mercantile Navy List," can be obtained from any nautical bookseller. Try Wilson, of the Minorities; Potter, of the Poultry, etc., etc.

No. 304.—Vol. VII.

SATURDAY, NOVEMBER 8, 1884.

Price One Penny.
[ALL RIGHTS RESERVED.]

JERRY'S VISIT, AND WHAT CAME OF IT.

BY

THE REV. H. C. ADAMS, M.A.,

Author of "Schoolboy Honour," "For James or George?" etc.

CHAPTER II.

JERRY followed Mr. Hampson up a Gothic staircase of polished oak, thickly carpeted and ornamented with a series of marble statues, to the first-floor, where his conductor tapped at one of the doors which extended in a double row along a spacious gallery, and received an order to enter. The next moment Jerry

"Charlie, feeling a new rider on his back, laid down his ears."—P. 103.

found himself inside a small but beautifully decorated room, where a lady and gentleman were sitting by the fire. They both rose, and the lady, after exchanging a few words with Hampson, came forward to where Jerry was standing, and, grasping him warmly by the hand, bent forward and kissed him two or three times. Jerry was at an age when boys are apt to dislike, or, at all events, to shrink awkwardly back from, such salutations. But he felt no such disposition on the present occasion. The lady, though past the *première jeunesse*, was both handsome and graceful, and the cordiality of her manner would have reconciled him to the caress, even had she wanted these attractions.

"My dear Jerry," she exclaimed, "it is such a happiness to me to see you at last."

Jerry was on the point of assuring her that it was through no disinclination on his part that they had not met long before, when he was interrupted by the gentleman, who exclaimed, in a tone of mingled surprise and vexation,

"Are you really Jerry Mannering?"

"If I am not," answered Jerry, surprised, and a little put out at the tone of the speaker, "I don't know who I am."

Jerry took a good look at his questioner as he spoke. Mr. Henry Mannering was a handsome man of, it might be, five-and-thirty, with dark-brown hair and eyes, and his face would have been very pleasing but for its sullen expression. He seemed about to make another remark in the same style as the first, when his sister interposed.

"Why shouldn't he be Jerry Mannering, Henry?" she asked. "Do you suppose Clara would send us a counterfeit! Jerry," she continued, anxious to divert matters into a pleasanter channel, "you must be hungry, though I hope you got luncheon before you started."

"Well, aunt," said Jerry, "I should like something to eat. I have had nothing since nine o'clock this morning."

"Poor boy, you must be famished! Tea has been laid out in the next room for you, but I'll tell Hawkins to bring you up something more substantial."

Jerry followed her into the next room, where a tea-table had been set out. But the tea-things were now removed, and the board spread with raised pie and cold partridge, together with some appetising accessories. Upon these viands Jerry fell to work with the healthy appetite of a schoolboy, and made such a meal as his memory never supplied the like of. Miss Mannering watched him for some time, and then went back to her brother in the boudoir. She found him pacing the room in a very dissatisfied frame of mind. He addressed her as she entered.

"Rose, I protest against this boy being taken into my father's room—at all events until he has been properly spoken to and told to hold his tongue. It will be at the risk of my father's life if it is done, and I will not allow it."

"There must be risk, of course, Henry," she answered, "risk any way. But Dr. Staines thinks there may be more risk in crossing papa than in the excitement of the interview. As for speaking to the boy, Hampson tells me he knows nothing of the unhappy differences that have arisen, and surely he had better remain in ignorance. You had better trust to my father's not referring to them."

"I don't think so," returned Mr. Mannering. "I don't think it will be safe or proper for the interview to take place. Early to-morrow I shall speak to Staines on the subject. If my father's life is to be endangered, I at least will do my best to prevent it. I wish you good night now."

Rosalie looked annoyed, but she made no reply. After sitting for a quarter of an hour lost in thought, she got up and went into the next room, where Jerry had now finished his repast.

"I suppose you will not be sorry to go to bed now," she said. "It is past ten o'clock, and you have had a tiring day."

"All right," said Jerry, "I am quite ready for bed, if you will show me where I am to sleep."

"I have had you put into the next room to mine," she said, "close by. Come with me and I will show you."

Jerry obeyed and was ushered into a bedroom as handsomely furnished as those he had already seen. There was an Arabian bedstead of polished brass, a Spanish mahogany wardrobe, and dressing-table. The room was carpeted in the centre, and the floor round it stained and polished. A bright fire was burning on the hearth, and in one corner a large bath stood ready for use.

The boy looked round him with a mixture of wonder and satisfaction. He felt something like the one-eyed calender in the castle of the hundred complaisant young ladies, and muttered to himself a regret that he had not long before made the acquaintance of so extremely desirable a relative. He was on the point of wishing Rosalie good night, when there came a knock at the door, and she was called out by a servant.

There was a whispered consultation in the passage, of which a few sentences reached Jerry's ears. "My master insists, ma'am," he heard the servant say. "I reasoned with him and prayed him, but it was no use." "But he must be undressed," Miss Mannering answered, "and in bed by this time. He ought to be, at all events." "No doubt, ma'am," was the answer; "but he wouldn't undress. He heard Master Jerome had come, and declared he would see him before he went to bed." "Won't he be satisfied if I promise to bring the boy as soon as Sir Jerome is up?" "I don't think it would be of the least use, miss. He only gets more angry the more you talk to him." "Very well, then, the boy must go. Return, and we will follow."

She re-entered the bedroom and told Jerry to put on his jacket again, which he had just taken off. "Your grandfather wants to see you at once," she said. "Come this way. Remember to speak out, and don't be afraid."

Once more the boy followed her as she traversed the whole length of the gallery, until they reached a door leading into a suite of apartments at the south-western corner of the house. Opening this, she exchanged a few words with some one, and then called to Jerry to enter.

He complied, and found himself in a larger and handsomer apartment than any he had yet seen. The walls were lined with bookcases of carved oak, and the spaces above them hung with pictures. In the centre of the soft Persian carpet was a large library-table strewn with books, magazines, and newspapers. Between it and the fire stood an invalid's chair, in which, half sitting, half re-

clining, appeared the figure of an elderly gentleman, wrapped in a warm dressing-gown, and having his legs swathed in flannel. His face and hands, and all of him that was visible, were attenuated by illness, or, it might be, by the waste of years. There was an angry flush on his face, and his eye no sooner lighted on Miss Mannering than he proceeded to discharge upon her the vials of his wrath, which, it was evident, were full to overflowing.

"What is the meaning of this, Rose?" he exclaimed. "Am I, or is some one else, to be master in this house? I desired that this boy might be brought, that I might see him at once. I have no doubt one glimpse of him will be enough, and I shall not be troubled any more about him. But see him I will, and at once—"

"He is here, sir," interposed Rosalie.

"Jerry, come forward."

"Here! Where?" exclaimed the baronet. "Hey! What! is this the lad? Really! you don't mean it! Come here, Jerry, and shake hands," he continued, looking with a mixture of astonishment and satisfaction at his young visitor. "Well, I can hardly believe it! My eyes and hair, I vow! and just such a look as I had when I came home from my first half at Eton! Well, this is a surprise!"

It may here be remarked that Sir Jerome's memory must have been somewhat affected, either by age or personal vanity, when he made these assertions, for although the colour of his eyes and his hair in the days of his youth might have resembled those of Jerry Mannering, there was no similarity of feature between them. Sir Jerome, however, was otherwise persuaded, and continued to give vent to his satisfaction.

"What on earth does Henry mean by telling me that the boy is a regular milksop, and an out-and-out Hartley? He hasn't got the trace of a Hartley about him! And I'll be bound he's no more of a milksop than I am! Surely you could run a mile, Jerry, couldn't you?"

"Run a mile!" repeated Jerry; "I should think so! Why, an old woman could do that! Our paper-chases take us sometimes a good three at a stretch!"

"And can play cricket and football?" pursued the baronet.

"We don't play at much else in our school," was the answer.

"And are not afraid to mount a pony?"

"Afraid! I should say not indeed!" shouted the boy. "I'm not such a muf as that, any way! Just you give me one, and see whether I won't put him over a hurdle or two, that's all!"

"And so you shall, my boy, so you shall!" cried the delighted baronet. "You shall have one to-morrow, and I'll have the hurdles put up on the lawn, and sit at the window to see you leap your pony over them. I suppose you get into scrapes at school sometimes, don't you, Jerry?"

"Sometimes," answered Jerry, demurely.

"Suppose you tell me one of them now, Jerry."

"Well, I don't mind—" began the lad. "My dear father," put in Rosalie, "you are exciting yourself too much; you are, indeed. Dr. Staines, you know, insisted on your being kept quiet. Jerry can come back to-morrow morning."

"I'll have it to-night, that's positive."

He may go as soon as he has told his story, but not before. Go on, my boy."

"Well," said Jerry, "I got into a scrape about a month ago. Bob Toller and Dick Raynes and I were out for a chivvy on Loxleigh Down, when we met a fellow with a terrier and a sack on his shoulder. Bob Toller knew him, and asked if he hadn't a badger in his bag. He said yes, and if we'd give him a shilling apiece he'd let us hunt him. We scraped together half-a-crown between us, and he turned the badger out. Wasn't it prime fun just! We chased him over the rocks, and through the ditches, for a good mile and a half, and caught him at last close

to Wreford Mill. Just as the badger and dog had pinned one another, up comes Poker Williamson—the second master, you know—we call him 'Poker' because he's so precious stiff. He asks us what we were about, and sends us home double-quick. But I don't think he'd have punished us if it hadn't happened just at that moment that Dick Raynes, who had been busy at the badger's tail, gave him such a prod that he let go the terrier and seized Williamson by the leg, just above the shoe, you know."

"Did he? Ha! ha! ha!" chuckled Sir Jerome. "I'd have given five pounds to see it. And what did you do?"

"We were all three in a fine fright, and cut for it as hard as we could. We could hear Williamson yelling half a mile off. Bill Raggett—that's the fellow with the badger—told us he had a toughish job to get the badger to let go, and the old Poker limped about, stiffer than ever, for a week to come. Raynes was swished, and we did double lessons for a week, but Williamson forgave us when his leg got well."

"To be sure he did. He couldn't help it. Well, Jerry, I suppose we must say good night now. But I'll remember about the pony to-morrow."

(To be continued.)

THE GREAT CANALS.

II.—PANAMA.

ON November 16, 1869, the Suez Canal was formally opened by De Lesseps's relative the Empress Eugenie; on September 4th of the following year the illustrious lady had to fly from Paris, and it was De Lesseps who assisted her to escape and accompanied her to England. After this brief relapse into politics, the great projector set to work on other mighty schemes—one of them the improvement of Algeria and Tunis by letting the Atlantic into the Sahara, the other another union of the oceans by cutting through the Isthmus of Panama. In the first matter little has yet been done, in the second a meeting took place at Paris in May, 1879, at which the route was chosen, and the canal is now being made.

It runs from Aspinwall to Panama, almost along the line which Balboa took when he crossed the isthmus and, wading to his waist into the Pacific, struck the wave with his sword and claimed the ocean for the King of Spain. There could not well be a greater contrast than that which exists between the Isthmus of Suez and that which connects the Americas. One is a mere sandy desert flat, the other abounds in hills and glades of luxuriant vegetation. "Clusters of crimson, white, and blue blossoms crown the trailing plants and orchids; parasites, marsh lilies, ferns, and purple-topped osiers grow together, forming a kind of floral paradise"—and "valley of the shadow of death," for where the plants abound most there hangs thickest the malaria cloud that sweeps off the labourers by the dozen.

Aspinwall or Colon—so-called after Christopher Colon, better known to the world under his Latinised name of Columbus, who landed there in 1502, ten years after his discovery of Watling Island on his first voyage, and five years after the Bristol men under the English-born Cabot had struck the mainland to the north—is, at present, a poor straggling town on a sandy beach with nothing remarkable about it but its dirt and shabbiness. Panama, on the Pacific side, is a town of a different stamp, though not now very flourishing. Familiar to us through the exploits of Francis Drake and of Morgan, D'Olonis and the buccaneers, to whom it afforded rare plunder, the old Spanish city, founded in 1593, has had an eventful history. Huge pieces of masonry and moss-clad columns scattered about its picturesque ruins tell of the high estate from which it has fallen, to revive again under the care of the canal which will enter the sea about a mile to the north of it.

The first to project a canal across the American isthmus was none other than Hernando Cortes, the conqueror of Mexico. He, however, instead of the Panama route, selected the one that even in these days has many supporters, that across the Mexican territory at Tehuantepec to the west of

Yucatan. Here the land is one hundred and forty miles across, more than double the width at Panama, though the greatest elevation that would have to be cut through would be 656 feet. This means a considerable increase of labour, and increased cost, to set against which, however, is the probability that sailing vessels as well as steamers would make much use of the road.

For the Lesseps canal will suit steamers only. Panama Bay is in the centre of the great belt of calms, and there is an entire absence of wind for weeks at a time. Instances are on record where ships have had to be towed for five hundred miles out to sea in search of a wind, and one, H.M.S. Herald, was actually taken seven hundred miles from land before she got a breeze! Of the persistence of these calms an eloquent story is told by the Galapagos Islands, where the domestic animals of the early colonists now run wild. Although within six hundred miles of Panama, and five hundred from the coast of South America, communication with them is cut off from the north and east, and they are now deserted. They lay quite out of the world, and not a breath of wind swept over them to waft a canoe to the mainland.

In addition to the calms there is to be taken into consideration the prevailing set of the wind. Going out to Australia through the Lesseps canal sailing vessels will have an easy time of it before a quartering breeze; but as to coming home! The journey will be a dead beat, and not a few seamen tell us that the clippers will get back soonest round the Horn. Even steamers, on account of the stiff strong breeze in their teeth, will have to go north about, pass the offings of Realejo, and run down the coast. There is a great difference between the straightest line on a globe and the shortest road at sea.

It is on account of these difficulties as to the calms and prevailing winds—and of another but trifling drawback, the excessive wet at Panama, where the rainfall is one hundred and twenty-four inches a year, and the wet months are nine or ten in number—that the Tehuantepec route is favoured, as by crossing so much farther to the west—nearly a thousand miles—the wind along the road would be brought round to a more workable angle.

Between Tehuantepec and Panama, however, is a third route, along which a canal will be open before very long. It is that favoured by the United States Government. The route is far enough north to avoid the difficulties of head winds and no winds, and although two hundred miles in length, runs for fifty-six and a half miles through a magnificent lake deep enough and large enough to take all the navies of the world. This is Lake Nicaragua, and out of it at Masaya, the so-called "Constantinople of the future of the New World," flows the River St. Juan,

which reaches the Atlantic after a course of one hundred and nineteen miles, and whose channel has to be cleared and rapids cut down to make it navigable throughout. Of the two hundred miles there are thus left very few for the canal proper, and about these there seems to be little difficulty. This Nicaragua canal will be a "locked" one, as that across Panama is to be, according to the latest advices.

The Lesseps canal, however, across the Darien Isthmus is that which now claims most attention. It leaves the Atlantic about a mile north of Colon, and skirting the Chagres river and the railway, crosses almost due south to Panama Bay. At times the river, the railway, and the canal run alongside of each other, as at Culebra, which is thirty-seven miles from Colon. This place is in the thickest of the malarious districts, but the scenery in the neighbourhood is singularly picturesque and diversified. At Buenavista we have another beautiful valley by no means improved by the canal works, which there seem in full swing, the great steam navy eating his way into the cliff in telling style. Buenavista is the principal centre for the mechanical appliances used on the works, and is a station of considerable importance. Gatoon, a little farther on, is another busy settlement. Work is being carried on all along the line, and on every hill and slope excavating, boring, blasting, and tunnelling are in progress. Gangs of labourers from fifty to three hundred in number are slicing the slopes into precipices or clearing the road for the waterway through the primeval forest in the valleys below. To Colon come the masses of machinery, which are all made in Belgium, sent out in segments, and here put together. Day and night the hammers ring and the forge fires glow. For the machinery required is enormous, and the work it has to do is no child's play. Colon has thus a charm of its own, though its inhabitants are a very miscellaneous lot, and chiefly consist of mere desperadoes, "the dregs of the Colombian States, who perpetrate crime without fear of punishment." The natives of the interior are, however, of different type, and are singularly inoffensive and affable—so long as they are unmolested.

How long the canal will take to make is somewhat doubtful, but it is officially announced to be open "in two years' time." Like most other great works, it is principally a question of finance. Given the money, we get the men; and given the men, we get the work. De Lesseps at present leads the way across the isthmus, but he has five competitors all anxious to excel or hinder him. First there is the company under the patronage of the United States Government with the Nicaragua route, then come the Tehuantepec projectors, then the shallow-water canal people, who recommend hoisting the ships on to

pontoons and towing them over on a dry dock. The fifth scheme for joining the seas is that of the railway with the huge aquarium in which the vessels are to float; the sixth the "ship railway" of Captain Eads, in which the vessel is to be shored up on a "cradle

truck" and dragged along by locomotives hooked on around it—a scheme startling enough but not very novel, it having been introduced over here some twenty years ago by the Honduras minister. While others are talking, however, De Lesseps is working, and

despite the unexpected difficulties, financial, political, and technical, is making steady progress, and bids fair to keep his word and open the Panama Canal in 1886.

(THE END.)

THE STAR OF THE SOUTH

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER V.—THE DIGGERS AT WORK.

THE next morning the two partners set to work. Their claim was near the boundary of the Kopje, and, if Cyprien's theory was correct, ought to prove a very rich one. Unfortunately, the claim had already been overhauled, and had been driven down into for a hundred and fifty feet or more.

In one respect this was an advantage, as its owners, by finding themselves below the level of the neighbouring claims, were

men cut away a certain quantity of earth from the mass. That done, one of them went to the surface and hauled up along the wire rope the bucketsful sent him from below.

This earth was then taken in a cart to Steel's hut, and there, after being crushed with wooden billets, so as to clear away the worthless pebbles, was passed through a fine sieve and separated from the tiniest stones, which were all carefully picked

When it had been turned out on to the table, the two diggers sat down, and, armed with a sort of scraper made out of a piece of tin, went over it carefully, handful by handful, and then threw it under the table, whence, when the examination was over, it was taken and thrown away as rubbish.

All this was to find out if it contained any diamonds, no matter how small. The partners thought themselves very lucky when the day had gone if they had found but one solitary specimen. They worked with great eagerness, and minutely tried through the earth, but during the earlier days the results were almost negative.

Cyprien seemed to stand no chance whatever. If a tiny diamond was found in the earth it was always Steel who noticed it. The first one he found did not weigh, gangue and all, more than the sixth of a carat.

The carat is a weight of four grains. A diamond of the first water—that is to say, pure, limpid, and colourless—is worth, once it is cut, about ten pounds if it weighs a carat. But if smaller, diamonds are very much less valuable in proportion. Larger ones increase in value at a very rapid rate. Generally speaking, a stone of pure water is equal to the square of its weight in carats multiplied by the current price per carat. Thus if the price per carat is ten pounds, a stone of the same quality weighing ten carats would be worth a thousand pounds.

But stones of ten carats, and even of one carat, are very rare, and that is why they are so dear. And, besides, the Griqualand diamonds are nearly always yellowish in colour, and that greatly detracts from their value in jewellery.

The finding of a stone weighing the sixth of a carat, after seven or eight days' work, was a very poor return for the trouble it had cost. At that rate it would pay better to go out and dig, to look after sheep, or to break stones on the road. So thought Cyprien to himself. But the hope of coming across a splendid diamond, which would pay them at one stroke for the work of many weeks, or perhaps of many months, sustained him as it sustained all the other miners, even those least sanguine. Steel worked like a machine, and did not think at all—at least, he did not seem to do so.

The partners generally breakfasted together, contenting themselves with sandwiches brought from a bar close by; but they dined at one of the numerous ordinaries, like the rest of those in camp.

"Hauled up along the wire rope."

entitled, by the custom of the country, to all the earth and all the diamonds that fell into it.

The proceedings were very simple. By means of the shovel and pickaxe the two

over before being rejected. Then the earth was sifted through a still finer sieve to get rid of the dust, and then it was in a fit condition to be looked over for the diamonds.

The evenings they spent apart, Cyprien generally visiting the farm for an hour or two.

There he frequently had the disagreeable necessity of meeting his rival, James Hilton, a large man with red hair and freckled face. This rival was evidently making great progress in the esteem of John Watkins by dint of drinking more gin and smoking more tobacco than he did himself.

Alice, it is true, seemed to have the most perfect contempt for the clownish manners and commonplace conversation of young Hilton. But his presence was simply insupportable to Cyprien, who could not stand him at any price, and consequently took his departure, and left the field clear for him.

"The Frenchman is not satisfied!" Watkins would say to his companion, giving him a wink. "It seems that diamonds don't come by themselves into the shovel;" and Hilton would laugh loudly at the joke.

Often on these occasions Cyprien would finish his evenings with an old Boer living near the camp, whose name was Jacobus Vandergaart.

It was from him that the Kopje took its name, for he had been the freeholder in the early days of the concession. But, if he was to be believed, he was, by some gross piece of injustice, dispossessed in favour of Watkins. Now he was completely ruined, and lived in an old mud hut, earning a living by diamond-cutting—a trade he had formerly followed in his native town of Amsterdam.

It often happened that the diggers, curious to know the exact weights that their diamonds would be once they were cut, would bring them to him sometimes to cleave them, sometimes to submit them to more delicate operations. But this work required a sure hand and keen eyesight, and old Jacobus Vandergaart, excellent workman though he had been in his time, had now great trouble in executing his orders. Cyprien had given him his first diamond to mount in a ring, and had immediately taken a fancy to him. He liked to come and sit in his

humble workshop and have a chat, sometimes even merely to keep him company

and long nose, surmounted by a pair of round spectacles, looked like an alchemist

"Sifted through a fine sieve to get rid of the dust."

while he worked at his lapidary's wheel. Jacobus Vandergaart, with his white beard, bald head, and black velvet cap,

of the fifteenth century seated among his quaint old tools and acid flacons.

(To be continued.)

GREAT AFRICAN EXPLORERS.

SIR SAMUEL BAKER.

AT Gondokoro, as we have seen, Speke and Grant met Mr. and Mrs. Baker on their way to the south in search of those headwaters of the Nile, the principal of which they had been so fortunate as to discover. Baker was not the first to attack the problem from its northern side, but he was the first to succeed. He had arrived at Korosko in April, 1861, crossed the desert on camels, and left Berber in June on a preliminary exploration in Abyssinia among the tributaries of the mighty river. Arriving at the junction of the Great Atbara with the Nile, he found the bed of that affluent almost dry, but a week afterwards, while camped on its bank, there came a sound as of thunder in the night, and the water spread itself over the glittering mud, and gradually rose until the full width was reached. Then he went on to Cassala, and, hunting and exploring, moved

about from one subsidiary stream to another for nearly two years, making great friends with the Hamran Arabs, those extraordinary Nimrods who hunt and kill wild animals of every sort, from the antelope to the elephant, with no other weapon than the sword, and who defend themselves with oval and circular shields of rhinoceros hide or the almost equally tough skin of the giraffe. The average sword of these gallant hunters is a yard long, and has a five-and-a-half-inch hilt and a blade of nearly two inches across, almost as sharp as a razor. With no knowledge of swordsmanship, they never parry with the blade, but trust entirely to the shield, and content themselves with slashing either at their adversary or at the animal he rides. "One good cut delivered by a powerful arm would sever a man at the waist like a carrot."

Of the extraordinary bravery and address of these Arab hunters Sir Samuel's book on "The Nile Tributaries of Abyssinia" is full. The description of one of the elephant hunts may serve as an example. "The three aggaegers came galloping across the sand like greyhounds, and, judiciously keeping parallel with the jungle, cut off the elephant's retreat, and confronted him sword in hand. At once the furious beast charged straight at the enemy, but instead of leading the elephant by the flight of one man and horse, according to their usual method, all the aggaegers at the same moment sprang from their saddles, and upon foot in the heavy sand attacked the elephant with their swords. No gladiatorial exhibition in the Roman arena could have surpassed this fight. The elephant was mad with rage, and nevertheless he seemed to know that the object of the hunters was

to get behind him. This he avoided with great dexterity, turning as it were upon a pivot with extreme quickness, and charging headlong, first at one and then at another of his assailants, while he blew clouds of sand in the air with his trunk, and screamed with fury. Nimble as monkeys, nevertheless the agageers could not get behind him. The depth of the loose sand was in favour of the elephant, and was so much against the men that they avoided his charges with extreme difficulty. It was only by the determined pluck of all three that they alternately saved each other, as two invariably dashed in at the flanks when the animal charged the third."

Of course the elephant was killed. Here is a description of a rhinoceros hunt even more graphic and exciting. "The two rhinoceros were running neck-and-neck like a pair of horses in harness but bounding along at tremendous speed within ten yards of the leading Hamran. This was Taher Sheriff, who, with his sword drawn, and his long hair flying wildly behind him, urged his horse forward in the race, amidst a cloud

like claw that was all that remained of a hand, but with his naked sword grasped in his right, he kept close to his brother, ready to second his blow. Abou Do was third, his hair flying in the wind, his heels dashing against the flanks of his horse, to which he shouted in his excitement to urge him to the front, while he leant forward with his long sword in the wild energy of the moment, as though hoping to reach the game against all possibility. I soon found myself in the ruck of men, horses, and drawn swords. There were seven of us, and passing Abou Do, whose face wore an expression of agony at finding that his horse was failing, I quickly obtained a place between the brothers. The horses were pressed to the utmost, but we had already run about two miles, and the game showed no signs of giving in. On they flew—sometimes over open ground, then through low bush, which tried the horses severely; then through strips of open forest, until at length the party began to tail off and only a select few kept their places. Only four of the seven remained, and we swept down an incline, Taher Sheriff still leading

he ran like an antelope for the first hundred yards. I thought he would really pass us and

Lady Baker.

Sir Samuel Baker on the march.

of dust raised by the two huge but active beasts, that tried every sinew of the horses. Roder Sheriff, with the withered arm, was second; with the reins hung upon the hawk-

and Abou Do the last! His horse was done, but not the rider; for, springing to the ground while at full speed, sword in hand, he forsook his tired horse, and, preferring his own legs,

win the honour of the first blow. It was of no use; the pace was too severe, and, although running wonderfully, he was obliged to give way to the horses. Only three now followed the rhinoceros—Taher Sheriff, his brother Roder, and myself. I had been obliged to give the second place to Roder, as he was a mere monkey in weight, but I was a close third. The excitement was intense. We neared the jungle, and the rhinoceros began to show signs of flagging, as the dirt puffed up before their nostrils, and with noses close to the ground, they snorted as they still galloped on. Oh, for a fresh horse! 'A horse! a horse! my kingdom for a horse!' We were within two hundred yards of the jungle, but the horses were all done. Tetel reeled as I urged him forward. Roder pushed ahead; we were close to the dense thorns, and the rhinoceros broke into a trot; they were done! 'Now, Taher, for-r-a-a-r-r-d! For-r-r-a-a-r-d, Taher!!' Away he went; he was close to the very heels of the beasts, but his horse could do no more than his present pace. Still he gained upon the nearest; he leaned forward with his sword raised for the blow—another moment, and the jungle would be reached! One effort more, and the sword flashed in the sunshine as the rearmost rhinoceros disappeared in the thick screen of thorns with a gash about a foot long upon his hind quarters."

Amid many stirring adventures such as this, among elephants, lions, crocodiles, hippos, antelopes, giraffes, etc., etc., Baker carried on his observations, and familiarised himself with the Arab language and customs, returning to Khartoum in June, 1863. He had visited the seven streams of Abyssinia—the Atbara, Seltite, Salaam, Angareb, Rahad, Dindu, and Bahr-el-Azrek—and solved the secret of the rising by showing that the river receives its steady flow of water from the central lakes, while the flood waters that cause the overflow pour in almost exclusively from these streams that rise in the Abyssinian highlands.

After a long delay at Khartoum the explorer and his wife started for the south, and at Gondokoro were the first Europeans to welcome Speke and Grant. Obtaining copies of their maps and much valuable information, the Bakers pushed on, and notwithstanding their mutinous following, and many difficulties with Ibrahim, the ivory (or rather slave) trader, and others, succeeded in reaching Kamrasi's capital at Mrooli. At Kamrasi's they had a long detention, and they only quitted that designing monarch after he

had exhausted every device to prevent their advance. Unyoro was fraught to them with anything but pleasant memories. Perhaps the calamity which befell them as soon as they had got rid of the king had better be left for Sir Samuel himself to describe. He says in his "Albert Nyanza":—"On the following morning we had the usual difficulty in collecting porters, those of the preceding day having absconded, and others were recruited from distant villages by the native escort, who enjoyed the excuse of hunting for porters, as it gave them an opportunity of foraging throughout the neighbourhood. During this time we had to wait till the sun was high, and we thus lost the cool hours of morning and increased our fatigue. Having at length started, we arrived in the afternoon at the Kafoor river, at a bend from the south where it was necessary to cross over in a westerly course. The stream was in the centre of a marsh, and although deep, it was so covered with thickly matted water-grass and other aquatic plants that a natural floating bridge was established by a carpet of weeds about two feet thick. Upon this waving and unsteady surface the men ran quickly across, sinking merely to the ankles, although beneath the tough vegetation there was deep water. It was equally impossible to ride or to be carried over this treacherous surface; thus I led the way, and begged Mrs. Baker to follow me on foot as quickly as possible, precisely in my track. The river was about eighty yards wide, and I had scarcely completed a fourth of the distance, and looked back to see if my wife followed close to me, when I was horrified to see her standing in one spot and sinking gradually through the weeds, while her face was distorted and perfectly purple. Almost as soon as I perceived her, she fell, as though shot dead. In an instant I was by her side, and with the assistance of eight or ten of my men, who were fortunately close to me, I dragged her like a corpse through the yielding vegetation, and up to our waists we scrambled across to the other side, just keeping her head above water. To have carried her would have been impossible, as we should all have sunk together through the weeds. I laid her under a tree and bathed her head and face with water, as for the moment I thought she had fainted; but she lay perfectly insensible as though dead, with teeth and hands firmly clenched, and her eyes open but fixed. It was a sunstroke.

"Many of the porters had gone on ahead with the baggage, and I started off a man in haste to recall our angarep upon which to carry her, and also for a bag with a change of clothes, as we had dragged her through the river. It was in vain that I rubbed her heart, and the black women rubbed her feet, to endeavour to restore animation. At length the litter came, and after changing her clothes she was carried mournfully forward as a corpse. Constantly we had to halt and support her head, as a painful rattling in her throat betokened suffocation. At length we reached a village, and halted for the night.

"I laid her carefully in a miserable hut, and watched beside her. I opened her clenched teeth with a small wooden wedge, and inserted a wet rag, upon which I dropped water to moisten her tongue, which was dry as fur. The unfeeling brutes that composed the native escort were yelling and dancing as though all were well; and I ordered their chief at once to return with them to Kamrasi, as I would travel with them no longer. At first they refused to return; until at length I vowed that I would fire into them should they accompany us on the following morning. Day broke, and it was a relief to have got rid of the brutal escort. They had departed, and I had now my own men, and the guides supplied by Kamrasi.

"There was nothing to eat in this spot. My wife had never stirred since she fell by the sunstroke, and merely respired about five times in a minute. It was impossible to

remain; the people would have starved. She was laid gently upon her litter, and we started forward on our funeral course. I was ill and broken-hearted, and I followed by her side through the long day's march over wild park-lands and streams, with thick forest and deep marshy bottoms; over undulating hills, and through valleys of tall papyrus rushes, which, as we brushed through them on our melancholy way, waved over the litter like the black plumes of a hearse. We halted at a village, and again the night was passed in watching. I was wet and coated with mud from the swampy marsh, and shivered with age; but the cold within was greater than all. No change had taken place; she had never moved. I had plenty of fat, and I made four balls of about half a pound, each of which would burn for three hours. A piece of a broken water-jar formed a lamp, several pieces of rag serving for wicks. So in solitude the still calm night passed away as I sat by her side and watched. In the drawn and distorted features that lay before me I could hardly trace the same face that for years had been my comfort through all the difficulties and dangers of my path. Was she to die? Was so terrible a sacrifice to be the result of my selfish exile?

"Again the night passed away. Once more the march; though weak and ill, and for two nights without a moment's sleep, I felt no fatigue, but mechanically followed by the side of the litter as though in a dream. The same wild country, diversified with marsh and forest. Again we halted. The night came, and I sat by her side in a miserable hut, with the feeble lamp flickering while she lay as in death. She had never moved a muscle since she fell. My people slept. I was alone, and no sound broke the stillness of the night. The ears ached at the utter silence, till the sudden wild cry of a hyena made me shudder as the horrible thought rushed through my brain, that, should she be buried in this lonely spot, the hyena would—disturb her rest.

"The morning was not far distant, it was past four o'clock. I had passed the night in replacing wet cloths upon her head and moistening her lips as she lay apparently lifeless on her litter. I could do nothing more; in solitude and abject misery in that dark hour, in a country of savage heathens, thousands of miles away from a Christian land, I beseeched an aid above all human, trusting alone to Him.

"The morning broke; my lamp had just burnt out, and, cramped with the night's watching, I rose from my low seat, and seeing that she lay in the same unaltered state, I went to the door of the hut to breathe one gasp of the fresh morning air. I was watching the first red streak that heralded the rising sun, when I was startled by the words "Thank God" faintly uttered behind me. Suddenly she had awoke from her torpor, and with a heart overflowing I went to her bedside. Her eyes were full of madness. She spoke, but the brain was gone.

"I will not inflict a description of the terrible trial of seven days of brain fever, with its attendant horrors. The rain poured in torrents, and day after day we were forced to remain in one position. Every now and then we shot a few guinea-fowl, but rarely; there was no game, although the country was most favourable. In the forests we procured wild honey, but the deserted villages contained no supplies, as we were on the frontier of Uganda, and M'tese's people had plundered the district. For seven nights I had not slept, and although as weak as a reed, I had marched by the side of her litter. Nature could resist no longer. We reached a village one evening; she had been in violent convulsions successively—it was all but over. I laid her down on her litter within a hut; covered her with a Scotch plaid, and I fell upon my mat insensible, worn out with sorrow and fatigue. My men put a new

handle to the pickaxe that evening, and sought for a dry spot to dig her grave!

"The sun had risen when I awoke. I had slept, and, horrified as the idea flashed upon me that she must be dead, and that I had not been with her, I started up. She lay upon her bed, pale as marble, and with that calm serenity that the features assume when the cares of life no longer act upon the mind, and the body rests in death. The dreadful thought bowed me down; but as I gazed upon her in fear her chest gently heaved, not with the convulsive throbs of fever, but naturally. She was asleep; and when at a sudden noise she opened her eyes, they were calm and clear. She was saved!"

Soon afterwards they reached Parkani, and on 14th March, 1864, Baker sighted the lake he was in search of, shining like a sea of quicksilver, with the blue mountains hazily bounding it some sixty miles away. Descending to the lake side, Baker drank some of the water, and gave the vast inland basin the name of the Albert Nyanza. In a large canoe six-and-twenty feet long, hollowed out of a single tree, a cruise of a fortnight's duration took them to Magungo, where the Somerset, or Victoria Nile, runs in from the other lake, and this river was ascended until the Murchison Falls and other cataracts were duly visited and surveyed, and the origin and course of the stream placed beyond a doubt. The return journey was soon after commenced, and Kamrasi's obstacles being again overcome, the expedition got safely back to Gondokoro, and thence home, where a knighthood and other honours were bestowed on its leader.

In 1869 Sir Samuel Baker was appointed to the command of the expedition fitted out by the Khedive Ismail to abolish the slave trade by annexing the Soudan—an annexation that was to produce some very unexpected results. With six steamers, built in sections, and sixteen hundred Egyptian troops, Baker arrived at Khartoum in 1870, and advancing up the Giraffe had to set to work to cut a passage through the "sudd," that dense mass of drifting vegetation which bars the course of the river, and gives those horrible treeless swamps swarming with mosquitos and every tropical insect, and affording a refuge for elephants, lions, hippos, and crocodiles by the score. Two months were passed in getting through the obstruction to the channel of the White Nile, and then a dam had to be built to float the fleet, a dam made of fascines and corn sacks filled with sand, whose construction was frequently interrupted by the attacks of the larger game. Gondokoro was reached at last, and then followed a war with the Bari, and a successful campaign, marked by the disgraceful conduct of the troops, carried on under great difficulties. The advance was made to Lobore, the site of the future great city of Central Africa at the beginning of the lakes; and, in fact, the Soudan was annexed as had been planned.

Baker was succeeded by Gordon, as related in our June part, and under his energetic rule steamers ascended the Nile and navigated the Albert Nyanza, while his representatives made their way south as far as King M'tesa's court. On Stanley's arrival during his voyage in the Lady Alice, detailed at such length in our October part for 1879, he there met with Bellefonds, who had been sent down by Gordon from the north.

Stanley was not the first to cross Africa from Zanzibar to the Atlantic. That honour is claimed by Cameron, who in 1873 headed the Geographical Society's expedition in search of Dr. Livingstone, and who, finding that the doctor had died, boldly struck out for the west coast, and after carefully surveying Tanganyika and doing other good work, discovering Lake Mohyra with its curious villages of pile dwellings, and triumphing over hosts of obstacles and heart-breaking delays, emerged once more into civilisation after an absence of over three years on the journey.

SUNDAY.

CHICK MINOR'S HATS.

AT "our school" (and of course other schools were of no importance) we had a strict ordinance on the subject of hats. Whenever we went into the town, or in fact outside school precincts, we had to don the college cap, better known as the mortar-board. Sunday was the only day excepted from the rule, then tall silk hats were *de rigueur*, though we did not call them "cat-skins," as in "Tom Brown," but "boxers."

Now a hat that is only worn once a week will last a long time, and as some boys, to save the trouble of taking an unpackable hat home at holiday time, used to leave it behind to do for next half, it can be easily imagined that the variety exhibited in the long procession of boys was great if not charming. Fashion was not regarded except by a few of the bigger boys, who always brought back new boxers in an astonishing state of glossi-

ness, however, was not in much favour, as it gave a peculiar gloss which was compared to the trail left by a slug.

Chick Minor's hat was one of the most celebrated tiles of our school. He was a short fat boy with a head like a football. When his brother left school he persuaded him to transfer to him his boxer as a legacy. It did not fit Chick Minor well, being too large, but that difficulty was overcome by the insertion of paper collars inside the leather lining. When the hat was made broad brims were the fashion, but when Chick Minor obtained possession of his legacy brims were narrow. The consequence was that he looked like "a snail under a cabbage-leaf," as Wilson facetiously remarked. But Chick Minor grinned, and did not mind so long as the matron did not object, and she was only too pleased to find that his hat was presentable as regards nap. Details of fashion were beyond her ken.

But his "topper" was not the best known of his head-coverings, for it was seen but once a week, whilst his others were constantly within sight. He possessed, of course, the regulation mortar-board, and in addition a straw hat for use in the playground. It was the end of July when we came back to school, and the summer was usually at its height. A straw hat was therefore very convenient; but then summer did not last for ever, so straw hats became rather cool as the half progressed.

Not that Chick Minor's straw outlasted the hot weather. Being a junior boy he had to hang up his hat on one of a row of pegs in a recess at the end of the long schoolroom. It was more than could be expected that boys would refrain from making "cockshies" at such a tempting object. It was gorgeous to put a fives ball well into the crown; the pleasure was so great that Chick Minor himself could not always refrain.

Then egg-cap was a favourite game of the lower school, and as they played it in all weathers it told on the appearance of the straw. But the hat was a stout one, and the first real damage to it was caused by a match between its owner and Bates as to who could make his hat skim farthest. Bates operated with a disused mortar-board, Chick with his straw. The brim gave way and separated itself from the rest of the hat for a considerable distance.

That was a nuisance, as the loose brim flapped up and down in a most uncomfortable way. So to mend matters he cut it clean away.

Then came a terribly hot day, and he found that a brimless hat did not shade his eyes. The happy thought then struck him to wear the brim without the hat. This answered admirably, though he came near having a sunstroke.

He never knew when the top of the crown of his hat became split, but it did. The split grew gradually larger till the attaching hinge was but an inch or so long. However, gravitation kept it on his head when he was at rest, but if he ran against the wind the crown would rise and impede his progress. So one day he cut it off as a nuisance.

There was not much left of his hat now. The brim and the crown were gone; nothing remained but the upright circle surrounding his head. This he stuck to for some time till a mishap occurred.

He used frequently to dispense with a hat altogether, looking upon his ruined straw as more ornamental than useful. It happened, however, one day, that he put it on and forgot all about it. When the school bell rang he walked tranquilly to his place with the circle still round his brows.

This occasioned some remarks from the

YE
STRAW.

master and a stoppage of pocket-money till a new hat was procured. But Chick Minor was equal to the occasion. He made his mortar-board his everyday hat, and appealed to the matron for a new mortar-board, to be charged for in the bill at the end of the half. As it was quite time he had a new hat for the town the matron consented.

His mortar-board lasted him till the holidays, for there is a great deal of wear in mortar-boards. The tassel may come off and the corners become as dog-eared as a school dictionary, but the top and bottom hang together in spite of almost any usage. So Chick Minor saved his pocket-money and brought back with him after Christmas a fur cap which defied ill-usage!

ness. Most of the fellows did not care two straws what fashion was in, and sported tiles which had died the death a year before.

Unfortunately a "boxer" offers considerable temptation to a boy in search of mischief. It is so easily knocked off and rolls about so splendidly, affording endless opportunities for kicking. So it is perhaps hardly to be wondered at that some hats required considerable brushing before they were fit to take to church. On Sunday mornings the lavatory generally contained a dozen youngsters diligently trying to impart a superior shininess to their hats with the aid of water, or even soap and water. This latter plan,

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER IX.

"Ah, you thief! I've caught you."

that Soady had said, Lang might be suspected of the theft.

When again it came out next morning that Simpson had been sleep walking, and that Mr. Pickering, in talking to Ferguson about it, had hinted that not improbably Simpson had unconsciously stolen his own money, Melhuish felt still more relieved. Surely it was impossible now that he should be suspected!

And yet he was guilty. Yes, Melhuish was really a thief.

He had not intended being one. When he visited the Rummage-room it had not entered his head that

It was an immense relief to Melhuish, as he lay awake listening to Soady and Tommy talking, to learn that so far from his visit to the Rummage-room being suspected, Lang was known to have been there. He half hoped that, in spite of all before he left it he would have committed a crime. But temptation came in his way; he saw a box lying un-

locked, he opened it and saw a purse. He wanted money, how badly no one knew; he put his hand in and took what he could hastily grasp. Then without breathing he shut the box and crept out into the sunlight.

No one had seen him; no one knew enough about his embarrassments to make him suspected. He was safe, and, except for the fear of detection, of which he could not rid himself, he felt more relieved than he had been for weeks.

He owed money in the town. That must be squared up first. Then he would have time to arrange matters before the time when Jenkins's account was due. Jenkins's account! He didn't like to think of that.

He was considerably in debt for him, for his allowance was a very meagre one. Two pounds odd he owed from last half, and of this fifteen shillings must be paid at once, or the tradesman had threatened to see the Doctor. Melhuish had taken thirteen shillings from the box; he had three shillings left of his own. He went "down town" that same day, and settled the most pressing claim.

Still, things were far from satisfactory. Worst of all, almost, he owed Fanshawe some money. If Fanshawe turned nasty (and Melhuish knew him well enough to believe this quite possible), he could involve him in more trouble than any one by letting his father know his difficulties. Melhuish's father was strict, even severe, and would not be inclined to look with a lenient eye on his son's senseless extravagancies.

But for the present all was safe; no one could possibly suspect him, and he even went so far as to feel a sort of amusement at the wrong scent that every one was on.

After a few days the whole thing was forgotten, except by very few. Of these, Simpson and Soady had it most at heart. The latter was bent on clearing Lang.

But Soady was as little fitted for a detective as any one could well be. He could not keep a secret, and his would-be diplomatic tricks for extracting information were transparent to the most unpractised intellect.

"Tommy," he said one day, "I know who stole Simpson's money."

"Don't believe it ever was stolen," said Tommy.

"Yes it was, young 'un; don't you contradict. 'Twas Jim."

Jim was the boy who cleaned the boots of the school, no slight job. All day his rotatory machine was whirring; as soon as one set of boots was clean another set was dirty. No one had ever seen Jim out of his apron or without a boot in his hand. He was a cheeky youngster, and a good deal of rough-and-ready chaff passed between him and the boys as they crossed the lower end of the quad, near which he had his little den, the door of which was generally open.

"What makes you think Jim took it?" asked Tommy.

"I'll tell you. He can run across the quad any time when we're all in school, don't you see? The door of the Rummage-room's never locked. And Jim has been getting more cheeky lately, and we had something in Virgil the other day about arrogance increasing with wealth."

This was of course convincing to every

properly-constituted and cultured mind. Virgil must have had Jim in his mind's prophetic eye when he penned the passage.

"How are you going to find out?" asked Tommy.

"It's a job, but you wait. Next half-holiday I mean to hide in the Rummage-room; nobody will be near the quad if it's a fine day. Then Jim may come, and if so I shall jump out and nab him!"

Tommy thought it a grand idea. Next day was a half-holiday, and the two friends proceeded to carry their plan into execution. Soady pleaded headache as a reason for not cricketing, and Tommy shirked without any excuse, as he was too much in the habit of doing. Tommy kept watch to see all was clear, and when the last boy had left the school he ran out to Soady and told him he might commence operations.

Tommy stationed himself in a hidden corner to keep watch. Soady slipped into the Rummage-room, and looked around for a good place of concealment.

"Haven't been in here for I don't know how long!" he said to himself. "What a heap of things those lower school chaps have!"

It was indeed a varied collection. Boxes of all sorts and sizes, hampers by the dozen, carpet-bags, rabbit hutches—everything.

"Don't quite see where I'm going to hide," thought the amateur detective. "I should like to get into a box, but I don't see one big enough."

Soady was not of the make to pack easily; he was inclined to stoutness, and was generally big and unwieldy. After some cogitation he decided to pile up a few of the hampers in a corner and lurk behind them.

With a good deal of trouble he managed to make a hiding-place, but it had the fault that it hid him too well—he could not see what might be going on. However, he comforted himself with the thought that he could hear the slightest sound, and if any one came in he could pounce on him in a moment.

No one came; he heard the big clock chime the half-hour, and still his patience was unrewarded. He began to feel cramped, and to be doubtful whether, after all, an equally good plan would not be to mount to the music-room and watch the door of the Rummage-room from there. He must have been rather stupid not to think of that before.

He was just about to act accordingly when he heard a sound. The door had not opened, of that he was quite certain, yet there could be no doubt that something in the room moved.

Soady listened with all his ears. But the sound was not repeated.

"It must have been one of those rabbits," he thought. "I'm tired of this, I shall go out."

He stepped from behind his barricade, which fell to the ground with a crash as he pushed his way out. Arrived at the middle of the room he took a final survey. A box close to him was standing with its lid invitingly half open.

"Wonder whose this is?" he thought. "Little fool he must be to leave his box unlocked; it's a temptation to young good-for-nothings like Jim."

He kicked the lid up with his foot to see if the box were empty. The next

moment he felt himself grasped from behind, and a voice exclaimed,

"Ah, you thief! I've caught you, have I?"

Soady shook himself free in a moment. He turned round and found himself face to face with Simpson.

"Oh, you beggar!" exclaimed the small boy, in a towering rage, "what a thief you are! I'll tell the Doctor and have you expelled, you see if I don't. You give me back the thirteen shillings you stole a week ago! Give it me back, you robber!"

Soady listened in astonishment. When he first felt the hand on his shoulder he was as surprised as if a ghost had appeared. But by the time Simpson had ended his tirade his captive had recovered his presence of mind.

"Why, you little sap," began Soady, "I came in here to hide to see if I couldn't find out who stole your money. I hadn't an idea you were hiding in here too, or I'd have saved myself the trouble."

"I dare say you would," yelled Simpson. "You think I'm going to believe what you say? Not if I know it: that thirteen shillings was about all I had, and I was going to buy a new cane-handle bat, and now I can't, and I'll make you pay for it if I have you up before every judge there is."

Soady began to feel he was in an awkward hole. There was no doubt that Simpson was dreadfully in earnest, and was quite certain he had caught the real thief. If he told the Doctor, Soady would have to explain how it was he came to be hiding there, and why he opened Simpson's box. He could not help seeing that his excuses would sound rather thin. He wished he had not been quite so anxious to convict the innocent Jim.

"Look here, young un," he said, soothingly, "you mustn't make a little fool of yourself. If you think I came here to burgle your box, why didn't I start at it directly I came in?"

"Because you were afraid."

"That's bosh, you little idiot! If you won't believe what I say you can come straight in to the Doctor with me, if you like, and we'll see what he says."

Simpson hesitated. He knew the authorities already thought he had been making a good deal of fuss about his loss, which some supposed he had himself caused. He was doubtful whether a fresh complaint would receive much attention unless accompanied by actual proof. Now, though he had caught Soady in the very act, the accompanying circumstances were not quite so suspicious as they ought to be, for Soady's conduct, supposing him to be the thief, was extraordinary.

He was still hesitating what to do when the door opened and Tommy's face appeared. It wore an astonished expression when it perceived what had happened.

"Ah, Tommy, come here," cried Soady. "You tell this little mantrap and spring-gun what we arranged to do."

Tommy obeyed, and poor Simpson had no alternative but sulkily to give in, professing even to the bitter end his belief that Soady was the real culprit. For which Soady had a good mind to pulverise him, but, having a good mind, and not a bad one, he didn't.

(To be continued.)

THE ADVENTURES OF AN AIDE-DE-CAMP.

II.—THE RESCUE.

CAPTAIN PRENTIES kept the secret of the papers to himself, and joined the party at the house as if nothing had happened. The next morning one of the casks of apples was opened. A great treat was expected. Alas! the "apples" were a device of the roguish Jew to cheat the revenue. The cask was full of bottles of Canada balsam, valuable for varnishing and mounting objects for the microscope, but totally useless to those starving shipwrecked men.

On December 14 the last journey was made to the ship, which had now nearly disappeared, and the sails were cut away from the bowsprit to put over the roof of the hut. In the afternoon the carpenter died, his frost-bites having mortified and his limbs rotted off. The body was taken some distance from the camp, laid on the snow, and covered with branches, for the ground was too hard to think of proper burial. And now all the frost-bitten men began to suffer. On the 17th the second mate became delirious and died. Others followed, and such was the misery of the community that each death was welcomed as giving one month less for the scanty provisions to feed!

On Christmas Eve Prenties and the first mate went out on an exploring expedition, found a small river, and walked up it. On its frozen surface they came across tracks of moose-deer and other animals, but having no arms or weapons, to chase them would have been hopeless. Pursuing their walk, they found the trees cut on one side with axes, and then they came upon an Indian's wigwam covered with fresh bark, showing that it had been occupied within some recent period. Close to the wigwam was a moose-skin put up to dry on a pole. Prenties cut out a piece of bark like an index-hand, and fixing this to a pole so as to point towards the scene of the wreck, fixed the pole on the ice opposite the wigwam, and took away the moose-skin.

On their return some conversation took place between him and the mate as to the rate at which the provisions were going, as it seemed to be out of proportion to the rations. It was arranged that that night Prenties should keep watch over them. When all seemed to be sound in slumber Prenties saw the captain get up, go to the provisions, and with two of the men enjoy a hearty meal. The aide-de-camp lay still and feigned sleep, but afterwards either he or the mate was on guard in the hut, and the provisions were kept untouched.

And now it was decided that a party should leave in the boat and bring help to the others, and the boat was got ready. Her seams were open, and it was endeavoured to caulk them with dry oakum. This proved to be useless, and as there was no pitch or tar the sailors would have given up the enterprise. Prenties, however, thought of the Canada balsam, and this was melted out of the bottles and boiled in the pot till it attained the required consistency. It answered the purpose admirably, and the seams received a thorough coating. Sails were now got ready, and as the men's shoes had all gone a dozen pairs of canvas moccasins were made by Prenties out of the old jib—his needle being the handle of a pewter spoon, his thread the warp of the canvas.

On January 4th, 1781, the boat voyage began. There were six in the boat, the captain, the mate, two men, and Prenties and his servant. Prenties still wore the despatches round his waist and the servant still carried the gold. The provisions were divided with the party left ashore, and the wind proving favourable the boat rounded the precipitous headland and made her way along the coast. The first landing was at a deep bay where they found some poles and timbers on the beach and the remains of a

hut, while a little beyond was a high point of land, clear of wood and apparently cultivated. To this Prenties and two of the men made their way, and passed as they did so the remains of a Newfoundland fishing-boat that had been burnt. As they reached the top of the hill they saw a group of houses about half a mile in front of them. To these they hurried, but not a sign of life was there. The houses were the old stores of a cod-curing establishment, and had been deserted for years.

On their way back they found some cranberries, and these they gathered for themselves and companions. In the morning the wind had shifted, and to go to sea was impossible. The next day had consequently to be passed here, and the two next. On the night of the 7th, Prenties, looking out, saw that, though the wind was rougher than usual, the sea was smooth as glass. It was frozen over! The retreat by the sea was consequently cut off, and in the absence of snowshoes that by the land was almost impossible.

On the 10th the wind changed and the ice was blown out to sea, and the following day the boat was launched and the voyage resumed. At two o'clock in the morning the weather grew so stormy that again the shore was sought, and on a shingle beach fifty yards broad and four hundred yards long and surrounded by precipices the party landed. The beach was so high that the boat could not be drawn up, and in the night she was so beaten about that all the balsam was knocked off, the timbers sprung, and she was rendered useless. Eight days were spent on this shingle ledge, and then the sea froze and Prenties and mate started off to explore along the ice. They returned for the others, and it had been decided to abandon the boat and journey on foot when a thaw came and they were again imprisoned. Suddenly an idea occurred to Prenties to freeze the boat till she was watertight. She was dragged ashore, caulked with dry oakum, and water dashed over her until she was coated with ice. She was then carefully launched, and in this frail craft, depending for her safety on the sea being just cold enough to save her icy film from melting and not too cold to bar her passage, the six desperate men put forth. Henceforward the boat voyage was conducted under these curious conditions. The rainy days had to be spent on the beach, for the thaw rendered the caulking useless. The very frosty days had also to be spent on shore, for the ice on the waves made progress impossible.

One day the mate found a partridge asleep on a tree. A noose of canvas thread was fixed to the end of a pole and dropped over its head, and, boiled in snow flavoured with salt water, the bird proved a welcome meal for the six castaways. On the 12th of February they sighted the island of St. Paul, and from the contour of the neighbouring cliffs at last made out their whereabouts. They were ashore on Cape Breton, and the Cape St. Lawrence on its northern extremity is still named after the ill-fated brigantine. Soon they rounded North Point, and then they landed. The provisions had now all gone, and they fed on a few rose-hips they found in the snow, and on the 17th, when they beached the boat for the last time, they boiled the hips with candles to make soup. Then the candles were tried with kelp, and finally on the 23rd they were reduced to feeding on the seaweed alone. This failed to nourish them, and they resolved to eat each other. Prenties still carried his despatches and the evidence of the captain's treachery, and as the captain had stolen the provisions and behaved badly throughout, the aide-de-camp and the mate resolved that he should be the first to afford a meal. For a day or two they waited. The kelp diet had caused them to swell so that they could hardly see out of their eyes, and they were so weak as to be only able to crawl and break off the smallest twigs to keep the fire in.

On the 28th, as they were preparing to kill the captain, a couple of Micmac Indians suddenly appeared. The redskins, after a careful survey, approached and addressed the party in French. For a minute or so they regarded the swollen sufferers with wonder and then marched off and left them. In three hours, however, they came back in a canoe bringing food and help. The castaways were taken to the Indian village, and there every kindness was shown them, and they were restored to comparative health. As soon as possible they told the Indians of their companions, and asked them to go to their rescue, giving them a description of the bay in which they had been wrecked. The place was known to the tribe, but it was over a hundred miles away over the hills, and they refused to go without hope of a reward. And then Prenties's servant untied his waistband and foolishly produced all the guineas he had carried so long.

Instantly a change took place in the demeanour of the Indians. Their avarice was aroused and great obviously was the temptation to murder the party for the money. By much diplomacy the danger was averted, but it was none the less continuously present. For a handsome reward they consented to fetch the other survivors of the St. Lawrence, and some of them set out for the purpose, to return in a fortnight with the only three who were left. All the others had died from frostbite or starvation. They had finished all the beef and even eaten the skin of the deer.

A bargain was now made with the Indians to take three of the party at once to Halifax and the remaining six to Spanish River to wait for the spring. The three were Captain Prenties, his servant, and a Mr. Winslow, the other surviving passenger.

And now commenced a new series of adventures, at which we can but glance. Prenties still carried his despatches, his servant had the balance of the money, and both had to be constantly on the watch, for but little confidence was felt in the Indians, whose greed had been aroused, and who, moreover, were French converts and not likely to care for the safety of an English officer. Cape Breton, though discovered by Cabot, had had a long spell of French rule, and only became finally British on its capture by Boscawen in 1756. Broad Oar was reached, and then Broad Deck and St. Peter's Lake were crossed, half on sleds, half in the canoe. Grand Grave was the next point, and thence a canoe voyage was made across the Gut to Canso, in Nova Scotia. This was the most dangerous passage of the expedition, for at Canso were several French and American privateers, who would only have been too glad to snap up the aide-de-camp. By this time, however, he had come to the conclusion that the Indians would do their duty and fulfil their contract if they could, and so he shifted the despatches to the waist of one of the redskins, and throwing away his old red coat, assumed a brown one.

The canoe reached Canso without attracting the special notice of the ships in the harbour, and Prenties called on Mr. Rust, who was nominally the British representative, but was in reality a sympathiser with the American revolutionists and in league with the privateers. Fortunately he had received a hint to this effect, and on being questioned by that worthy gave a very plausible account of his being a shipwrecked sailor. Rust, however, suspected him, and prepared to take him prisoner and hand him over. But he was not quick enough, for Prenties got wind of what was coming, and in the night escaped with his companions in the canoe. Halifax was reached at last, and thence in the Royal Oak the aide-de-camp went on to New York and delivered his tattered despatches to Clinton. The Indians returned to their homes. The captain's treachery was reported, and he was "broke;" he ended his life as a Thames pilot! The mate became the commander of a West India trader.

ARMOUR IN HISTORY AND ROMANCE.

BY JOHN SACHS.

CHAPTER V.

Fig. 28.

THERE is a natural tendency, perhaps, to ignore or dislike a subject placed before us in "words we cannot understand." Plate-armour came to us through the Normans, and the separate parts still retain their Norman-French names. By the courteous permission of the Secretary of State, we have been allowed free access to the collection of armour in the Tower of London for the purpose of making drawings for the *Boy's Own Paper*. Among others we have engraved the splendid suit of early plate-armour at the head of this chapter. To this suit we have annexed the names of its different subdivisions.

To begin with the head, you may notice the word "bascinet." At the present time the word "helmet" is used generally for head-defence coverings, whether for a policeman, fireman, or life-guardsmen; but in former times the different head defences had various names. We have already shown that Harold and William the Norman wore an iron cap with a nasal protection. In the Bayeux tapestry both the chain-mail and plates drawn over the ears are shown. Now we read in a description of the Battle of

Hastings, by Robert Wace, whose grandfather was present in this famous field, that "the Norman archers aimed many arrows at the English, but they covered themselves with their shields, nor could they do them any harm. They took counsel to aim high; when the arrows were coming down again they fell upon their heads, and put out the eyes of several. The arrows flew more thickly than rain before the wind. Then it happened that an arrow which was falling from on high struck Harold above the right eye and destroyed its sight. And Harold by force drew the arrow out with his hands, broke it, and threw it away; and because his head was in great pain he rested on his shield." Whilst he suffered pain from the wound over the eye there came an armed man in the battle, who struck Harold on the "aventaille" (this must have been the side protection for the face before mentioned), and brought him to the ground, and when he tried to raise himself, a knight beat him down again, gashing his thigh right through the bone.

This was, according to the etiquette of chivalry, a "felon's blow," and the knight was

afterwards disgraced by the Conqueror. This incident is also carefully delineated in the Bayeux tapestry.

The defects in the helmets of that time necessitated improvements that resulted in the bascinet. The fashion of tournaments and joustings, where a dangerous kind of field-sport only was intended, required an armour giving more protection to the life of the knight, and for it a heavy tilting-helmet was used. The bascinet was used only for war; but for tournaments and joustings the bascinet was reduced to an iron cap, the inside being lined with felt or sponge, and the tilting-helmet being placed over it. The corselet, with its tapering edged front, called the "tapul," protected the chest, taces covered the thighs, vambraces and rerebraces the arms, roundels the joints of the arms at the shoulders, genouillères the knees, jamba the legs, and sollerets the feet.

The suit we have illustrated represents a specimen of those used at the close of the fifteenth century—that is, about Henry V.'s reign. The backs and breastplates are articulated. This close bascinet is, however, peculiar. It is constructed of two pieces only. Notice, too, that the sollerets have long piked toes, like the boots of the period, a fashion that shows the date of the workmanship.

In Fig. 30 we engrave a fine specimen of a tilting-helmet, that forms part of the trophy of Henry V., and hangs in the chantry of that monarch in Westminster Abbey. The border at the bottom is of brass, and has an ornamental diaper; a shield-shape pattern is in front, containing two pendent leaves.

Another tilting-helmet hangs over the tomb of Edward the Black Prince at Canterbury Cathedral; it has a crown-shaped pattern pierced in the side for hearing and ventilation.

In each of these royal trophies there are shields, the construction of which I now describe. Some years ago I had to draw the shield of Henry V. (Fig. 31), so that I can give you an accurate description. The form is of the heater shape, and it is constructed of smooth

Fig. 31.

oak. It measures twenty-four and a half inches long and nineteen inches broad. On the outside we have first, a covering of a fibrous material, over which are stretched four layers of stout linen; on the uppermost are indications of painted colours, which are probably the remains of the cognizance the shield was emblazoned with. The interior has been covered with white silk, now faded, a considerable portion of it remaining; the ground is diapered with a repre-

sensation of ivy leaves, on which is worked a semee of fleur-de-lis; over all is embroidered an escarbuncle in yellow on a crimson ground. This is one of the earliest specimens of needlework in this country, and it is a pity that it is not better preserved.

The shield of Edward the Black Prince is constructed of the stout leather of the time, called "cuir-bouilli."

But to return to the helmets. The root of the word bascinet in old French means a basin, in which form this helm was worn in the thirteenth century. In the next century a moveable visor came in, and this took a prominent and also an acute form of considerable glancing and resisting power. The visor was attached with hinges at the sides of the head-piece, and had pins, so that it could be removed at will. The acute form was used about A.D. 1350. It was worn with a camail (Fig. 25). The next improvement was a high collar of steel substituted for the camail, relieving the head from the weight of the bascinet, and allowing more freedom of movement. A still more acute visor was in fashion in 1425, and the comic artists of the period made much capital out of its eccentricity. It was called the pig-face bascinet, and examples of it are very scarce. About the middle of the fourteenth century the fashion of the bascinet got rounder at the top, longer at the back, and the result was the helmet called the salade.

(To be continued.)

TWO HOURS WITH A TROWEL.

By THEODORE WOOD,

Author of "Our Insect Allies," etc.

YOUNG entomologists are very apt to consider that all outdoor work must necessarily cease as soon as autumn begins to give place to winter. So long as they can find butterflies and moths upon the wing they are industrious enough, but, when the net is no longer of use, they seem to think that insects have totally disappeared from the face of the earth.

Now this is a very mistaken idea. Of lepidoptera, it is true, very few are to be found in the perfect state during the winter months, but pupæ are always obtainable, and eggs of good species may often be found by a little careful searching. Hibernating caterpillars, too, are plentiful enough, but these are best let alone, for they are not very likely to thrive when rudely aroused from their long slumber and exposed to the inclemencies of the wintry atmosphere. Then there are the beetles, a great number of which live through the winter in their perfect condition, and are to be found, by those who know how to look for them, in almost as great abundance as in spring or summer. Indeed it is a positive fact that there are absolutely more beetles to be found in December than in August, although, of course, they are not always so easy to get at. Yet, after all, a little perseverance is all that is required, and the collector who works systematically throughout the year will seldom have to complain of want of success during the winter months.

My readers have already accompanied me upon expeditions to ponds and haystacks in the depth of winter, in order to discover what living beings are harboured by each during their long term of repose. Let us now vary our destination, and proceed to a tree-sprinkled meadow, in order to have a couple of hours' work with a trowel.

Pill-boxes we shall want, of course, each being filled with cotton wool in order that any pupæ which we may find may travel in safety. Then we shall require a laurel-bottle (minus the laurel, which cannot be procured at this time of year), a stout knife, the all-

important trowel, and a small square of oil-cloth upon which to kneel. This last is an indispensable item, for the ground is very moist and soppy, and we do not wish to court rheumatism by kneeling upon it for any length of time.

The wind is rather cold, so we don a warm overcoat, the pockets of which are sufficiently large to contain all our apparatus without bulging very perceptibly, besides holding a sandwich or two, in case we feel the need of refreshment. We select our thickest boots, too, knowing the nature of the ground over which we shall have to pass, and take the opportunity of wearing a very old suit of clothes, which we reserve especially for expeditions of this character. Thus equipped, we make the best of our way to our hunting-ground.

Judging by appearances, we ought to meet with tolerable success, for the meadow is studded with magnificent trees, all more or less furnished with wide-spreading roots, and is bordered on two sides, moreover, by a high wooden fence, the tufts of long grass at the foot of which are tolerably sure to have afforded sanctuary to many an insect in search of a winter residence. Appearances, however, may possibly be deceptive, so we at once begin to make experiments at the foot of a mighty oak whose roots form many a nook and cranny, which must surely fulfil the requirements of the most fastidious of insects.

Nor have its attractions been offered in vain, for, as we very shortly find, quite a host of creatures are lying buried just beneath the surface of the earth. First there is a Purple Ground-Beetle, with the beautiful violet band round its wing-cases, which is comfortably curled up in a sort of cell at the roots of the grass. When we first take him out he is quite torpid, and for some seconds shows no signs of life. At length, however, he begins to kick, at first feebly, and then more actively, until his stiffened limbs seem once more capable of bearing the weight of his body, and he hurries off, with all convenient speed, to bury himself again in the earth loosened by the trowel.

Then there is a pretty little beetle, by name *Calathus melanocephalus*, whose red

thorax renders him very conspicuous as he runs along in search of a fresh hiding-place. He is attended by quite a little colony of his relations, all terribly excited at being so unceremoniously roused from their five months' nap, and rushing hurriedly to and fro in hopes of finding another and a more secure retreat in which to complete their slumbers. Of course, too, there is a nasty wriggling centipede, our pet abomination, seeming in no wise disconcerted by the bad treatment which he has received, but making off in a leisurely sort of way to hide beneath a piece of loose bark.

Amongst the roots of the grass is a pupa, evidently that of one of the smaller *noctue*, which is carefully packed away in one of the wool-filled pill-boxes, in order that the future moth may not be crippled by an awkward knock received upon the journey home. Then comes forth an earwig, with slow and uncertain step, apparently quite dazed by his unexpected experiences, and rather doubtful as to the best course to pursue. After a moment or two of consideration, however, he follows the centipede, and is quickly out of sight beneath the bark.

Another tuft of grass is pulled up, and shaken as before, with the result of sending two or three specimens of that common little nuisance, the cocktail beetle, called *Tachinus rufipes*, flying headlong on to the heap of loose earth turned up by the trowel. It is a singular fact about this beetle that it never appears to be what it really is. No matter how often it is met with, it is always deluding one into the idea that it is something perfectly different; and, what is more curious still, no two specimens seem at all to resemble one another until taken up and examined.

A small ground-beetle or two and half a dozen woodlice are scurrying along in different directions, and a large spider is lying huddled up in a corner, still quite torpid, and unconscious of all that is happening around it. There is another pupa, too, a nice-looking red-brown fellow, which we have great hopes may prove to be something good. We cannot help feeling doubtful, however; so many nice-looking red-brown pupæ have turned out to be only *Mamestra brassicae*!

(To be continued.)

CANOE, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER I.—CANOES AND CANOEING.

NOW that the long dark evenings have set in will be a good time to commence a series of practical papers on canoes and canoe-building. Summer may be the best time to use such craft, but winter offers most opportunities for constructing them.

Canoes are of varied kinds and types, differing in some cases so much that the same name seems hardly applicable to them. For example, the Canadian canoe is undecked and capable of holding several persons, while the kayak of the Esquimaux is completely covered in, with the exception of a small opening, and is as a rule only intended for one occupant.

In England little was known of the capabilities of canoes until the adventurous cruises of the celebrated Rob Roy brought into public notice a type of boat that was at once inexpensive, handy, and safe in rough water, and from that time we may date the commencement of canoe cruising and racing, which has since attained proportions which could hardly have been imagined by the originator.

Racing canoes now are as carefully built as racing yachts, and their design is as care-

fully studied, while to properly handle a racing canoe requires not only a considerable amount of practical knowledge, but a natural aptitude which comparatively few possess. Those who succeed in it are also generally authors of various ingenious inventions for saving trouble in managing their craft and for carrying a maximum of sail with a minimum of trouble in managing it, and these clever innovations are seldom worked successfully by a novice.

To my mind it is evident that the modern canoe is simply the outcome of the original construction of the savage, improved and altered by the natural principle of selection and survival of the fittest. Those craft most suited to the purpose for which they are used have been handed down from generation to generation without change by their savage owners, until civilised man, taking the general idea, altered it to suit his particular requirements and the materials at his disposal, making a construction possibly more convenient for himself and the conditions under which he intended to use it, but not necessarily improving on the original structure as intended for its particular uses.

Thus the kayak of the Esquimaux is undoubtedly the prototype of the celebrated Rob Roy class of canoes, while the water-velocipede is only the double canoe of the South Sea on a small scale and differently propelled, and the birch-bark canoe of the North American Indian is the model from which all the cedar-rib and bass-wood canoes now so fashionable are built.

Let us then look at the different types of aboriginal canoes before we proceed to consider the construction of those more suited to our materials and requirements.

THE BIRCH-BARK CANOE OF THE NORTH AMERICAN INDIANS.

This canoe in its design and construction is most beautifully adapted to the purpose

becomes the orthodox method of construction.

Now the clever naval designer of to-day does not proceed altogether in this way. He knows certain principles and laws of opposing forces, and by regular formula proceeds to draft out his plans, but still when he departs from old types that have been handed down he does not always succeed; and, in fact, for all the knowledge and scientific attainments of the day there exist things difficult to understand in shipbuilding—things apparently simple, so simple that you might almost take an axiom of Euclid to illustrate them; as for instance: "Things which are equal to the same thing are equal to one another." Well, you say, any dunce knows that! Very good; then why should it be that

ward, to go through the roughest water without shipping a drop. This is the more necessary as these canoes are quite open, and if the water tumbles aboard there is nothing in their construction to keep it from swamping them. The Esquimaux kayak, on the contrary, completely covered in, can be driven through the rough water, which may tumble over it without any danger of filling.

Built of the bark of the trees abounding in the country, sewn by the roots of other trees and shrubs plentifully to be found, and caulked at the seams with the tamarisk gum,* another common product of the country, the birch-bark canoe is easily built and repaired, while by its form it can shoot the foaming and surging rapid with safety, and when one of the frequent cataracts occur that break

An Indian Canoe Race.

for which it is used, and I doubt much if one of our best naval architects could give a design more calculated to fulfil every detail of requirement than is shown in this of the rude savage.

The only way to reconcile this apparent anomaly is to concede that the two designs would be produced on an entirely different basis, the one being the outcome of generations of canoes. Thus, the first one possibly was unsuccessful in several points; one by one these were corrected. Designs bad here and there were altered as experience and frequent upsets and disasters indicated. Probably after several owners had been through various dangers of drowning involved by their bad design, they observed that one of the tribe seemed to escape upsets in a marvellous manner; they ask questions and look into the matter, and find his canoe differs in minor particulars that produce major results, and, copying him, they go on till other accidents show further desirability. For instance, a rock is in the way and the rapids hurling the canoes on; one turns, just in time, while the other is dashed to atoms, and her crew have a narrow escape, but lose all their impedimenta. What is the reason? They examine and question, and find and imitate, and succeed in making a more handy craft, and so this process goes on. A good rough-and-ready process too, but it takes time, till at last all requirements are fulfilled; a complete type is produced by the survival of the fittest, and that type handed down from father to son

while one ship turns out a regular flyer, another built on the same lines, a "sister ship" in fact, turns out the very reverse? If you can explain and remedy this, which is only one little difficulty, you will be more clever than most shipbuilders are. But for all this, the art of naval designing has made great strides of late years, and brilliant successes have been achieved by the naval architects of the day.

One of the most curious things in the Canadian canoe is the form of the bow, which is what is termed a U bow from the form of the vertical cross section, and this bow, though used for so long by the Indians, has only lately been introduced and largely used by ship and yacht designers.

This peculiar form of bow, giving a great amount of buoyancy, enables the canoe, although almost up-ended and buried for-

the course of one "rivers in the woods" the light canoe is easily portaged past the obstruction and once more launched on the river below the fall.

If you want to know any more about the Canadian canoe I must refer you to an article in No. 245, where you will find particulars of its construction, with explanatory diagrams.

* *Tamarisk gum.* This gum is almost impossible to procure here, and I had great difficulty in repairing some canoes of this description in my possession, but when at the Fisheries I learnt the method of doing so from the old Indian trapper in the American Department. He told me to take resin and oil and boil them together until they were like toffee. The method of ascertaining the proper degree of consistency is by trying a portion with the teeth. If it adheres but slightly it is ready for use. This preparation hardens when removed from the fire, and is kept in the canoe in case of an accident, when by heating it is ready for application.

(To be continued.)

My Old Chum.

By ROBERT RICHARDSON, B.A.

HE was my first and nearest friend,
And many a long, long year
Has rolled away since last we stood
In the dear old playground here.
Tall and fair, with slim white hands,
And blue unclouded eyes,
Beautiful as a girl's in which
The soul of honour lies.

First in form and first in the field,
Gentle and bold was he;
I called him my Bayard, my beau-ideal
Of boyish chivalry.
And if ever in aught my own heart failed,
Or my effort fell faint and slack,
He cheered me again, with "Never mind, lad,
You were true to your colours, Jack."

[Loyal

Loyal friend, and generous foe,
Ready to weep or laugh;
Gay with the glad, and grave with the sad,
He never did things by half.
Scorning a lie, and scorning a coward,
On his word he ne'er went back;
"In woe or weal be true as steel,
And stand to your colours, Jack."

His grave lies lone in Indian soil,
By Hoogly's darkening wave;
Around him the sighing jungle-reeds
And sad wild aloes lave.
Leading a forlorn hope he fell,
The sword in his small white hand,
Flashing a path to fame—and death,
In the forefront of his band.

And still I see his beautiful face,
Hear the young voice silver-clear,
Of my dear old chum of that schoolboy time
Still echoing in my ear.
Like the soft refrain of a long-lost song
His words oftentimes come back,
As though 'twere only yesterday—
"Be true to your colours, Jack."

** In some copies of our issue of October 18, page 48, the name of Dr. Percival was inadvertently printed for that of Mr. Wilson.

PEACOCK.—Refer to the last number of the volumes. You will there find particulars as to covers and plates. All are in stock.

EMULP ED MON.—See our articles on Fishing-tackle in the third volume, or get Mr. J. H. Keene's "Practical Fisherman," or Mr. Francis's "Book on Angling." The "Complete Angler" is good as literature, but antiquated in its practice. For float-fishing try Martin's "Nottingham Style," price two shillings, published by Sampson Low and Co.

ROMEO.—1. By wetting it on the concave side, and holding the convex side to the fire, or giving it a bath of hot sand; but you will never succeed in straightening a board that has warped unless the curve is a simple one. 2. The only way to remove finger marks from cardboard is by rubbing them with crumbs of bread. If the surface of the board is at all rough, fine glasspaper would be of use. If you try any of the bleaching processes, the sheets of which the cardboard is composed will come apart. 3. It depends on the process, and the description is not clear in the important points. 4. Lay the map to be coloured in a slanting position, take a good soft brush full of colour, and beginning at the top, work backwards and forwards, zigzag fashion, leaving no dry line behind you, and never going over the same ground twice. You will find a ridge of colour accumulate along the lower boundary of the brush-mark, and this you take off on the return journey, when the upper line of the brush-mark you are making takes the place of the lower line of the previous one. See that the paper is free from grease-marks before you begin. Never touch paper that has been freshly painted. Wait till it is dry before you attempt to cobble.

F. W. C.—1. The Bill for the abolition of the slave trade was brought forward year after year for seventeen years before it passed. 2. The reason that the copper coinage improved so after 1797 was that in that year Boulton and Watt, of Birmingham, took it in hand. Watt was, as of course you know, James Watt, the inventor of the condensing steam-engine.

WASHINGTON AND W. S.—What a curious waste of time! We have over and over again stated in these columns that the second century commenced on the first day of 101, and the nineteenth century on the first day of 1801. The statement as to Washington's death was a well-known mnemonic, put in that form that you should not forget the date—and you never will.

FAIRBURN.—Any cricket outfitter will supply you with a pair of Indian clubs. They cost from half-a-crown to a sovereign a pair, and are of all weights from four to thirty pounds.

T. WATSON.—One of our coloured plates was the model of a barque. The sails on the mizen are the spanker and gaff-top-sail.

J. W. GORDON (Oporto).—Write to Messrs. Lillywhite, Frowd, and Co., Wisden and Co., or James Lillywhite, for a shilling cricket annual, and send the price to them of the articles you select from the price-lists bound up with the book. Include cost of carriage.

CECIL.—In all such recipes the proportions are by volume, unless specially stated to the contrary. We have given so many mixtures for graph composition. See our indexes.

ALMOND HARD BAKE.—Rather! Here they are. Split two ounces of almonds and put them into an oven or before the fire to thoroughly dry. When they are dry boil together for twenty minutes a pound of sugar and five ounces of butter, and then stir them in, and keep the mixture boiling until it crackles when dropped into cold water, and snaps between the teeth without sticking. Altogether the sugar should be on the boil for about half an hour.

L. C. P.—1. The figures are very much greater than you quote. The drainage area of the Mississippi is 1,244,000 square miles; the solid matter in solution and suspension carried down annually by the river is 6,724,000,000 cubic feet; the solid matter pushed along the bottom is 750,000,000 cubic feet; the drainage area is thus denuded at the rate of one foot in 6,000 years. The Ganges removes one foot from its drainage area in 2,358 years; the Hoang Ho one in 1,364 years; the Danube one in 6,846 years; the Rhine one in 1,528 years. 2. The average removal of the land from the surface of the globe is one foot in three thousand years, and it would thus take about two million years to denude Europe to sea level.

OUR PICKWICK.—A handy boy who is not afraid of work, and is sober, honest, and persevering, would do well in any of the Australian colonies, but it would be better for him to learn some special trade before he starts.

W. H. BISHOP.—1. When a pawn has worked its way across the board you can have any piece you like in exchange, whether the piece has been previously lost or not. Hence you can have the black bishops if you please, or even two queens. You mark the pawn with a pin stuck into it, or a collar wrapped round it.

ELASTIC.—The exercises given in our third volume are more numerous than those in any book on gymnastics yet published.

CHIEF.—The best thing to keep the shoulders from getting round is of course military drill, but we do not see how you can be far wrong if you use dumbbells and clubs, and select the extension exercises.

J. M. WILSON.—1. There is no one book in existence that gives the whole criminal law in force in her Majesty's dominions. You must get a text-book on the special branch of the subject on which you require information, and then read up the Acts and cases given in its notes. 2. The book you mention is quite obsolete, and would only mislead you. Like most old legal practice books, it is merely worth its waste-paper price.

AMBITIOUS.—A note to Messrs. Deighton, Bell, and Co., of Cambridge, would procure a list of books containing information for intending students. Get the University Calendar.

TOM THUMB.—1. The first volume costs six shillings, and is again on sale. 2. The index to the third volume costs one penny. 3. Keep your head up and your heels down.

PONTIFEX.—The church of St. Stephen's is built into the Houses of Parliament, hence the name. The crypt now used as a chapel is under St. Stephen's Hall.

B. DERBYSHIRE.—There are books on birds by Morris, Montague, Yarrell, Bree, Harting, etc. Perhaps the best plan would be to write to Wheldon, of Great Queen Street, for catalogue of his second-hand books on ornithology; or advertise your wants in the "Exchange and Mart."

GOLLOP.—It is proposed to make the Channel Tunnel entirely through the lower chalk.

R. I. U.—Quite true: it was a Bristol man who first discovered the mainland of America in modern times. At least, he was in command of a Bristol ship. His name was Sebastian Cabot, however, which sounds more like Genoese than Gloucestershire. Columbus first struck land at Guanahani in 1492. He did not reach the mainland till his third voyage in 1498. Cabot struck the mainland in 1497, Vespucci in 1499. If your argument means anything, it means that we should call America Bristolia Cabotia. But how about Ericia?

MIDSHIPMAN.—1. A book called "Going to Sea, or Under the Red Ensign," is obtainable of all the marine booksellers. It is published by Norie and Wilson, of the Minorities, costs one shilling, and gives full particulars, with pay and outfit tables for apprentices and ship boys in the merchant service. 2. It would be almost the best profession for a lad weak at the chest to adopt.

SINGLESTICK.—Get Waite's "Fencing and Singlestick" from any bookseller.

W. E. CLAY.—Sculls are generally made of pine, yellow or white preferred.

J. W.—To get the plate or plates published with any part you must buy the part, or wait till the following October, when you can buy the plates issued during the preceding twelvemonths for one shilling and eightpence the packet.

GRAVER.—You do not say what branch of engraving you wish to take up. You will find a good deal about engraving in Spon's "Workshop Receipts," and of course there are manuals on the subject. Write to Lockwood and Co., Stationers' Hall Court, or Spon, Charing Cross, for catalogues of their publications.

M. H. D.—Such diagrams are never given in detail because a brig carries the same spars and rigging as a full-rigged ship without her mainmast; and a brigantine has the foremast of a brig and the mainmast of a schooner.

BLIND BOY.—For information regarding the Braille apparatus for teaching the blind to read and write, apply to Dr. Armitage, Cambridge Crescent, Hyde Park, London.

J. M.—Read our article on "Navy Ranks" in the February part for 1884, and apply to the nearest post-office for pamphlet explaining how and where to join.

AN ADMIRER.—1. What next? "I wish to state that the coloured plate of the January number of the B. O. P. was the same as you published about a year ago; Crowns and Coronets was the plate!" You would be better for a little more sense and a little less admiration. Not only was "Crowns and Coronets" published by us in January for the first time, but it was the first sheet of the character ever issued. Nothing like it, either in subject or title, had ever been designed before. 2. When we are extremely hard up for new ideas we will avail ourselves of your suggestion. The Crests of the Peers, etc., would keep us going for some time. How many peers, etc., do you think there are?

SOUTH AFRICA.—Nearly every London publisher has a book on the Language of Flowers, selling at a shilling or eighteenpence. Apply to Messrs. Nelson, Ward and Lock, or Warne. One of the latest books on the subject is "Birthday Flowers," published by Chatto and Windus. It has highly coloured illustrations, and costs six shillings.

E. E. BAILES.—The quotation is from Juvenal. Doubtless you know more Latin than Juvenal? Did you ever hear of the critic who mistook a live owl for a stuffed one? Next time you wish to air your grammar you would find it wise to verify your quotation before you begin.

J. MACKENZIE.—1. The best thing to feed goldfishes on is ants' eggs, which you can get in threepenny or sixpenny packets at shops where they sell the fish. Whenever you buy an animal ask the dealer what he feeds it on, no matter whether it be fish, fowl, or flesh. 2. A piece of white pine, free from knots and shakes. You can get a suitable piece for a model yacht from Hudson and Carr, Endell Street and Millbank, or from any good timber merchant. If you want a piece specially chosen for the purpose you can get it from one of the builders, such as Rundle, of 50, Larkhall Lane.

BLACK RANGER.—In our third volume we had a long series of articles on "Fishing Tackle, and how to make it," and we cannot repeat. You must consult the back numbers.

No. 305.—Vol. VII.

SATURDAY, NOVEMBER 15, 1884.

Price One Penny.

SCHOOL AND THE WORLD.

CHAPTER X.

"LANG," said Soady one afternoon some few weeks later, "you're going to leave this half, ain't you—I mean aren't you?"
"Yes, and jolly glad I shall be."

"The only terms he would hear of were a sovereign each."

"So shall I, though I don't think I've had a bad time, as things go. I've never had the bother of being top of the form and having to slave like a nigger to keep there and lie awake half the night for fear I should lose my place next day. I guess, too, we shan't have such a good field for cricket in London as we have here."

"Are you going to London too?" asked Lang.

"I should think so. Why, I should die of inanition in a village. I'm going in for the Civil Service; I'm going to begin work next week."

"Have you got a nomination?"

"Don't want one now, only a certificate of character. The Doctor will give me that like a bird."

"It's about time you began to work if you are going in," said Lang, half amused at the sure way in which Soady spoke of the coming exam.

"Yes, but the exam. isn't till next year, and I'm going to have a coach in London. Coach is going to drive me instead of my driving the coach. When I do begin to work I shall work like steam; you just see."

"How about your music?" asked Lang.

"Yes; now that's a nuisance," replied Soady, reflectively. "It will be a pity if I have to give that up. I think I shall have to put in half an hour a day somehow. Music makes you so popular in London, you know. You sit down and you play a brilliant little piece—"

"Auld Lang Syne?"

"Anything you like—and there you are, don't you know! People think no end of you."

"You ought to make a big hit," said Lang.

"I don't know; I'm not cut out for parties much or that sort of thing. Where are you going to be when you leave?"

"I'm going in for law," was the rather moody reply.

"Solicitor?"

"Yes; pater won't send me to college."

"Never mind, it's better in London. But you'll have a pile of exams. to pass, won't you?"

"Yes, worse luck."

He spoke despondingly, and Soady perceived it.

"Oh, you'll get through all right if you work," he said, encouragingly. "I've known some awful fools who have passed high."

The inference was not very complimentary, but Lang did not take offence.

"You've got to be articted, haven't you?" continued Soady.

"Yes, five years I think it is, but if you pass the matriculation at the London University in the first division you save a year."

"No; really?"

"Yes, and I've had a letter from my pater this morning. Some one's told him of it, and so he writes me a tremendous epistle, piling up the agony. Says I must pass this exam. and save a valuable year of my time, that his expenses are increasing, and he can't keep me longer than is absolutely necessary, and all that sort of thing."

"You'll have to pitch into it, just like me."

"Yes, but, really, it's no use to pitch into it. Here's the best part of the half gone, and I've never even opened the books we have to translate. And I know no more of chemistry than Jim, and care less. There's no more hope of my passing the matric. this Christmas than of becoming the Prince of Wales."

"You may scrape through," said Soady, "if you do your best. You used to be fairly high up in the form till—you went down."

He scarcely liked to say "till Fanshawe took you in hand." Soady was not fond of reproaching any one else, he was aware there were too many joints in his own armour. In spite of the encouragement he gave Lang he feared his chance of passing sufficiently high to do him any good was a small one. Still, without encouragement he was even less likely to succeed.

What made Lang's chance still less was the waning of autumn, when football once more came in season. Lang was great at football and took a strong interest in coaching the second fifteen. He spent an hour at least every day in trying to improve the backward, and so far was doing a good work in the school; but when a boy is going up for an exam., and is behindhand with his work, it is no good his trying to keep up his training and practice and yet catch up his arrears of work.

"Is any one else going up for matric. this year?" asked Soady.

"Only Melhuish, I believe."

"Melhuish! He doesn't seem to be working much. He looks very ill to me, but if I speak to him he jumps down my throat, so I've given him up as a bad job."

"Yes, I can't think what's the matter with him," said Lang. "I fancy he must have some home troubles, there's nothing here to worry him much; he doesn't get into rows overmuch, and he does his work fairly well."

The subject was not a very pleasant one, so they soon dropped it. Melhuish had recently been far from a pleasant companion, either to himself or to others. He was about as miserable as he could well be.

He had written a letter home, but had received no cash in answer to his appeal. He had not dared to give the true cause of his wanting money.

The necessity for it was becoming every day more pressing. Towards the end of the summer half he and Fanshawe had been wandering about together one afternoon, when a tempting orchard seemed to invite them to plunder. They had small scruples on the score of orchard-robbing, boys too seldom have; so, having satisfied themselves that no one was watching, they clambered over the hedge and began to fill their pockets.

Then a greater temptation appeared in their path. One side of the orchard was laid out as a kitchen and fruit garden, and a large bed of luscious strawberries met their gaze. Fanshawe led the way to it, and they soon had eaten a few score.

But there was a better watch kept than they had imagined. When they

came to decamp they found a couple of men ready for them at the only available point of egress; and one of the men held in a very formidable-looking dog.

Escape was out of the question; so, thinking it would be a matter of a few shillings, they put a bold face on it and walked up to the men. But the owner of the orchard was not inclined to let them off easily, and the only terms he would hear of were a sovereign each. The alternative he offered was a visit to the Doctor and prosecution for theft.

The money was promised if time were allowed. Mr. Jenkins, the proprietor, was in no hurry, but warned them that he meant what he said.

Melhuish owed Fanshawe some money, about two pounds. Fanshawe told him he could pay Jenkins his share out of that. So Melhuish was saddled with the full amount. The date when he had promised to pay was past, and he had been obliged to write to Mr. Jenkins for an extension of the time. Even the farther limit was now near its expiration and Melhuish was no nearer obtaining the cash than before. So he had abundant reason for being wretched, seeing that Mr. Jenkins had the reputation of being a close-fisted man, who would be the last in the world to lose the chance of squeezing a shilling out of any one.

The days passed too swiftly for the miserable boy, who was firmly convinced that nothing less than expulsion awaited him if the affair became known. If he were expelled his father would—he didn't like to form an idea of what his father would do. Disown him, perhaps.

Above all he had a fear which, though seemingly unreasonable, was ever present, lest his theft of Simpson's money should be discovered.

After a week passed in dread he received a letter which brought matters to a crisis. Mr. Jenkins gave him notice that if the money were not forthcoming on the Wednesday he would come to the school the next day and see the Doctor about it. The letter reached him on the Monday. Only two days to raise the money; it was impossible!

He could not borrow it, he had already borrowed all he could; if he did he would have to pay it back, and there was no chance of that. Besides, there were very few boys who would have much to lend, for football subscriptions were heavy this year, and the half was more than half way through. Whichever way he looked the prospect was equally hopeless.

But at the worst he had one means of escape. He could run away.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Author of "Harold, the Boy-Earl," etc.

CHAPTER I.—MYSTERY AND PERIL.

Tingle-tingle, jingle-jangle, go the bells attached to the harness of a Russian carriage driving rapidly over the uneven, dusty, broad, beaten track doing duty for a road.

There are three horses; the centre horse wears the "duga," or bow to keep

his head up, and those at the side are made to keep their heads down and bending outwards, so that the ground-plan of the position of the horses would resemble a lady's fan spread open.

In the carriage are four passengers; of these two occupy the back seat, so as

to look in the direction of their progress. One is a tall, portly man, in a black cloak with a large cape. He wears the cap of an officer in the civil service; it is blue, with a green velvet band, surmounted by the badge of the service called the cockade. The other sitting next him wears a light-grey overcoat, with the shoulder-straps of a general, worn instead of the costly, cumbersome epaulettes of full dress. His cap is white, with a red band, and the cockade is fixed on the band, and not over it, showing him to be a military officer.

The two younger boys—for they are both mere lads—who are sitting with their backs to the horses, are respectively a student of the First Gymnasium of Moscow, indicated by the silver badge in front of his uniform cap, and a young Englishman in the ordinary tweed dress of an English tourist, surmounted by a soft felt hat of the same colour. The perpetual jangle of the bells on the harness, and the incessant row of the bigger bell hanging from the "duga" of the centre horse, seem greatly to fatigue Edward Tenterton, who looks wearily from the carriage in hopes of finding something to vary the monotony of the scene or to relieve the still more unbearable monotony of the bells.

"You don't seem to admire the magnificence of our Russian scenery, Mr. Tenterton," said the young Gymnasium student, a boy of some fifteen summers.

He spoke in very fair French.

"No; I don't see much to admire in these undulating plains—cornfield after cornfield, each as big as an English county, succeeded by dark pine-forests each as large as a German dukedom. It's a kind of thing that gets wearisome at last."

"You don't like the bells?"

"I find them monotonous after two days' incessant jingle-jangle, but it is highly interesting to travel this way, all the same. We in England are so apt to identify Russia with snow and ice that this awful heat is astounding. I never saw dust, to speak of, until now!"

"Terribly national you English are!" said the general. "Whatever is not English you don't like; and inconsistent people you are too, for you travel out of your native country more than any people in the world! If you like it so much, why don't you stop in it?"

Tenterton laughed merrily as he replied, "You see, by travelling we become still more attached to our tight little island; and when we find anything in art, manners, or science different from that which we enjoy at home, if superior we adopt it; if not, we are still more thankful for being English."

"National conceit with a vengeance!" said the civilian, in the Russian language, of which Tenterton knew as yet very little. "But conceit is the prevailing vice of these islanders."

"Yet they have some excuse for it," said the general. "Is that Oozonovo in the distance?"

"No; you seem to have forgotten the way. The village we are coming to is Orekhovo; Oozonovo lies more to the south."

"Ah! I remember, they form a sort of equilateral triangle, those three villages—Orekhovo, Oozonovo, and Berozovo."

"Exactly! and I mean to halt just to ask a few questions of some of my peasants in Orekhovo."

The general eyed his companion with a queer glance, which seemed to make that worthy rather uneasy. He changed the subject immediately, and said, "I am sorry you will make so short a stay with us, general; perhaps you may be able to get longer leave."

"Quite impossible. So this is Orekhovo? I remember now."

They had approached the village, which consisted of a few log-cabins formed of the trunks of pine-trees placed horizontally one over the other until the required height was reached, the fissures being stopped up with tow rammed in between, much as the planks on board ship are "caulked." The roofs were all of thatch, the windows small and as few as possible. The road was very wide between the two rows of wooden huts that made up the "village," which was perfectly innocent of pavement, being as uneven as the waves of the sea. In driving through much caution was required on the part of the driver to avoid upsetting his party by some unlucky lurch caused by deep holes and ruts all along the road.

It was a Prasdnik, or great holiday, and the peasants were dressed in their best array. The girls and women wore skirts and handkerchiefs of all the colours of the rainbow, with white aprons bordered and worked with embroidery in red and blue and yellow threads; with head-dresses formed of gracefully-twisted handkerchiefs; or, in the case of the elder girls and married women, the kokoschnik, a sort of tiara of red cloth, curiously embroidered with gold thread and glass beads.

The girls had formed a ring, holding each other by the hands, and, pacing slowly round, were singing a Russian song. The air was singularly dreary, and the words were drawled out in such a way as to produce a most melancholy effect on the listener.

The men were for the most part engaged in drinking "vodka," a spirit distilled from corn, and similar to whisky, to which the Russians are greatly addicted. Some of the younger men were playing on accordions, while others were singing songs, quite irrespective of the instrumental exertions of their friends. They were all very lightly clad, chiefly in very wide cotton trousers, like those worn by Turks, confined round the lower leg either by very high boots or by bands of linen wound round from the ankle to the knee, like the cross-gartering of the Scandinavians in the old viking times. The upper part of the body was clad in a red shirt, worn over the trousers like a blouse, and secured round the waist by a cord. The head was defended either by an ordinary cap, a high felt hat like an extinguisher, only not quite so pointed, or a small, low-crowned black hat, with a very small and very curly brim.

The song ceased as the carriage approached, and many half-savage dogs rushed out at the travellers, barking, yelping, howling, and snarling in discordant tumult. The driver, or yamschick, was fain to lay about him lustily with his whip—an instrument which, to do him justice, he rarely used to the horses.

Very soon the landau was surrounded by bowing peasants. Oh, how they bow! Hat or cap in hand, bending lowly, servilely, and yet gracefully, they thronged round, greeting the civilian as "Nicolai

Alexandrovitch"—not as Mr. Abrazoff, as we should call him.

For the Russians pride themselves on knowing the *name*—i.e., baptismal name—and the *patronymic*, which is the baptismal name of the father of the person addressed, with the addition, in the case of the nobility and gentry, of the suffix "vitch," "ovitch," or "evitch," according to certain laws governing the custom. The addition to the peasant's patronymic is "off" or "eff." But as many families had this distinction before the use of surnames became general in Russia, it is very usual to find the termination "off" or "eff" marking the surname or family name even of a Russian gentleman. Thus a boy whose father's baptismal name is Ivan (John), being himself christened Ivan, would be called Ivan Ivanovitch—John, the son of John. And if the surname were Ivanoff, he would be, if a gentleman or a noble, Ivan Ivanovitch Ivanoff; if a peasant, Ivan Ivanoff Ivanoff—though peasants rarely use the surname at all.

But we are keeping the peasants bowing and the dogs barking and the driver lashing them all this time.

"Hope you are well, Nicolai Alexandrovitch. God grant you are all well at the house!" cried a cheerful voice above the uproar of dogs and peasants. It was the voice of an elderly man, with white hair, scrupulously parted—as is the case with all Russian peasants and inferior tradespeople—down the middle. "What a long time it is since you were here! And how is Ekaterina Petrovna?"

"She is well, and will soon come to see you."

"God grant it! How is Marie Nicolaevna?" (The feminine of the patronymic ends in "aevna," "evna," or "ovna," according to circumstances.) "Hope she is well and happy?"

"Thank God!"

This is the Russian reply to a question about health. They do not *thank you* for asking, but they thank God for being well.

"And Paul Nicolaevitch?"

"There he sits; he can answer for himself."

"What! that tall gentleman? He is quite a man! Is it possible? How he has grown! Hope you are well, *barin* [sir, gentleman, master, as the case may be]; hope you are very well."

"Thank God!"

"Now," said Abrazoff, "I want you to tell me something. Where is Ivan Ivanoff?"

"Fetch him directly, Nikieter! Don't you hear?"

Away ran the young man thus addressed, and in a few moments returned, leading with him an old man dressed in the usual light costume worn by the peasants during the fearful heat of the Russian summer, of which people who have not been in India can form no idea. The new-comer bowed low and submissively before the "great ones" in the carriage, and a similar string of questions as to the health of the members of Abrazoff's family having been put and answered in due form, the old man said, "You are very good to remember me; I thought you had forgotten all about Orekhovo."

"Who? I? Never! By-the-by, I want to ask you some questions. How is little Ivan getting on?"

"How can I know? Have not seen him for years."

"What!" exclaimed Abrazoff, angrily; "not for years? What an old idiot! Drunk, hey!"

"Can't help a little vodka, Nicolai Alexandrovitch. You like it too sometimes!"

"Don't bandy words with me!" roared Abrazoff. "Take me at once to Olga Ivanovna!"

"Take you to Olga Ivanovna!"

"Yes, you old *durak*! [fool] take me to her instantly—this moment!"

"Pray excuse me, Nicolai Alexandrovitch. But you see—beg your pardon, but I can't!"

"Can't!" shrieked the barin, almost beside himself with rage. "How dare you speak of *can't* to me? Lead me to her this moment!"

"Well, the burial-ground is not far off; if you insist, I must take you. There is a neat cross over her grave, though it isn't painted."

"What! dead? Why did you not say so at once?"

"Batuschka!" ("Little Father," a very common exclamation amongst the Russians). "How angry he is! It is not my fault."

"What became of little Ivan?"

"The priest took him."

"Which?"

"Simeon Ilitch."

"Lead me to him—at once—at once! No nonsense!"

"Batuschka! He is at Ozoonovo!"

"Is it possible? Can such idiots exist?" cried Abrazoff, greatly incensed. "You shall pay for this, you shall, if I have a voice in the country! I can't flog you, as my father would have done, *but I can do worse*! Look out! Drive on, there! Why waste time on such a herd? Drive on!"

Very soon the bells were jingling as before; the good-humoured face of the driver showed no trace of annoyance at the uncomplimentary way in which his master had addressed the villagers, though he was a native of the place, and claimed acquaintance with all the inhabitants and relationship with many.

But General Zakovskie had marked all this very narrowly. He was intimately acquainted with Abrazoff—indeed, his wife had been some kind of cousin of this irascible landed proprietor. He thought it very strange that a gentleman—a man of the world, and mixing in the best circles of Russian society—should forget himself thus—before a stranger, too, for the Russian is always anxious to make a good impression, especially on foreigners.

Edward Tenterton was puzzled. He had not been long in Russia—and even if he had been it would not have helped him to the solution of the mystery, for such behaviour is not common there. The scene impressed itself strangely on his mind. So much he had understood of the conversation as to gather that a boy had disappeared whom Abrazoff greatly desired to see or to hear about; also that the old peasant-woman in whose charge he had been left was dead, and that these facts had greatly excited the gentleman with whom he was travelling.

"Nice people these!" said Edward to himself. "There is some mystery or other here. However, it's no business of mine." Then, turning to Paul, he said, "Another forest! What quantities of timber! Why, this one looks bigger than

any one we have hitherto passed through!"

"I should think it did indeed! It's *mine*!"

"Yours? Well, I suppose all the estate will be yours in time?"

"Oh, yes; when papa dies, which I hope will not be for many a long year to come. He is not bad on the whole, you know; I never saw him angry before—at least, not like *that*. But this wood was given to me on my last name's-day."

"What is a name's-day?"

"Why, you see, we true believers are baptized after the good saints who are in heaven. Every day in the calendar belongs to a saint, and, according to the guardian angel or saint, after whom a Russian is christened, he or she celebrates his or her annual holiday."

"I see; like our birthday."

"Just so. Well, on the name's-day we receive presents, and on that one when I was twelve years old my father gave me the wood."

(To be continued.)

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER V. (continued).—THE MINERS AT WORK.

IN a bowl on a bench near the window were the rough diamonds entrusted to Jacobus Vandergaart. Their value was something considerable. If he wished to cleave a specimen whose crystallisation did not seem quite perfect he would begin by ascertaining by means of his

incision in the selected face, and then he would introduce a thin steel blade into this incision, and give it a sharp blow. In this way he would cleave the diamond's faces one after the other.

If Jacobus Vandergaart wished to "cut" a diamond, or, to speak more accurately,

Jacobus Vandergaart.

magnifying-glass the direction of the cleavage planes. Then with a splinter of another diamond he would make an

to shape it into some desired form, he would begin by drawing in chalk on the gangue the facets he had selected. Then

he would place each of the faces in succession in contact with a second diamond, and then he would submit them both to

would press the faces of his stone until they had acquired a perfect polish. The crank was worked sometimes by a little

"With waggons and cattle and all their belongings."

prolonged friction. The two stones would mutually grind away each other and gradually the facets would be formed.

In this way Vandergaart would give the gem one of the customary forms, all of which can be classified under three headings, "double-cut brilliants," "single-cut brilliants," and "rose diamonds."

A double brilliant has sixty-four facets, a "table," and a "pavilion."

A simple brilliant is just half a double brilliant.

A rose is flat below and has a faceted dome above.

Now and then Vandergaart had to cut a "briolette," that is, a diamond with neither top nor bottom, and shaped like a pear. In India briolettes have a hole bored through the narrow ends, and by it are threaded in strings.

"Pendants," which he very rarely had to cut, are half briolettes with table and pavilion and faceted on the inner side.

Once the diamond is cut, it has to be polished. This is done by means of a disk of steel or lead, about nine inches in diameter, spinning horizontally on a table at the rate of from two to three thousand revolutions per minute, and worked by a crank and fly-wheel. This disk is smeared with oil, and dusted over with diamond dust derived from previous cuttings, and against it Vandergaart

Hottentot boy, who was engaged by the day, sometimes by a friend like Cyprien, who was always very happy to oblige.

As the diamond-cutter worked he talked, and sometimes he would push his spectacles on to his forehead and stop short in his work to tell some story of the past. He had been forty years in South Africa, and knew nearly all its history, and what gave the charm to his conversation was that he spoke from personal experience, and honestly believed in the traditions and prejudices of his countrymen.

Often would he tell how in early days the colony had been captured by the British, and how the Boers, to avoid the restraints of laws to which they were unaccustomed, had moved farther and farther up the country. And he would enlarge on the perils and incidents of each exodus as with waggons and cattle and all their belongings the Dutch settlers penetrated into Kaffirland in search of a new home. And many were the stories he would tell of the wars with the natives occasioned by these irruptions into the countries of the savage kings.

"At last," concluded he on one occasion, "I built this house where we are sitting, and started a farm. With me were my wife and two children. My kraal was on the site of the present mine. Ten years later John Watkins arrived in

these parts and built his first house. We did not then know that there were diamonds in this country, and so little occasion had I for thirty years to think of my old trade that I had almost forgotten the existence of such gems.

"Suddenly, in 1867, diamonds were discovered, the first recognised, as you know, while it was being thrown about by a child to whom it had been given as a pretty pebble for a plaything. In 1870 I lost my wife and children, and almost alone in the country I remained quite indifferent to the fever raging around me. I worked away on my farm just as if the deposit at Du Toit's Pan had been a thousand miles off instead of within musket shot.

"One night I found the wall of my kraal had been knocked down and the boundary removed three hundred yards farther back. John Watkins, helped by a hundred Kaffirs, had built a wall joining on to his own so as to enclose a large patch of sandy, gravelly land, up to that moment always recognised as belonging to me.

"I complained to him. He only laughed. I threatened to go to law. He told me I might as soon as I liked.

"Three days later the mystery was solved. The patch of ground was a diamond mine. John Watkins had discovered it, and, hurrying off to Kimberley, had certified it as his own.

"I went to law, and you know what that means. One by one I lost my cattle, my horses, my sheep. I sold my furniture, I parted with everything. I lost my law suit, and I was ruined.

"The decision of the court was that I had made out no claim to the land in dispute, but that to avoid further trouble they would confirm me in possession of what I then held and certify the boundary. That boundary they took as the twenty-fifth degree of east longitude. The land to the west of it was adjudged to John Watkins, that to the east to Jacobus Vandergaart.

"The mine was to the west of the line, and so, although it bears my name, it became the property of John Watkins."

(To be continued.)

JERRY'S VISIT, AND WHAT CAME OF IT.

BY THE REV. H. C. ADAMS, M.A.,

Author of "Schoolboy Honour," "For James or George?" etc.

CHAPTER III.

IN the morning, however, Sir Jerome was in no condition to sit at the window and see Jerry ride his pony. He had a terrible night, with fits of sharp pain and not a wink of sleep. Dr. Staines was much alarmed at the state in which he found his patient, and gave orders that the boy was not to be readmitted to his grandfather's room until he gave express permission. Mr. Henry Mannering wanted him to be sent away from Netherby altogether, but Dr. Staines discountenanced the step. "It would be sure," he said, "to reach Sir Jerome's ears, and might cause agitation enough to be fatal." Jerry, however, ought to be kept out of the house as much as possible. He had better be sent down to the vicarage, where Mr. Hartley's successor, the Rev. J. Curwen, a cousin of Sir Jerome's, now resided. Mr. Curwen had two sons about Jerry's age, as well as two pupils residing in his house. These would be very suitable companions for Jerry.

Mr. Mannering was obliged to be satisfied with this, and took the boy down to the parsonage, as the doctor advised; but he took care to let the Curwens know that Jerry was a regular young prig, who couldn't take part in any games, and would be frightened out of his wits if he met a herd of cows. The boys, in consequence, received him very coldly, cutting jokes at his expense, which Jerry, good-natured as he was, was not disposed to tolerate. They soon parted company. The Curwens were on the point of setting out for a walk, to try whether the ice on a neighbouring pond would be strong enough to bear. They did not propose to Jerry to accompany them, and he did not suggest it himself. Quietly wishing them good morning, he turned off another way by himself, and arrived at the Park just in time for dinner. The next two days were wet, the frost having quite broken up, and Jerry remained quietly indoors amusing himself in the billiard-room and the library, apparently quite contented. He made frequent inquiries after his grandfather, but received very discouraging answers. The old man was seriously worse, and Dr. Staines had but little hope of even a temporary recovery. He asked regularly every day after Jerry, so the boy was told, and was looking anxiously forward to the time when he might be allowed to see him again. He was told, too, that he would probably soon see his friend Mr. Fenwick again, his grandfather having sent a message requiring his presence in the course of the following week.

The fifth day of Jerry's visit was once more mild and fine, and soon after breakfast he received a message informing him that the young gentlemen from the vicarage were at the stables, and begged

he would come out to join them. He consented, and, putting on his hat, followed the servant to the stable-yard. This was situated at a considerable distance from the house, and some dense masses of shrubs intervened between the two, so that there was no fear of Sir Jerome's quiet being disturbed by any noise that might be made there. Jerry found all the four boys from the parsonage in the yard, which Henry Mannering had left only a few minutes before. He did not much fancy any of them, unless it was Lippencott, the senior of the two pupils, who seemed a quiet and good-humoured fellow enough. But of the two Curwens, one struck him as being a lout and the other a sawney, while the remaining pupil, Walter Garden, seemed disposed to play the bully at his expense.

Jerry soon learned that he was not wrong in this view. He found Garden, who plumed himself on his good riding, bent on proposing a leaping match. There was a nice stretch of turf immediately behind the stable-yard, where a leaping-bar had been set up. Garden was now suggesting that the five boys and young Gilbert Ashleigh, who had ridden over to inquire after the baronet's health, should each contribute five shillings, the whole to be given to the one who made the highest leap. The Curwens and young Ashleigh had assented willingly enough, and Lippencott made no objection to the proposed trial, but suggested that Jerry Mannering should not be included in it.

"You heard what Mr. Mannering was telling us," he said—"that his nephew was a regular molly-coddle, and couldn't ride a donkey? He might be thrown and hurt if we put him on one of Sir Jerome's ponies."

"Oh, gammon!" said Garden. "He's a precious stuck-up young muff, and wants taking down. Did you see the way he turned off last Wednesday when we went away to the pond? We owe him one for that, and we'll pay him! Here, Jerry," he continued, addressing the boy named, who had just come into the yard, "we are going to have a leaping match—five shillings a head. I suppose you will put in, won't you?"

"No, I thank you," returned Jerry, who did not at all relish Garden's tone and manner; "I haven't five shillings to spare, and shouldn't thus use it if I had."

"And, besides, are afraid of being thrown! You'd better add that, hadn't you?" returned Garden, with a sneer.

"No," answered Jerry, quietly; "I had better not, because it wouldn't be true."

"Come, don't let there be any quarrelling," interposed Lippencott; "we can have the match without him."

The ponies were brought out—two of Sir Jerome's, a chestnut and a grey, which the young Curwens were often

allowed to ride, and the one belonging to young Ashleigh. They were nearly of a size, and could leap about equally well. It was agreed that Ashleigh should ride his own pony, and that lots should be drawn for the other two. This was done, and it was found that Jem Curwen and Lippencott were to have the grey, and Tom Curwen and Garden the chestnut. They mounted and went out into the paddock, where the bar was fixed, Lawes, one of the grooms, and Hodge, the stable-boy, accompanying them to see the fun.

It proved a very close contest. The bar was three times raised before any of the party failed to clear it. Then Ashleigh, Jem Curwen, and Lippencott were all obliged to succumb, and at the fifth trial Tom Curwen followed suit. Garden was greatly pleased at his victory, and could not forbear venting some of his self-conceit upon Jerry, who had stood by critically observing the movements of the competitors.

"It's a good job for you that you didn't put your five shillings in, isn't it, Jerry? You'd have been all that worse, and had an unpleasant spill into the bargain!"

"Should I?" returned Jerry, coolly. "I am not so sure of that!"

"You're not, hey?" cried Garden. "Do you think you could have won?"

"I think the chestnut is the better leaper of the two, and that is why you won," returned Jerry. "And, as I am a lighter weight than you, I think he would carry me an inch or two higher than he would you."

"Ah! you *think* that, I dare say; but you have been wise enough to decline the trial."

"I beg your pardon," said Jerry; "I only declined to bet five shillings."

"What! do you mean you'd ride Charlie at that leap?"

"No; but if you'll put the bar one hole higher I will."

"You will! Up with the bar, Hodge, and we'll see him do it!"

"No, no, sir," interposed the groom; "Mr. Jerome mustn't try it. Charlie's very difficult to ride, as you know, except to those well used to him. Unless Mr. Jerome's a real good rider, 'twon't be safe. Sir Jerome—any ways, Miss Rosalie—would be very angry—"

"Gammon, Lawes! He's only pretending. He'll never get on Charlie's back. There," he added, dismounting, and offering the bridle to Jerry, "there's the pony, and Hodge has put the bar up. Now let us see you make good your boasting. Mr. Henry Mannering said he might ride Charlie if he chose. Indeed he said we had better ask him to do it. That's enough for you, Lawes."

"Mr. Jerome, sir, pray don't mount the pony!" said Lawes, as Jerry proceeded to shorten the stirrups. "I know harm'll come of it! Well, any way, I won't have

nothing to do with it; I'll go in and tell Miss Rosalie. Please wait till I come back, sir."

He ran off as he spoke, but Jerry, whose blood was up, paid no heed to his remonstrances. Springing lightly into the saddle, he proceeded to canter Charlie round the field, so that the pony might get used to his hand and seat before he attempted the leap. Charlie, feeling a new rider on his back, laid down his ears, kicked and plunged, and finally went off at a gallop, two or three times trying to dislodge his rider. But Jerry sat fast and allowed him to exhaust his irritation; and in ten minutes or so succeeded in restoring him to good-humour. Then, after pausing for a minute or two to allow him to recover his wind, he put him at the leap, which the pony accomplished successfully, clearing the bar by two or three inches, amid the approving shouts of all present, excepting Garden, who ground his teeth with vexation.

The sound had not died away when Lawes reappeared on the scene accompanied by Miss Mannering, who was just in time to witness Jerry's feat. She was greatly relieved by the assurance of his safety, but, nevertheless, felt seriously displeased.

"You have acted quite right, Lawes, in coming to me about this matter," she said. "Another time you will not allow the ponies to be ridden without Sir Jerome's express permission. They had better be taken in now. Jerry, wish your companions good morning. We will return to the house together." She bowed coldly round, and taking Jerry by the hand walked off with him.

A day or two passed without any further adventure; indeed the baronet's increasing illness necessitated the observance of the utmost quiet. Dr. Staines shook his head more despondingly at every visit. At last he reported that he had little hope that his patient would survive the day; and his forebodings were justified about three o'clock that evening by the decease of Sir Jerome. Two hours afterwards Miss Mannering and her brother met in the drawing-room. The former was overwhelmed with grief; but Henry had required her presence in order to assist in the necessary arrangements.

"Morton's people of course will be employed for the funeral," he said, "and I have written to Mr. Fenwick, who I believe has the will. You had better inform Clara, and at the same time request her to remove this boy, who will only be in the way here. My wife, I expect, will arrive to-morrow evening, and I wish him to leave this house as soon afterwards as possible. Indeed—"

"I will write to Clara, of course," interposed Rosalie. "But I cannot ask her to remove Jerome. On the contrary, Clara herself must be requested to come here."

"Clara! come here! Do you think I will allow that?"

"I don't think you will have any power to prevent it, Henry. I meant to have broken this to you more gently, but I must stop the proceedings you seem inclined to take. Three days ago my father burned his will—"

"Burned his will! Why Fenwick has it in London."

"No, my father sent for it ten days or so ago. He wrote, quite of his own head, to Mr. Fenwick for it. I think he in-

tended to add a codicil, as he sent a message to Mr. Fenwick soon after Jerry's arrival, desiring him to come to Netherby in a few days. But I don't think he would have burned it if it had not been for what occurred last Monday."

"Last Monday! What do you mean?"

"I mean what took place in the stable-yard. I was sitting with my father when I was told that Lawes wanted to see me immediately. I went out and returned as quickly as I could. But my father insisted on knowing what Lawes had wanted, and finding me unwilling to talk about it, sent for Lawes himself, and made him relate all that had taken place. Among other things Lawes told him that you had given your sanction to Jerry's being put upon Charlie—indeed had advised it. He was greatly excited, and sending for Hampson, in his presence and mine, and that of Lawes, threw his will into the fire. We begged him to wait and inquire further, but he would not. He then desired us to give him our promise that we would say nothing of what he had done until after his death."

Henry Mannering was on the point of bursting out into violent anger, when his attention was diverted by the sound of wheels, and a carriage drove up to the front door. A minute or two afterwards the door was thrown open and Mr. Fenwick entered the room, accompanied by Hampson and two other persons, an elderly gentleman and a lad of eleven or twelve, the latter looking very pale and sickly.

"Miss Mannering," said Mr. Fenwick, "we have come from London to explain the extraordinary mistake that has been made. I grieve to learn that we have arrived too late, so far as your father is concerned."

"There have been one or two mistakes made, I think!" exclaimed Henry Mannering. "But first I should like to ask, have you an attested copy of my father's will?"

"Your father's will! No, he has it. He sent for it last Thursday week. Why do you ask?"

"Because my sister here declares that he has burned it."

"Burned it! burned his will! Has he made any other?"

"No," said Miss Mannering. "He expressly told me he did not mean to make any other."

"Indeed! you do not say so! Then his grandson here succeeds to the entire property."

"His grandson *there*!" cried Mr. Mannering. "What do you mean?"

"I was on the point of explaining," said Mr. Fenwick. "A very strange mistake has been made. This boy here is Jerome Mannering. The boy you have had staying with you for the last ten days is Jeremiah Mainwaring, the son of a gentleman connected with the press, and now absent from England—"

"And why didn't the young scoundrel say who he was?" cried Henry, furiously. "This has been a regular plot to work on my father to destroy his will! This is your doing, Rose—yours and Mr. Fenwick's—"

"Be good enough to moderate your language, Mr. Mannering," said Fenwick.

"If it were not that I am sorry for your disappointment I should be inclined to retort on you pretty sharply. If you will listen to what Mr. Framley here, of

Netherby Lodge, Stratford, has to tell you, you will learn how it is that this extraordinary blunder has been made."

"There has certainly been a strange error," said Mr. Framley, "but I do not see that any one is to blame for it. I sent, according to my friend Mainwaring's directions, to the White Horse Cellar early on the afternoon of the 19th, but his boy had not then arrived. My servant went a second time in the evening, and then learned that a boy, whom the coachman said was Master Mannering, had been hurt by a fall from the coach-box, and was lying very ill in the inn parlour. I sent for a doctor, who told me that the boy had been severely bruised and shaken, and was, moreover, evidently very delicate. He must be kept quite quiet for several days to come. He was too unwell to be removed to Netherby Lodge. I therefore engaged a room for him at the inn, and sent a nurse to attend him. I went two or three times to inquire, but he recovered very slowly, and it was not until this morning that I was allowed to see him. Then he told me who he really was, and I discovered what a strange confusion had taken place. I called on Mr. Fenwick, who I found was to have met him, and in his company drove down here. As for Mainwaring's boy, whom I shall now take to Stratford with me, I will answer for it, from what I know of both father and son, that they are incapable of lending themselves to any trick; and I must tell this gentleman that his epithet of 'scoundrel' is altogether misapplied."

"That remains to be proved," said Henry. "I shall see whether the law will not right me, at all events."

"You can do so if you like," observed Mr. Fenwick, "but I do not think you will get much by your motion. The will which Sir Jerome destroyed was a most unrighteous one—such as a man in the last hours of his life would be very likely to destroy, if he had any right feeling in him. Moreover, there is clear evidence that he was in full possession of his senses—as competent to make or revoke a will as ever he was in his life; and the act of yours which, as I have heard from Hampson, induced him to burn it, is not one likely to prejudice a jury in your favour."

Mr. Mannering left the room, and soon afterwards the house; nor did he reappear till the day of the funeral. At Miss Mannering's invitation, Mr. Framley and Jerry remained at the Park till the following morning, when she took leave of the lad with many assurances of regard, and a warm invitation to renew his visit during the summer holidays. Her real nephew, she said, would always be glad to see him.

"He may well be that," muttered Mr. Fenwick, as he glanced from the one boy's face to the other as they took leave of one another. "I expect Jerry No. 2 is the best friend Jerry No. 1 has ever had, and if he gave him a hundred thousand pounds he'd hardly requite the service he has done him. It's just as Sir Jerome said: the real grandson is a genuine Hartley to look at, puny and sickly—just what he could not endure. Small chance of Sir Jerome's burning his will in *his* favour. Nevertheless, justice has been done, though after a very strange fashion, it must be allowed. Well, 'all's well that ends well.'"

(THE END.)

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER II.

WE will now take a glance farther north to the region of snow, where the Ice King reigns supreme, and where our friends the Eskimos build their snow houses. Now, I want you to think for a minute. I dare say if you try and build a boat, canoe, or, in fact, anything of the sort, you find it rather difficult work; you do not find it quite so easy as reading how to do it; and possibly, or perhaps I should say probably, you find it very unseaworthy when finished. And now remember you have all the appliances of civilised life to your hands. What do you think of a nail? Nothing! It is only one of the common accidents of your life. Put yourself in the position of having no nail and no means of getting one. What would you do? Put yourself if you can for a moment in the position of the Eskimo. What is his

principle of dining would not suit either of us, I think.

The Eskimo canoe is built of skin sewn together over a framework of bone, and is decked completely in by skin except the opening in which the occupant sits, which has a coaming of three or four inches high round it to keep the water out. The canoe is long for its breadth, about twenty feet, by not quite two feet wide, and is flat-bottomed, low amidships, rising at the ends. An illustration of one has appeared in the B. O. P. A double paddle is used, rather long, and it is impossible to imagine a boat more suited to the region in which it is used. Able to go with safety through a rough sea, light enough to be hauled up on an ice-floe or hauled over the ice for long distances to open water, it is indispensable to its owner, who uses it for

galley is quite different from the Clagh hooker, and both are the antipodes of the north country coble, while the Thames bawle-boat, the Yarmouth smack, the Cornish lugger, and the Scotch herring-boats are all again different, and yet these boats are all intended for one purpose—fishing, and are all made by natives of one country—Great Britain!

Many of the canoes of the South Sea Islanders are most beautifully finished, the paddles belonging to them being profusely carved, and finished with a perfection that we rarely see in civilised workmanship. I dare say, in looking at specimens of the handiwork of savage nations, you have often wondered how it was possible to produce such results with the apparently inadequate means at the disposal of the makers, but this wonder lessens when we remember that time is of no object to a savage, and he will therefore spend hours of work with a very trivial result, the carving of perhaps one paddle being a work that would exhaust the patience of any civilised man. The only exceptions that occur to me are sailors, some of whom certainly spend an enormous amount of time and trouble on little matters of ornament, such as fancy knots, etc.

The canoes constructed by savages being nearly always made from the trunk of one tree, could be made of almost indefinite length, but it was not so easy to give beam to such craft, that being regulated by the diameter of the tree, and as trees do not increase in diameter in proportion to their height, an unusually long craft would be very crank in a seaway. This the savage would naturally try to obviate, and hence the outrigger, which has the effect of making the narrowest boat stable and stiff under sail. In ordinary weather the weight of the outrigger to windward would be enough to keep the canoe steady, and when the wind freshened what could be easier than to send a few hands out to sit on the outrigger to act as shifting ballast?

A very remarkable instance of savage skill in this class of canoe is the flying canoe of the Windward Islands. These islands lie in such a position that there is always what is called a "soldier's wind" blowing between them—that is, a wind on the beam, allowing one long reach to be made with almost a certainty of fetching the desired port. Still, it is well in such a case to be as much to windward of your destination as possible, as one can always "bear up" and run down off the wind to the port, but it is not so easy if the craft by some means drops to leeward for it to work up to windward again. To meet this requirement the builders of the flying proa adopted a remarkably clever design. The leeward side of the canoe is left perfectly straight and flat, so as to oppose the greatest possible lateral resistance to the water and thus prevent leeway, while the windward side is shaped in the ordinary way. In fact, the canoe is something like a half-breadth model; from the windward side project the outriggers, with a small canoe at their ends. When the canoe reaches its destination the mast which is amidships, raking forward, is raked towards the other end of the canoe, and the huge sail swung round, so that what was the bow of the boat becomes the stern, and *vice versa*. Thus the flat side is still kept to leeward, and the canoe is ready for her homeward voyage.

The canoes of New Zealand are beautifully made and generally profusely decorated. Some of the large war canoes are of enor-

Canoe and Outrigger.

habitation? Snow. His hunting-ground? Ice. No wood but drift-wood, no iron. But you say his boat is made of skins. Yes, but how did he get the skins for the first boat, or the sinews to sew them, or the bones to make the needles? How does he manage not only to support life, but to be happy under all the difficulties of his surroundings and that amid the severities of an Arctic winter, with cold below zero. Although we are only having a chat about canoeing, we can pause for a moment to think of the blessings and benefits we enjoy through God's mercy, and also to remember that the savages we despise, and that are in many ways inferior to ourselves, are wonderful examples of the possibility of existing under circumstances that would appear at first to be insupportable. I remember when a lad thinking of the noble savage and of the free, jolly life he led. Why, there is not a boy in England that is not better off than an ordinary savage. I do not mean as regards Christianity, education, etc., but simply in a physical sense. It may be very jolly to be free on the prairie, but it is not so jolly if buffalo are scarce and nothing can be got to eat; and there is nothing especially amusing in fishing over a hole in the ice, with the thermometer below zero, knowing that your only chance of dinner is in catching something that does not want to be caught, and a few days of the "no catchee no liabee"

fishing and sealing. In pursuit of seals he pushes off, armed with a barbed harpoon with a bone head, having a line attached to it, secured at the other end to a large inflated bladder. He sees his quarry before him, and with a vigorous sweep of the paddle he is within range, and the harpoon, hurled with unerring aim, is buried in the blubbery body of the seal, which immediately dives under water, but finds itself hampered in its movements by the float, and soon has to come up to breathe, when another harpoon or a lance renders it fit for the cooking-pot.

In all such primitive constructions one cannot but remark that although they may differ widely and completely in every detail, yet each type of canoe is exactly suited to the conditions under which its builders intend to use it, and in most cases is so completely adapted for its intended work and to the means at hand for building and repairing, that civilised industry is able to do very little towards improving the principles of their construction. Thus, the kayak is exactly suited for the rough waters of the ocean, and would be useless for the purpose for which the birch-bark canoe is intended, while the latter would be equally out of place in the Arctic regions, and on the ocean would be very much "at sea." This adaptability of form of boats to their surroundings is not confined to canoes, but is found to exist in all forms of boats. The Deal lugger and

North American Indians Shooting the Rapids in Birchbark Canoes.

mous size, holding more than one hundred men. The rowers pull or paddle double-banked, and a platform is erected to accommodate the chief and his friends. These large canoes are propelled at a great rate, and the crew generally keep time by shouting and singing as they labour at the paddles and urge the great canoe through the water.

Many of the South Sea canoes are double—that is, formed of two canoes parallel with one another, a platform being thrown over them amidships, and in some cases a house erected on it. These canoes are generally steered by a long oar, and are propelled by large sails made of matting. The boats used in China are called sampans, and generally have a cabin aft. Their form is much the same as the Norwegian præm, which is still used on board Norwegian ships. It is round-bottomed, something like the section of a barrel, the stern being much wider than the bow, which curves upwards and out of the water for two or three feet, ending in a small flat half-moon-shaped piece of wood, to which the ends of the planks are fastened, the stern being also flat and semicircular. It is an easy sort of boat to build and tows remarkably well. The corragh used on the west coast of Ireland is of the same shape, but constructed of canvas over a framework of wood. On the Severn and in Ireland a curious kind of craft called a coracle is used. It is something like a half walnut-shell in shape, made of skins or tanned leather over a wooden framework. Illustrations of these were given some time ago in the BOY'S OWN PAPER.

There are many other curious forms of craft that can hardly be called canoes; for instance, the balsa of the South American coast is simply made of straw or inflated skin, and its navigator sits astride on it and paddles unharmed through the tremendous surf that breaks on those shores. Allied to this is the catamaran of Madras, which simply consists of logs fastened together, and on which the rower sits navigating the rude affair with a long paddle. As the catamaran cannot sink it is enabled to pass through a surf in which the best constructed boat would founder. But perhaps the most original craft of all is to be met with on the Nile, and in this case we have the manufacturer of a saleable article turning navigator to take his goods to market and using those goods as the means of conveyance as well as of trade. Ingenuity can hardly go further than this. I allude to the Egyptian potter, who, having a sufficiency of earthenware pots, lashes them together into a sort of raft decked with rushes, and calmly steers his strange craft to market, enjoying his "otium cum dignitate." In the same way the gigantic wood-rafts of timber-producing countries are floated down to their destination bearing a whole village of huts, and having quite a population, the numerous crew taking their wives and children with them. As they pass various parts of the river where portions of the wood are consigned those parts are detached, until at length the raft, or what is left of it, reaches the last of its numerous ports.

Although many canoes of savage tribes are intended for sailing, it is difficult to find in them any means of offering lateral resistance and preventing leeway, with the exception of the flying proa, the construction of which has been alluded to. Keels, centreboards, and leeboards, all of which are intended to give lateral resistance, seem only to appear in craft constructed by civilised man. And some contrivance is absolutely necessary to prevent leeway, for a vessel deprived of these would only be able to sail with the wind and be incapable of beating to windward against it.

This indeed was the case even with large ships down to a comparatively recent date. It is not many years ago that large sea-going vessels had to wait weeks together for a favourable wind, their build being so unsuited for beating to windward that it would have been mere waste of time for their cap-

tains to put to sea until a fair wind arose. In the present day most sailing-vessels are so constructed as to be able to make at all events some way to windward against an adverse breeze, though, of course a square-rigged merchant-vessel, though a clipper amongst her own class, would do very little against a smart yacht or other fore-and-aft-rigged vessel, which on a dead beat to windward would soon leave her out of sight to leeward, as any fore-and-aft-rigged vessel can sail several points nearer to the wind than a square-rigged craft, and would thus gain on every tack, even if only going through the water at the same speed.

(To be continued.)

TWO HOURS WITH A TROWEL.

BY THEODORE WOOD,

Author of "Our Insect Allies," etc.

PART II.

OUR next tuft we find to consist of nothing but small lumps of hard, dry clay, so unpromising in appearance that we are more than half inclined to pass it by without examination. On shaking it, however, we are astonished to find that quite a little family of Pill-beetles had taken refuge within it, and are now lying motionless, with their legs and antennæ packed neatly away beneath their bodies, in the hope of escaping observation. One or two of these go into the collecting bottle to replace damaged specimens; the remainder are left to their own devices.

Clinging closely to the bark of the tree which has been left bare by the removal of the turf are several of the pretty little yellow-spotted *Dromius* beetles, which in the warmer seasons of the year are so plentiful beneath the bark itself. Crouching in a cranny, too, is a beautiful specimen of one of the larger ground-beetles, *Cychrus rostratus*, looking like a huge weevil, were it not for its long and straight antennæ. Two or three more pupæ, too, find their way into our pill-boxes, and when we transfer our attentions to a neighbouring elm we have already made a very fair number of captures.

Our first discovery here is a very curious one—viz., a kind of stag-beetle cemetery, quite a large collection of jaws, wing-cases, and legs being packed away in one of the angles formed by the roots. How they got there is a mystery, for the insects would hardly have arranged to die in company in a certain spot, and we can scarcely suppose that any marauding animal which had been preying upon them would so neatly have disposed of the portions which were too tough for his powers of digestion. And then, do animals eat stag-beetles? We have once seen a dog do so, but he howled grievously for a long time afterwards, and evidently would not have cared to repeat the experiment; and the hero of the present banquet, if banquet it has been, must have got through at least twenty of the beetles. So we are again puzzled, and are forced to give up our speculations in despair.

Insects are not quite so numerous here, but we bottle a specimen or two of the very pretty little *Pæderus littoralis*, with its blue wing-cases and scarlet thorax and abdomen. There is quite a cluster of woodlice, too, in one corner of the tree, and beneath a piece of projecting bark is an old spider's web, with the remains of various luckless creatures which have furnished the owner with a meal.

Just as we are leaving the tree we turn up rather a curiosity in the shape of a limp and sluggish newt, which must have travelled for a long distance before finding a retreat to his liking, for there is no pond within two or three hundred yards. We are rather puzzled to know what to do with him, but finally cover him carefully up beneath a sod, in the

hope that he will manage to survive until the spring warmth rouses him once more into active life.

So quickly has time passed by that we shall only be able to devote a few minutes to the fence, and we therefore set to work at once, dragging back the grass and weeds from its base, but not stopping to shake the tufts as before. Scarcely have we worked over a yard of ground when we find cause to regret that our time is so limited, for insects, spiders, and centipedes in endless variety are clinging to the fence, or burrowing rapidly into the earth in order to escape from the unwelcome cold of the outer air. Beetles are especially numerous, and in some cases it is almost as much as we can do to examine them all and see that nothing of value is allowed to escape. For a quarter of an hour or so we are busily employed, and when at last we are obliged to desist from our labours, we do so with the firm intention of revisiting the meadow at an early opportunity, and working the entire length of the fence in earnest, a task which will oblige us to spend at least two more hours with the trowel.

OUR NOTE BOOK.

THE RAILWAY DOG.

During a recent visit to Wolverhampton, "Help," the fine collie dog that collects funds for the orphans of railway men, and who has his headquarters at the chief offices of the Amalgamated Society of Railway Servants, City Road, realised by his mute appeals the sum of £25 8s. 5d. The dog had collected over £200 for the orphans during the present year up to September.

"HE'S A BRICK!"

Plutarch, in his life of Agesilaus, King of Sparta, gives us what is claimed to be the origin of this quaint and familiar expression, though we have heard other explanations, one at least of which has been referred to in our columns. On a certain occasion an ambassador from Epirus, on a diplomatic mission, was shown by Agesilaus over his capital. The ambassador knew that the monarch, though only nominally King of Sparta, was yet practically ruler of Greece, and he therefore expected to see massive walls rearing aloft their embattled towers for the defence of the chief towns; but he found nothing of the kind. He marvelled much at this, and spoke of it to the king. "Sire," he said, "I have visited most of thy principal towns, and find no walls reared for their defence. Why is this?" "Indeed, Sir Ambassador," replied Agesilaus, "thou canst not have looked carefully. Come with me to-morrow morning, and I will show thee the walls of Sparta." On the following day the king led his guest out upon the plains, where his army were drawn up in full battle array, and, pointing proudly to the serried host, he said, "There, sir, thou beholdest the wall of Sparta—10,000 men, and every man a brick!"

BOYS' "PENNY DREADFULS."

Several correspondents have forwarded us within the last few weeks loose advertisement sheets of literary trash and garbage addressed to boys, which they had found between the leaves of their BOY'S OWN PAPER. We thank them for thus communicating with us, but if they would really assist us to stop such pernicious practices we would ask them kindly to carry the matter a little further. Of course, as we have more than once explained, and as we should think must be obvious without any such explanation, all such advertisements are inserted by unscrupulous persons after the numbers or parts containing them have been purchased at our office in the ordinary way of business, and

Engr. & Binger, Chromolith. 15 Holborn Viaduct
[56 PATERNOSTER ROW E. C. LONDON.

ARMS OF THE COUNTIES OF ENGLAND

THE BOY'S OWN PAPER.]

removed beyond our control. It is quite impossible, therefore, for us alone to stop the disreputable practice; it is but one of the many penalties we have to pay for our success; yet our readers may help us very materially. The mischief is clearly done either at the booksellers' who supply the complainants or at the wholesale agents' from whom these booksellers themselves obtain their supply. Hence, what we would ask is this: that wherever boys or their parents find such surreptitious insertions they should at once complain to the bookseller from whom they purchase. It will then be for the bookseller, if he is himself only a sufferer, to bring the complaint promptly before his wholesale agents; or if he does not like personally to do this, then to furnish us with their names in confidence, and we will

soon bring such pressure to bear as is likely to prevent any repetition of the nuisance. Some time ago we were, thus aided, able to trace the offender, a foreman packer in a most respectable firm, who had been seduced by gifts of money privately to insert the obnoxious bills in all the BOY'S OWN PAPERS passing through his hands. We need scarcely say that there has been no further cause for complaint from the booksellers supplied by that firm! May we not solicit the help of all our friends in this matter?

REWARDS FOR HEROISM.

The committee of the Royal Humane Society has just completed the investigation of an unusually large number of cases of saving life, principally in the United King-

dom, and has conferred rewards on seventy-nine persons who, in many cases under circumstances of great gallantry, rescued eighty-two others from drowning. A significant feature of the cases is that a considerable number resulted from accidents while bathing, and it is noticeable that many of the rescued were "unable to swim." Of the seventy-nine cases, medals have been conferred upon fifteen persons, one also receiving the clasp; forty-six received testimonials; and seventeen pecuniary rewards. The recipient of the clasp (who had previously received the medal) is Mr. F. J. Davis, second officer of the P. and O. Company's steamer Poonah, who on the 15th of July plunged into thirty feet of water in the Royal Albert Docks and rescued a lad named Pring. The plunge involved a long illness.

THE COUNTIES OF ENGLAND.

(See the Coloured Plate issued with Monthly Part.)

THERE is a popular superstition that "England was first divided into counties by Alfred the Great." It would be difficult to find a statement further from the fact, as instead of the country being "divided into counties," it was the aggregation of the counties that formed the country, and this took place long prior to the days of good King Alfred. The counties are the representatives of the old independent kingdoms, the union of which gave us our modern England; those kingdoms, in short, which by another error are occasionally assumed to have been always seven in number and forming a heptarchy.

Kent, Sussex, Essex, Suffolk, Norfolk, Middlesex, and Surrey are all ancient kingdoms, and Lincolnshire, or Lindesse, was at one time an independent State. In later times, however, when the country was complete and the divisions assumed the dimensions which they now retain, Strathclyde, Northumbria, East Anglia, Essex, Mercia, Wessex, and West Wales were the groups from which the shires immediately came. Durham and Northumberland were parts of the old Northumbria, and Westmoreland and Cumberland were formed out of Northumbria and Strathclyde. The fifteen shires of the Danish law were scattered over Northumbria, East Anglia, Mercia, and Essex. Northumbria yielded Yorkshire—subdivided into three ridings or trithings; East Anglia gave Norfolk and Suffolk; Essex gave Essex; Mercia gave Leicestershire, Derbyshire, Rutlandshire, Huntingdonshire, Buckinghamshire, Bedfordshire, Nottinghamshire, and Lincolnshire—the latter divided into three parts, Lindsey, Kesteven, and Holland, with the first of them, like the county of York, divided into three ridings; Cambridge-shire came from Mercia and East Anglia; Lancashire from Mercia and Northumbria; and Hertfordshire and Middlesex were parts of Mercia and Essex. The eight shires of the Mercian law lay entirely in Mercia, and were Cheshire, Staffordshire, Shropshire, Worcestershire, Oxfordshire, Herefordshire, Gloucestershire, and Warwickshire, the latter divided into sipescons. The nine shires of the West Saxon law lay all in Wessex, and were Somersetshire, Berkshire, Wiltshire, Dorsetshire, Devonshire, Hampshire, Sussex, Surrey—divided into rapes—and Kent or Cantescyre—divided into lathes or lests, yet again subdivided into vills. Cornwall was formed out of the West Saxon and Cornish kingdoms, and was itself divided into subsidiary shires. In all the Anglian counties the subdivisions are known as wapentakes, while in the rest they go by the name of hundreds, the hundred being the Old English hundred, one hundred and twenty—for such is the real

meaning of the word—as still living in the long hundred and long ton of our country markets. Each hundred was supposed to contain a hundred and twenty families, and was subdivided into tithings or tenths, each of twelve families, the twelve families giving us the twelve good men and true who form the British jury.

Cornwall, as we have said, was divided into shires instead of hundreds, and there were many shires, some still existent and many non-existent, beyond the forty. Even the City of York was divided into ten shires, and modern Yorkshire includes the much older Borgheshire, Craveshire, Richmondshire, Kirbyshire, Riponshire, and Hallamshire, while Bedlingtonshire, Norhamshire, Allertonshire, and Islandshire in Durham, Hexhamshire in Northumberland, and Winchelcombeshire, absorbed by Gloucestershire, still crop up in official papers.

The distinguishing characteristics of the English race from the very earliest times, even in their old continental home, was their power of self-government. That which formed the parish, the manor, or the township in later times, was the village community, and in it the political and judicial organisation was complete. The townships formed the hundreds, the hundreds formed the county, but all were organised on the same lines. The township had its tuncemot and tuncerefa, just as the shire had its folk-mot and the kingdom its witan. This was the earliest grouping—the old tun, whence came the name, was the homestead surrounded by a quickset hedge, inferior in defensive power to the more wealthy man's house begirt by mound and ditch, which in its name of burh gave us our present burgh and borough—but as years rolled on the ecclesiastical division or parish being in so many cases continuous with the township, the secular name died out, the parish became the unit, and the vestry meeting succeeded the tuncemot.

Before the coming of William the Norman each county had two officers, the earl and the sheriff, the earl being the representative of the county before it lost its independence, the sheriff being the representative of the king. The earl's authority was thus a constantly diminishing one, while the sheriff's surely increased. As representing the king, the sheriff began to hold his courts for the administration of justice, hence the "county courts," and the appeal from these to headquarters gave us the higher Courts of King's Bench, Common Pleas, and Exchequer, now amalgamated into the High Court. The sheriff was also the financial representative of the Crown and levied the rates, and when representative government became officially recognised it was the sheriff who elected

knights of the shire. In the time of Henry VIII., however, the sheriff was deprived of much of his dignity and a new officer appointed, the Lord-Lieutenant, who now holds the command of the militia and yeomanry, keeps the records of the quarter sessions, is the head conservator of the peace, the direct representative of the sovereign, and occupies very much the position of the old earl, who represented his county's independence in the past.

The history of the counties is well shown in the arms, which, to the confusion of all the heralds, they persist in bearing. A county, say the heralds, is not a country, is not a corporation, is not a person, and cannot bear arms. But it does, and they continue to be publicly displayed on its official documents, buildings, and uniforms, and the heralds are in despair. Many of the shires have adopted the arms of the town from whence they take their name, and the town being an heraldic entity the heralds are therein satisfied. Others, on the contrary, have the old devices under which their people's forefathers marched to battle. Kent has the white horse of the Jutes, Essex the daggers of the East Saxons; others bear the arms of the old earls—Cheshire has the wheatsheaves of Earl Randle, Buckinghamshire the swan of the De Bohuns; others bear punning devices—Oxford has the ox treading the waters, Cambridge has the bridge and the boats. Of course Berkshire has the five heads and Nottingham the three crowns, and of course Hertford has its stag in the park, Derby its stag in the ring fence, and Huntingdon its stag being shot at under a tree in remembrance of famous Robin Hood, whom it claims as its earl. Cornwall has its eight castles, though its fifteen balls "one and all" would perhaps be more appropriate; Devon has the castle of Exeter, Surrey has the castle of Guildford; Rutland, Somerset, and Wilts have their well-known badges, while Bedford, Dorset, Durham, Gloucester, Leicester, Salop, Worcester, and York bear the arms of their county town.

The names of the forty are not easily remembered by every one. For the benefit of those in search of an "artificial guide to recollection" we give the three following astonishing hexameters from one of the memory books:—

Nor cum-dur; we la-york; che-de-not-line;
shrop-sta-ie-rut norf;

Her-wo-wa-northa; bed-hunt-camb-suff;
mon-gl-oxfo-buck-hart-ess;

Som-wilt-berk-middlesex; corn-dev-dors-
surrey-kent-suss.

From Nature.—Autumn in the Woods.

ARMOUR IN HISTORY AND ROMANCE.

BY JOHN SACHS

CHAPTER VI.

Fig. 40.

DURING the reign of Henry VI. the fashion of the salade as a helmet was adopted in this country. The word comes from "Celata," Italian, also German "Schale" or "shell." It was constructed of various patterns. The specimen we engrave (Fig. 32) is from one in the Tower of London. It is an iron cap that could be shut over the chief part of the face, a slit being pierced through the front for the sight. The back was long and curved, so that it could be thrown backwards and worn like a lady's bonnet when not wanted for actual warfare. Sometimes it was constructed without the eye-slit, and a visor and mentonnière or chin-piece was added. It was made very heavy for jousting, and of a thinner metal for archers. The lighter salades had also moveable plates behind constructed like the scales of a lobster's shell, so that the head could be moved backwards and forwards with facility. From Shakespeare's description it was used by the London troops.

In the second part of "King Henry VI." Jack Cade is supposed to soliloquise and pun to himself. "Wherefore, on a brick wall I have climbed into this garden—to see if I can eat grass, or pick a sallet (salade) another while, which is not amiss to cool a man's stomach this hot weather. And, I think, this word 'sallet' was born to do me good: for, many a time, but for a 'sallet' my brain-pan had been cleft with a brown bill; and, many a time, when I have been dry, and bravely marching, it hath served me instead of a quart pot to drink in; and now the word 'sallet' must serve me to feed on."

We have used the word "visor," which we now explain. It was a moveable plate of steel that could be fitted to the helmet at will. When not wanted it was left at home, but

in full uniform it was always worn. Its use was as a protective plate that could be shifted upwards for the purpose of refreshment. The poet Shakespeare uses the word "beaver" for the visor, from which we get our word beaverage. In Hertfordshire the farmers still

having worn his "beaver up" (Act i. Scene 2); also in "Henry IV., Part I." (Act iv. Scene 1),

"I saw young Harry,—with his 'beaver' on,
His cuisses on his thighs, gallantly arm'd,—
Rise from the ground like feather'd Mercury."

This word "beaver" has been confounded with the word "bavière." The terms mentonnière and bavière were both applied to a chin-piece that could be lowered for speaking and for fresh air. This protection was often adjusted to the salade and other helmets. Fig. 33 represents a

Fig. 33.

bavière or mentonnière as used in the latter part of the fifteenth century; also it can be seen "fitted" in Fig. 26 and Fig. 27. The lighter salades were often covered with velvet and the ornaments gilt. They were also pierced with holes for fixing plumes, wreaths, and mantling. Figured salades covered with velvet can be seen in the Tower of London.

The next helmet invented was the Armet. This term is a diminutive of the word "heaumet." According to the description given by the Baron de Cosson, "Before the invention of the armet all helmets fitted on the top of the head, or were put right over it; but in the armet the lower part of the helmet opened out with hinges, so that when put on it enclosed the head, fitting closely round the lower part. It was thus neater, lighter, and more moveable, while its weight was borne by the gorget." It was used in France in 1472, but it does not appear on English

Fig. 38.

term their second breakfast beaver. The monuments before the reign of Henry VIII. Ghost of Hamlet's father is described as | The armet appears in profusion in art work

from about the year 1500. We engrave a unique specimen of an armet that is now in the British Museum, but was formerly in the collection of Sir R. Meyrick. It is so constructed that it could be altered to the defence or sport required.

Fig. 34 is a profile view, Fig. 35 is the

Fig. 35.

bavière taken off, Fig. 36 is a front view of the armet thus reduced, making a simpler and lighter helm, which Sir R. Meyrick terms the little armet. This beautiful specimen was not, however, of the orthodox shape, and we proceed to another example. Fig. 37 is an armet in the collection of the

Baron de Cosson. Another, but without the visor, is in the Rotunda at Woolwich.

A realistic idea of the appearance of knights and their armour in battle can be well seen in the picture by Paolo Uccello, which work was painted A.D. 1416, and is now in the National Gallery. It represents the Battle of St. Egidio, and from it we engrave the group of figures on the right of the painting (Fig. 38). The knight on the right has, we suppose by luck, in his semi-blinded state successfully avoided both the thrust of a lance and a sword, and is riding onward to strike the knight on the left with his *martel de fer* (a pointed hammer that was introduced in the reign of Henry III.). The opposing knight has raised his sword to guard against the blow.

The armour depicted is interesting. The back plate is composed of two pieces; the roundels and genouillères are very large, passe guards are added to the neck, the sollerets are still pointed, but the spurs have rowels. The knights of both factions have in their armets curious plumes and crests; the ground is strewn with fragments of lances, shields, etc. At the latter part of the reign of Richard III. armour assumed a fantastic and almost a grotesque form, particularly in the enormous fan-like elbow-pieces.

(To be continued.)

R. W. B. (Leicester.)—In No. 79 you have not given the best moves for Black. The very first rule in the "Chess Guide" (page 15) says that each player must endeavour to checkmate the adverse King.

H. M. (Bath.)—It is already known that No. 77 can be solved by 1, Kt—B 7 (ch.).

H. M. (Forest Hill.)—Your end-game will appear. The old rule of one Queen is the right one.

F. M.—Ihre No. 80 ist sehr gelobt worden.

OUR OPEN COLUMN.

[Original Etchings by R. Watson Councill, Bristol.]

WRECK OF THE DUNBAR.

Mr. G. D. HARRISON writes from Brisbane, Queensland, under date of August 20th: "I have read, with painful interest, the account of the wreck of the Dunbar at Sydney, which appeared in your issue of May last. It is very correct, with this exception—the 'Gap,' where she was wrecked, is on the south side of the entrance to Port Jackson, not on the north side, as the account states. I remember the occurrence well, as I was a resident in Sydney at that time. On the day following the disaster I went out to the scene of the wreck, and shall always vividly remember the painful sight of the mutilated bodies being dashed about by the breakers amongst the rocks at the foot of the cliff. To show how sudden and unexpected the occurrence was to the poor creatures on board, the body of one female was washed on shore with a piece

CHESS.

To Chess Correspondents.

W. H. R. (Dudley.)—In No. 80 there is no mate after 1, Kt—B 5, K×R.

of unfinished crochet or needlework in her hand that she had evidently been engaged with.

"The gloom thrown over the city by the occurrence was intense, as so many well-known and respected old residents perished. The occasion of the interment of the bodies, and portions of bodies, recovered was one that I shall never forget, with all its tragic surroundings. The funeral procession took place in the evening, by torchlight, accompanied by a large number of people, every sign of mourning being exhibited, by the shops being closed, blinds down, colours half-mast high, etc. The bodies were interred in two large yawning graves in the Newtown Cemetery—now, the coffin of an adult, followed perhaps by that of a child—all taken promiscuously out of the hearse, in some cases without name on as being unidentifiable, the clergyman reading the funeral service over the whole; Johnson, the solitary survivor, standing by the side of the graves, and the surrounding people, with scarcely a dry eye amongst them. There was something very solemn and impressive in the sight, which would never be forgotten by those present.

"I do not think, unless it were the cases of the foundering of the steamer London in the Bay of Biscay, and the loss of the Royal Charter on the Welsh coast, there has ever been, with all its surroundings, a more heartrending case of shipwreck than that of the Dunbar."

Correspondence.

*** Don't forget to order our Special CHRISTMAS PART, price 6d., to be had of all booksellers.*

TAMP COLLECTOR.—Stamps are specially printed, so that the marks of them, if not indelible, cannot be removed without discolouring the stamp. This is done to prevent fraud, and there is consequently no known way of taking inkstains out of stamps without injuring them.

JUMBO.—Heigho! Indian clubs, O Jumbo! are elongated dumb-bells. They are not insurance societies! You will find nothing in our articles about an Indian's "expectation of life," but you may discover a health-giving exercise for your policy-holders, and so we give the information you ask for. The articles on Indian Clubs were in the August and September parts for 1882.

B. C. G.—1. You need not attend personally to take out a patent. You can send the documents through the post. You generally apply for provisional protection, the advantage of which is that you gain experience in working, and do not bar your right to some foreign patents by publication. 2. You can file your final specification at once if you like, and take up your patent for four years.

AN EGG COLLECTOR.—1. Our plate of birds' eggs was issued with the part that began the articles. It was the part for May, 1880; the articles ran through the June and July parts. 2. With regard to self-education by "instructors," "educators," or "cyclopedias," we should say begin with the one that may be publishing at the time, take it in week by week, and completely master one number before you buy another.

O. U. P.—A hide when it is "green" will weigh about eighty-five pounds, but when it is dried or salted it will weigh only about thirty-three pounds.

OUR BUOYS.—They all mean something, of course. The way into harbour is between the lines of buoys; those on the starboard side as you go in are painted red, those on the port side black. A buoy with red-and-black horizontal stripes is always in the centre of a narrow channel, and the ship should be steered as close to it as possible. Red-and-black vertical stripes point out the ends of spits and reefs with channels on both sides of them. Red-and-black chequered point out a solitary rock or obstruction, with deep water all round. If you find a red-and-white chequered buoy near a black-and-white chequered buoy, the buoys point out two obstructions, and the red is on the starboard side of the channel between. A green buoy shows that a wreck has obstructed the channel; and when two green buoys are used, that with an even number is on the starboard side of the way in, that with an odd number on the port side.

A. L. A.—There is a "Magic Lantern Manual" published by Warne and Co. It costs a shilling.

H. BELL.—The West India Docks were opened in 1802, the London Docks in 1805.

J. B. P.—It is but a bootless quest. Trade names for patented articles do not always owe their derivation to dictionaries, but spring from the imaginative mind of the inventor, regardless of language or grammar. Sometimes they betray a sense of humour. Melbourne, for instance, gloried in a tailor who advertised his six sorts of trousers under the aboriginal-looking titles of "The Shoortophitplese," "The Nobianate," "The Kwithikik," "The Hasulikum," "The Cenzashun," and "The Kwithchise."

C. DOBSON.—1. Your best plan would be to go to the Natural History Museum at South Kensington, where you will see a series of cases on the first-floor each devoted to the bird, with its nest, eggs, young, etc. The fact of the nest being placed in position on the usual tree, with the proper surroundings, will teach you more in ten minutes than all the books in the world. 2. There are many other birds extinct in recent times besides the moa. New Zealand had a gigantic goose that has disappeared. You will find one of the skeletons at South Kensington. The dodo is also there.

ATLAS.—Such an atlas would cost a couple of guineas. Apply for list of atlases to Stanford, of Charing Cross; or Letts, Son, and Co., King William Street, London Bridge.

R. V. COULCHER.—Break the glue up into small pieces and put them into the pot until it is half full. Then pour in cold water until the pot is full to the brim, and leave the glue to soak for twelve hours or more. At the end of that time you will find the pieces of glue have absorbed nearly all the water, and swollen up so as to nearly fill the pot. Do not add any more water to the glue, but place the pot inside another pot, and heat it up in a water bath, such as a proper glue-pot.

ROUGEMONT.—The Duke of Wellington was born in 1769, and died in 1852.

PERCY SHEPHERD.—1. Shakspeare's "As You Like It" is dated 1600. 2. Ten pounds. 3. There is no difficulty; "the lowest score in a cricket match in a single innings made by a club" was 0.

LASCELLES.—All the monthly parts are in print for 1882 and 1883. You can get them through any bookseller, or direct from us.

BEGINNER.—Shilling books, teaching you how to play the concertina, are obtainable from all music shops and instrument sellers.

A. J. Y.—Go by all means, and when you get there never write to an editor and "expect a satisfactory reply." The Canadiana Offices are at 9, Victoria Chambers, S.W.

WOULD-BE SCULPTOR.—You can get modelling clay from Brucciani, Russell Street, Covent Garden; or Doulton's Pottery, at Lambeth.

R. J. SYMONS.—We are unable to remember a book "that gives an insight into the cutting-out of trousers," but would suggest that an old pair taken to pieces would answer every purpose. In the event of one pair only being available, a modification of the Highland costume might be adopted for the nonce.

UNCLE ARTHUR.—Is it not rather "Wastlers"—the "Wandering Minstrels"—from "waste," to wander? We do not know why the 17th of January is selected in Somersetshire for singing to the apple-trees.

IVANHOE.—A coloured plate of birds' eggs was in the part for May, 1880; a coloured plate of stamps is simply impossible, as a moment's thought would show you.

NIGGER.—There are no people that are really black. The deepest tint is a dark brown, and this is but a deeper shade of skin-colour which is found in all grades up to the pale buff of the Englishman. The freckles and spots which appear on some people are simply portions of the skin that have shaded down.

RADICAL.—The suggestion has been frequently made before, and declined. If you want to start a parliament among your friends or schoolfellows, do so, and it may succeed; but, carried on through a newspaper, it will certainly fail, unless perhaps the newspaper devotes itself entirely to it, and contains no other matter.

L. P. and AN ANXIOUS ENQUIRER.—For lightning-paper dry a thousand grains of pure nitre at moderate heat, place it in a dry retort, pour on it ten drachms by measure of strong sulphuric acid, and distil it until six drachms of nitric acid have been passed into the receiver. Then mix in a glass five drachms of the nitric acid with an equal volume of strong sulphuric, and after the mixture is cold immerse in it some thin, dry, unsized paper, pressing it down with a glass rod, covering the vessel with a glass plate, and leaving it alone for a quarter of an hour. Lift the paper out with the glass rod, throw it into a bucket of water, and wash it until it fails to reddens blue litmus. Dry very gently, and take the very greatest care all through, as the slightest slip or mistake may necessitate a doctor's bill, if not a coroner's inquest. Hence all such matters are best not dabbled in by amateurs.

F. RICHARDS.—The coloured model of the barque was given away with the September part for 1882.

ROBIN.—Inquiries made at the consular offices in London would put you on the right track. For list of consuls and their addresses see Whitaker's Almanack or the London Directory.

B. T. E.—1. The era of the Parsees is reckoned from the accession of Yezdajira, on June 16th, 632 A.D. They have twelve months of thirty days each, and give subsidiary days at the end of the year. 2. The Hindoos call this the fourth age of the earth, and reckon from February 18th, 3102 B.C. 3. Gautama (Sakya Muni), the founder of Buddhism, died 543 B.C. He was contemporary with Nebuchadnezzar.

TIPPOO SAIB.—1. Mendelssohn died in 1847; his last piece was the "Night Song" (No. 6 of Op. 71). 2. Captain Marryat's books in order of date are—"Frank Mildmay" 1829; "King's Own," 1830; "Newton Forster," 1832; "Peter Simple," 1833; "Jacob Faithful" and "Pacha of Many Tales" in 1835; "Japhet in Search of a Father," "Pirate and Three Cutters," and "Midshipman Easy," all in 1836; "Snarleyow," 1837; "Phantom Ship," 1839; "Poor Jack" and "Olla Podrida" in 1840; "Masterman Ready" and "Joseph Rushbrook" in 1841; "Percival Keene" in 1842; "Monsieur Violet" in 1843; "Privateersman" and "Settlers in Canada" in 1844; "Scenes in Africa (The Mission)," 1845; "Little Savage" and "Children of the New Forest" in 1847; and "Valerie" in 1849. He also devised "The Signal Code of Flags," and published it in 1837; and wrote an "American Diary," issued in 1839. His life, by Florence Marryat, was published in 1872.

T. E. R.—1. The spirit is alcohol, with a little colouring. Mercury is best for high temperatures; spirit for low ones, as it is more difficult to freeze. 2. Fahrenheit made a freezing mixture to give the intensest cold he knew of, and that gave him his zero. Since his time our knowledge of the range of temperature has been greatly increased. 3. Both by pressure and temperature.

BELLS.—Dumb-bells should never exceed two pounds in weight. Exercises with the heavy bells, as they are called, are useless, and their place has been taken by the Indian club practice.

A. ASPAN.—Apply to the Cyclists' Touring Club, 139 and 140, Fleet Street. Information as to bicycle roads and routes is easiest obtained through their various representatives.

RIPLE.—Get a Whitaker's Almanac, and see the name of the governor of the prison in which you wish to obtain an appointment. We do not think, however, you have the slightest chance of success.

A LOVER OF THE SEA.—If you were to love the sea a little less, and its literature a little more, how much better it would be! Lord Nelson was shot on board the Victory, and if you go to Portsmouth you can see the ship and the place where he fell. You are the only "lover of the sea" we ever heard of that was unacquainted with this fact. What a privilege originality is, to be sure!

A. TAPSON.—Buy our fifth volume and read "The Thrones of the Ice King."

A MERCHANT TAYLOR'S BOY.—You can dye the flags with Judson's dyes, or with ordinary colours mixed with varnish, such as you use for magic-lantern slides.

DIOPENES.—1. Your science, like your name, is remarkably weak in the knees. "Astronomers," as you call them, are not so foolish as you imagine. The earth is in space, and the planets are in space, and the earth is "in the heavens" of the planets just as the planets are "in the heavens" of the earth. 2. If you wish to learn how to clubbush a ship, buy Captain Burney's "Young Seaman's Manual," price 7s. 6d., from Messrs. Trübner and Co.

A. V. MCCLELLAND.—1. We never heard of the publication you name, and we never recommend or depreciate a competing periodical. 2. A dollar is roughly worth four shillings and twopence, but its exact value varies with the rate of exchange.

G. COMER.—You can get the "Giant Raft" in our third volume, or in the series of Jules Verne's works, published by Sampson Low and Co. at seven shillings and sixpence each.

C. F. H.—You can get clay for modelling from any of the Italian image shops; or from Brucciani, of Russell Street, Covent Garden; or Doulton's, of Lambeth.

NATURALIST.—You can get materials for bird-stuffing at Burton's, 191, Wardour Street, Oxford Street.

F. WILLIAMS.—1. Paraffin oil gives the greatest heat, but a spirit-lamp is generally used for small boilers. 2. You will find how to build plank models in the boat-building articles in our August, September, and October parts for 1882.

A FAT ONE will find half a dozen articles on training in the second volume. They began in No. 74, and were in July and August parts for 1880.

BLOCKHEAD.—1. Robert Burns was born in 1759, and died in 1796. 2. Metropolis is originally the city from which the measurements were made, then the seat of the Metropolitan or Archbishop, and now used as a general name for the capital of a country, district, or cluster of towns engaged in any particular trade.

CARNARVON.—1. Choir is pronounced quire. 2. All the paper is in print, but the number can only be obtained in the volume or part form.

G. M.—The best way to preserve birds' eggs is to blow them; in fact, no means of preserving them whole has yet been discovered. In our second volume we had a series of articles on eggs by the Rev. J. G. Wood.

II. J. RICHARDSON.—1. Take the number of innings, from it deduct the number of "not outs," and divide the total runs gained by the remainder. 2. Take the pads to pieces, wash them with soap and water and a little whiting, and make them up again. In other words, leave them alone.

GASPAR DISALO.—Maple back and Swiss pine front and sides is the usual arrangement. Wood for violins can be bought at Hill's, 72, Wardour Street, Leicester Square.

BIDDLE (Marlborough).—1. Leave the hazel stick in a dry, cool place until it is nearly dry. Then trim it and thoroughly sandpaper it, and give it a dressing of boiled linseed oil. When that has quite dried in give the stick a coat of French polish, and finish it with one or two coats of copal or hard spirit varnish. 2. No.

ST. MUNGO, JUNIOR.—See your back numbers for dumbbell exercises in "Athletic Training" and "Indian Clubs," and "Gymnastics;" for paint to stand fire in "Pottery Painting;" for softening bird-skins in "Boy's Own Museum." You can fix pencil drawings by giving them a coating of collodion, obtainable from any photographic-material shop.

ROUNDHEAD.—1. It is twelve o'clock at the first stroke of the large bell. The chimes are run through before the hour; the bell strokes, except the first, take place after it. 2. Clean with ammonia or vinegar.

BUB.—The use of "while" in the sense you quote is an archaism. Whether it is grammatical or not depends on the date of the grammar. Discontinue its use yourself, but do not despise, or correct, other people for using it.

W. B.—The recitation, "Curfew will not ring to-night," is by an American authoress. You will find it in Schaff and Gilman's "Library of Religious Poetry," published by Messrs. Sampson Low and Co.

NATURALIST.—Refer to the June part for 1882, with which we published a plate of all the British Birds, and identify yours for yourself.

L. A. KING.—"Cleanliness is next to godliness" is an old proverb, by some ascribed to Matthew Henry, the Commentator.

ABORIGINAL.—1. The game of knuckle-bones is prehistoric. 2. Write to the publisher. 3. We believe that Chambers's Encyclopædia can still be obtained in parts. Messrs. Cassell are now publishing a "Concise Cyclopædia" that may be useful to you.

W. R. B.—Coat your drawings with collodion.

AN ARTICLED PUPIL.—1. A very good black is made by mixing vegetable-black with gold-size until the mixture is of creamy consistency. Black Japan is generally used. To properly ebonise wood boil a pound of logwood chips for an hour in half a gallon of water, and brush the hot liquor over the work to be stained; and when it is dry give it another warm coat. Then mix an ounce of green copperas in a quart of hot water, and brush it over the work as soon as the copperas is all dissolved. Let each coat dry thoroughly before you put on the next, but do not dry by the fire. Size before you begin to polish. 2. Fir poles are used for ladders, the spokes being generally of elm.

H. H. B.—1. Guides to the Wye Valley are published by Messrs. A. and C. Black, Ward and Lock, etc., and are obtainable from most railway bookstalls. 2. Damp the wood on both sides, and dry gradually. 3. Buy your varnish ready-made. Mahogany varnish is made of four parts of gum sandarach, two of shellac, one of gum-benjamin, and two of Venice turpentine dissolved in spirits of wine, and coloured with dragon's blood.

A. CLARKE.—1. An able seaman in the Navy is paid one shilling and sevenpence per day. 2. Warrant officers are chosen from the ranks. 3. Apply to a post-office for Government pamphlet.

W. H. M.—1. For books on shorthand apply to Mr. Pitman, Paternoster Row. 2. The book-keeping books recommended for the Chartered Accountants' examinations are Hamilton and Ball's, published by Clarendon Press; Gordon's, published by Wyman and Sons; and Crellin's, published by George Bell and Sons.

EARNST ENQUIRER.—1. For appointments in the diplomatic service you must obtain a nomination before you are allowed to compete. Information you will get in any of the Civil Service Guides. Apply for guide to Stanford, of Charing Cross; or Warne, of Chandos House, Bedford Street, Strand. 2. You can get a two-shilling manual of precis-writing from same publishers. 3. It depends entirely on the peculiarities of the examiners.

SQUEAKER.—Water-colours are mixed with glue or gum when made into cakes, and a little glycerine is added when they are required in moist form. Hence when dry add glycerine.

S. B. M.—The first London Bridge was of wood. It was built in 1014. The second was of stone, built in 1209. New London Bridge, the present one, was begun in 1824.

YOUNG SEPTONIAN.—You can get any book from a first-class bookseller by ordering it. A reference to the London or English catalogues will tell him the editions and prices.

J. C. BODEN.—1. The stamps were Austrian and Danish. 2. The question was answered in No. 221. The weight of the earth in tons is estimated at £,426 and eighteen noughts after it.

A. SHORE.—The articles on "Fishing Tackle and how to make it" ran nearly all through the third volume.

J. W. CLARK.—We gave Kingsley's song of "Three Fishers went Sailing" in the March part for 1882. It can still be obtained at the published price.

ONE OF YOUR 1,000,000 CONSTANT READERS.—The "Daily News," "Daily Chronicle," "Pall Mall Gazette," and "Echo" are Liberal party papers; the "Standard," "Morning Post," "Morning Advertiser," "St. James's Gazette," "Globe," and "Evening News" are Conservative party papers. The "Standard" is now perhaps the most liberal of the Conservative papers, the "Pall Mall Gazette" was the most conservative of the Liberals, but has lately grown more radical. The "Daily Telegraph" claims to be Liberal, but the leaders of the party do not seem to acknowledge it. The "Times" claims to be above party; it supports whatever may be the existing Government, and endeavours to represent—the nation.

MACFARLANE.—Maclean's work on the Highland Clans was published by Mr. Mitchell, of Bond Street, at eighteen guineas. McIan's work was published by Messrs. Ackerman, of Regent Street, at twenty pounds. Logan's "Scottish Gael" was published by MacKenzie, of Inverness. They are now out of print, so that you would probably have to give considerably more for them.

KOWARX.—For particulars of how to enter the Royal Naval Reserve apply at the Mercantile Marine Office near St. Katharine's Docks.

E. A. S. F.—The Institute of Civil Engineers is at 25, Great George Street, Westminster.

JUZKEZI MUEZZY.—You should get the third volume. There was a series entitled "Balloons and how to make them," which began on page 70.

C. T. C.—We never under any circumstances answer correspondents through the post, and the fact of your sending us a stamped envelope gives you no right or preference over hundreds of others who do not send us stamps. Your answer was crowded out. It was simply to the effect that we never impart information on medical or surgical subjects. Consult a doctor.

T. W. PATTON.—All in good time. The subject of coins is so large that you must make up your mind which country or period you wish to study, and then we can probably give you the name of a handbook. One on English coins is now publishing in parts at 170, Strand.

F. H. ELSLEY.—A good manual on punctuation is published by Wyman and Sons, price two shillings. Its title is "Spelling and Punctuation."

AMICUS.—There is no liquid which will extract ink from sized paper without leaving a stain. As a good eraser you could not do better than use fine sandpaper. It is not advisable to scratch out entries in books of account. If a mistake has been made, out with it by a transfer entry or a red line. You may hide the error your way, you will never hide the fact that an error has been there.

R. B.—You might get a good telescope secondhand; but, as a rule, the so-called second-hand optical instruments have been failures at first-hand.

E. M. J.—To clean a felt hat from grease, take out the lining, and wash the hat in a hot solution of soda, or of sesqui-carbonate of ammonia.

A. W. DARTON.—The Aquarium articles were in the July and August parts for 1880. They began on page 611 of the second volume.

LOVETT.—1. Unlike he is of age; but the position of a lad who dawdles about at home when his father wishes him to go to work would, we should imagine, be so unpleasant that the lad would very soon tire of it. 2. Passports are certificates given by the representatives of the country that you are known to be a British subject and are travelling for the purposes specified. 3. Run errands; and the more he knows of figures and English the better.

E. S. ROBERTS.—A quarterly Navy List will give you the latest information. The lad must be under thirteen, and be nominated by a flag officer.

No. 306.—Vol. VII.

SATURDAY, NOVEMBER 22, 1884.

Price One Penny.
[ALL RIGHTS RESERVED.]

"A startling cry of 'Fire!'"

A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS.

Author of "Harold, the Boy-Earl," etc.

CHAPTER I. (*continued.*)

IT was late in the afternoon when the carriage arrived at Berozovo, and Terterton was surprised to see no fences, no walls, nor any demarcations to show where the estate of Mr. Abrazoff began and where it ended. They drove at last between two upright stone pillars—or rather obelisks—much in decay, and overgrown with weeds and moss.

"There is the gate," said Paul Abrazoff.

"Where?" asked Edward, in surprise.

"Oh! there is nothing like what you would call a gate, you know; only those two obelisks mark the entrance to what may be called the 'Home Park.'"

Applying such a term to the wilderness around, from which the two obelisks made no severance of the portion which they were supposed to guard, seemed very ludicrous; but still Edward refrained from laughing, and was, in fact, all curiosity to know what was going to happen next in this queer place.

At last the carriage reached an odd sort of irregular building immediately in front—as Edward at first thought, though he afterwards found that it was at the back—of the great house itself, where he proposed to pass the rest of the

summer holidays teaching Paul English and reading our glorious classics with madame.

It was a long, low structure of wood, was the house itself, and the building before—or rather, behind it—was the stables. At each end of the house was a separate porch or entry, one being for the male inhabitants and friends of the master, and the other for the lady of the house, her friends and servants. Between the two doors were five tolerably high windows; above them and above the doors there was a number of small square ones, evidently giving light to very low rooms above. The other “front” of the house contained twelve large windows, the three centre ones opening on to a terrace, and being themselves arranged in a semicircle, formed something between a large bay-window and a summer-house.

As we have before observed, it was a “prasdnik,” or holiday. All the servants and their families, therefore, who inhabited the outhouses—which formed one side of the immense courtyard, of which the great house formed another—came thronging round the carriage.

“Welcome, Nicolai Alexandrovitch!” resounded in every possible key, from the child of four years of age to the old man of fourscore winters. The gay colours of the picturesque dresses of the peasant-women, and the holiday air of the whole scene, greatly impressed Tenterton, who thought to himself, “Abrazoff can’t be such a bad fellow after all.”

At the top of the steps leading to the men’s entrance stood Madame Abrazoff, to welcome her husband and his friends.

This was done in a very affecting and charming way. She first made the sign of the cross over his brow, then kissed him on the forehead and on each cheek, saying as she did so, “Slava Bogu” (Glory be to God). “I am so glad to see you safe!”

“Welcome to Berozovo, general. I trust you will make a long stay. Your old room is ready, and ‘Vasca’ is at your service to carry you whithersoever you like.”

“I hope he will not carry me far from Ekaterina Petrovna! I shall not like that, I assure you,” said the general, bending down with mediæval gallantry and raising the hand of the lady of the house to his lips, like a knight of the Middle Ages.

Indeed, the whole scene looked mediæval. The quaint court, the decaying walls of the stable, the number of retainers, their bright dresses—the unfamiliar appearance of everything, struck Edward Tenterton as though he had gone to sleep and had been rudely awakened three or four centuries or more ago.

After the welcome to her son—which was as solemn and touching as her reception of her husband, only perhaps a little warmer and not so formal—Madame Abrazoff turned to Edward, saying, “And this, I suppose, is Mr. Tenterton?”

“Beg pardon,” said Abrazoff; “I ought to have presented him before. My wife speaks a little English, Mr. Tenterton, and will be glad to improve her knowledge under your guidance.”

“Welcome to Berozovo,” said madame, in English, and without the trace of any foreign accent. “We shall do our best

to make you feel at home, though we cannot pretend to offer you English comfort.”

The party now entered a very large room, the side of which occupied the whole of the side of the house. Along the wall were seven large windows, and at the front end, and at the back end, were four windows respectively. It had two doors, one leading to the drawing-room, library, and boudoir of madame; and the other to the entrance-hall, where she received the party.

“Now take Mr. Tenterton upstairs to his rooms, and then come both of you down to dinner as soon as possible.”

Paul led the way up a rickety little flight of stairs to the floor which was lighted by the small windows we have noticed at the back of the house. They found a long corridor, with many doors in it, one of which Paul opened, exclaiming, “This is mine; yours is the next room to it.”

He then opened another door, disclosing a large, bare, melancholy room, with an old-fashioned German bedstead—something between a child’s crib and a horse-trough. There were two windows, between which stood a very old, rickety writing-table. On the side of the room opposite to the bed was an ancient and very dirty sofa. Three chairs of a past generation completed the furniture. There was no carpet, no blind, no curtain. A door near the sofa revealed a small room—or rather closet—in which was a dirty table of plain deal wood, without any attempt at paint or decoration. On this stood a large brass basin for washing, and to a hook hung a clean towel. There was a huge press, or wardrobe, in this little room which occupied the greater part of the area.

A servant now appeared, who, assisted by a moujik, brought up Tenterton’s portmanteau, which they placed before the writing-table and withdrew.

Tenterton flung off his jacket, and was proceeding to disrobe himself still further, when Paul looked in at the door to ask whether he had any soap. Visitors in Russia generally come supplied with this article. On hearing of this defect in the Englishman’s outfit Paul disappeared, but soon returned, bidding Tenterton to “Look sharp, for the dinner-bell would sound presently,” and presented him with a cake of “Old Brown Windsor.”

Edward opened his portmanteau, which was of superior English make. The lower part contained his clothes—dress-coat, frock-coat, etc., etc.—while the top was filled with linen and lighter matters, among which were several packets of papers and documents, and many loose papers besides. These he carefully placed on the writing-table while he took out clean linen, for the dinner. He had just placed the last of these papers on the table when the dinner-bell rang!

“What shall I do now? I shall never be ready in time! How provoking!”

Here Paul knocked at the door.

“Come in, pray.”

“Are you not ready yet?”

“No; I haven’t even got my dress-coat out, and the bell has just rung!”

“That’s the first bell. Look sharp! We never dine in evening dress in Russia, especially in the country. Put on anything clean. You have washed your face and hands; that will do, only make haste!”

Tenterton obeyed. He put on the

“clean things,” then threw on a frock-coat, and had just buttoned it when the second bell sounded.

“What a bore! I can’t leave these papers out, and there’s no time to put them away.”

Here he observed that the old writing-table possessed a drawer. Quick as thought, he tugged at the handles, and pulled so hard that it came open, although it had evidently been locked before. Into this drawer he now swept all his valuable papers, never noticing that there were some in the drawer already.

“Now then, Mr. Tenterton!” cried Paul. “Look alive! The soup will be cold, and then I shall catch it for not being down in time.”

The papers being thrust into the drawer, and the frock-coat being buttoned in all haste, the two youths hastily descended the stairs, and found the assembled family taking zakouska.

Of course, an English reader wants to know what that is. In few words, it is a “whet” or sharpener to the appetite, and consists of various kinds of appetisers—as sardines, anchovies, pickled herrings (oh! how seductive they are in Russia!), cheese, and caviare. But this is not all. There are besides all sorts of liqueurs, from the common Russian vodka up to the finest and most delicate French intoxicants. These are all spread out on a side-table, and are partaken of standing before dinner.

Strange that the guardian saint of the family should be made to watch over the poison of the nation! Yet so it is. Generally this table is placed in a corner, and over it, cutting off the corner, is the picture of the household deity—the saint upon whose day the father of the family was born—the saint who is supposed to intercede for him, and to obtain pardon for his sins of that Being whom the humble Russian thinks himself unworthy to approach!

Well, Tenterton and Paul reached the dining-hall just as the guests were sitting down, and Tenterton was amused to find that the ladies sat at one end of the table and the gentlemen at the other.

There was quite a party—as there always is in the houses of wealthy Russian proprietors. There were Madame Abrazoff, and three governesses for her daughter—a German *fräulein*, a French *mademoiselle*, and a Russian *gospojay*. There was a lady of the neighbourhood visiting; then there was Marie, the daughter of the family—a very sweet girl of some sixteen summers.

Tenterton sat next General Zakoffsky, and he could not help remarking that his Excellency—every general is “your Excellency” in Russia—was very much pre-occupied, and answered at random to questions put to him. Thus, when a servant, handing him the soup, asked him which kind of pirog (little pies like sausage-rolls, only not a tenth part of the size) he would like with his setchee (cabbage soup), he replied, “Olga Ivanovna!” Whereat the man smiled, and said, “We have only egg and cabbage, but no Olga!” At which his Excellency frowned, and the frightened servant let fall sundry pies on the floor, which he picked up and quietly replaced.

The host was very pale and greatly agitated; irritated at trifles, absent in mind, dreamy, sometimes over-polite, sometimes downright rude.

"Nervous man, evidently," thought Tenterton. "I pity his wife!"

Glass after glass of costly wine did he swallow, and as the dinner progressed, and riabchicks (a sort of very plump partridge) were served, he drank freely, but still seemed unable to banish the annoyance which evidently oppressed him.

"Nice family!" thought Tenterton. "Head of it evidently a drunkard, or else he has something on his mind which he tries to drown. Well, it is not *my* business. The boy seems a decent fellow, mother very kind, and daughter charming. After all, things might be worse, and I hope I may be of use to the boy, that's all."

After dinner Paul and his mother invited Tenterton to take a stroll in the "ornamental part of the grounds," as they termed it. They took him quite round the house, and showed him how it was built of wood, like the huts of the peasants, only that the horizontal logs were defended from the action of the weather without by boards and planks nailed over them, while inside the same kind of boards were nailed over the logs to present a smooth, even wall-surface to the interior, which could be handsomely decorated and papered.

While they were examining the house in this critical manner, Abrazoff and the general approached.

"Are you teaching Mr. Tenterton how to build a Russian house, Katinka?" (A pet name for Ekaterina—Catherine.)

"I don't know myself, Kollie [short for Nicolai] how to do it; but I dare say the English understand building as well as we do."

"They don't use iron roofs," said Abrazoff; "we always do. See how pretty that roof of mine looks, painted as it is of so bright and fresh a green! There is nothing like it in England!"

"Wouldn't that house of yours burn down rapidly?" said Tenterton.

Abrazoff started. "Who told you it would burn?" he asked, with rude abruptness.

"Nobody told me; I can see it myself. The wood is old and dry, a spark would set the whole ablaze; and you Russians are always smoking, which, in such a house as this, I should think almost suicidal. Fancy such a house burning, and the great red-hot iron roof falling on the crushing embers! Horrible!"

Abrazoff had been about to interrupt this speech, but as the young Englishman continued he turned ghastly pale, and abruptly walked away.

The general gave Tenterton a look which the young man did not comprehend, although it was evidently meant to convey something. He then left him to the ladies and Paul.

Coffee—delicious *café noir*, without which a man has not dined in Russia—was served in the bay window of the drawing-room. Then there was a long chat about the state of the peasants, and about the good-fortune which Simeon Ilitch, the priest of Ozoonovo, had recently enjoyed, having now a regular income, though nobody knew from what source; only whispers went that a little orphan boy whom he had taken care of had "brought him luck."

At this, too, Abrazoff seemed excited.

"Queer fish to let every little thing affect him," thought Tenterton; and he added, under his breath, "Is he cracked?"

"Oh, no!" exclaimed Madame Abrazoff, who had caught the remark; "the priests are often like that."

Tenterton did not ask, "Like what?" but as soon as tea was over retired to his room, and, without unpacking his trunk any further, undressed and went to bed.

He could not tell how long he had been asleep, when he was awoken by a terrible noise of crackling of timber, a fearful smell of burning wood, and a startling cry of "Posjarr! Posjarr!" ("Fire! Fire!")

Hurriedly he started from his bed. It was daylight, and as he threw on his clothes the hissing, roaring, cracking, and smell of burning wood increased every moment. He hastened to his portmanteau, which was still lying open, and, congratulating himself on not having unpacked it, thrust hastily such articles of linen and other matters as he had taken out all into the lower part, or bottom of the box.

Suddenly he remembered his papers! They were very important to him; so, hesitating but for a moment, he dashed at the drawer.

It was difficult to open it, as it fitted very tightly, and thus some valuable time was lost before he got it out. Then he turned the drawer upside down over the portmanteau to secure the safety of every scrap of paper, flung the drawer away, locked his portmanteau, strapped it securely, and dragged it to the door, when the intendant, or steward of the household, burst in with the words, "Posjarr! Posjarr! Save yourself!"

"Help me down with this *tchemodan*," said Tenterton.

The man only understood the word "*tchemodan*" (trunk), but that was enough. He good-naturedly caught hold of the portmanteau with one hand while Tenterton seized it with the other. In a few moments they were safe in the court, with the trunk between them.

The lurid glare from the burning house strove with the red beams of the summer dawn as to which should tinge the sky of the deeper hue. The cry was taken up by all the host of servants. "Posjarr!" resounded far and wide. It reached the village of Ozoonovo, where again it was re-echoed by the peasantry, and the harsh, guttural tones of the word seemed to acquire fresh and more horrid meaning in repetition, as voice answered to voice, "Posjarr! Posjarr!"

(To be continued.)

THE STAR OF THE SOUTH:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER VI.—IN CAMP.

THE subject of the conversation was not very agreeable to the young engineer. He scarcely liked to hear such imputations on the honour of the man whom he persisted in regarding as his future father-in-law. And so he came to consider Vandergaart's statements as merely the pleadings in his lawsuit, and therefore liable to considerable alteration when compared with those of the other side.

Watkins, to whom he one day spoke on the subject, burst into a shout of laughter, and as his only reply tapped his head with his finger, thereby intimating that Vandergaart was simply mad.

Was it not possible that the old man, under the excitement of the discovery of

the mine, had imagined that it was his property on insufficient evidence? The Court had evidently decided against him all through, and it would be very strange had they no cause for doing so. And so Cyprien continued his visits to Watkins Farm, although he knew what Vandergaart thought of its owner.

There was another man in the camp with whom Cyprien was on visiting terms. This was Mathys Pretorius, a name well known to all Griqualand miners.

Although only forty years old, Pretorius had for many years roamed about the great valley of the Orange before settling here. But this nomadic existence had not, as in Vandergaart's case,

had the effect of souring him. On the contrary, he had grown good-humoured, and so fat that he could scarcely walk. He was just like an elephant.

At home he was nearly always seated in a huge wooden chair, built specially to support his majestic form. Abroad he never went except in a carriage made of wickerwork, and drawn by a gigantic ostrich. The ease with which the bird drew the huge mass after him was a striking demonstration of his muscular power.

Mathys Pretorius always came to the camp to arrange about the sale of his vegetables. He was very popular, although his popularity, being due to his extreme cowardice, was scarcely an en-

viable one. The miners amused themselves by endeavouring to frighten him with all sorts of fantastic rumours.

One day they would tell him of an

above the camp, and consisted of alluvial land that might be diamantiferous, though nothing as yet had shown that it was so.

"On their way to the wash."

inroad of the Basutos or the Zulus; another they would pretend to read in a newspaper that an Act had been passed making it punishable for a man to weigh more than three hundred pounds; another they would declare that a mad dog had been reported on the Driesfontein road; and poor Pretorius, who was obliged to take that road home, would find a thousand excuses for remaining in camp.

But these imaginary alarms were nothing to his actual terror lest a diamond mine should be discovered on his estate. A horrible picture of the future presented itself to him—avaricious men invading his kitchen garden, upsetting his vegetable borders, and ending by turning him out and taking possession! For how could he help thinking that the fate of Jacobus Vandergaart would be his?

One of his most relentless persecutors was Annibale Pantalacci. This mischievous Italian—who seemed to prosper exceedingly, judging from his employing three Kaffirs on his claim, and sporting an enormous diamond on his shirt-front—had discovered the Boer's weakness, and at least once a week made it his business to go digging and pecking near Pretorius Farm. The farm lay along the left bank of the Vaal, about two miles

Pantalacci, entering thoroughly into the spirit of his cumbrous joke, would place himself full in view of the windows of the farm, often bringing with him a few companions to assist in the comedy. The portly farmer would be seen dodging behind his cotton curtains, anxiously following all their gestures, ready to rush to the stable, hitch on his ostrich, and be off at the first sign of their success.

Why had he been foolish enough to tell one of his friends that he kept his ostrich harnessed night and day, and his carriage packed with provisions, ready to start at the first unmistakable symptom of invasion?

"I shall go up amongst the Bushmen, to the north of the Limpopo," he said. "Ten years ago I traded ivory with them, and I would a hundred times rather do that than remain amongst such a lot of lions and jackals as we have here!"

And the confidant—as is the custom of confidants—immediately hastened to make the confidences public, and Pantalacci seized on the opportunity, to the great amusement of the miners.

Another constant victim of the same facetious individual was the Chinaman Li. Li had settled at Vandergaart Kopje, and opened a laundry. The mysterious red box contained nothing but

brushes, soda, soap, and washing-blue. Such was all that an intelligent Chinaman required to make his fortune with in this country.

Cyprien could hardly help laughing when he met the ever-silent and uncommunicative Li carrying a large basketful of dirty clothes on their way to the wash. But what angered him was that Pantalacci's persecution of the unfortunate Celestial was absolutely cruel. He threw bottles of ink among the linen, stretched cords across the doorway so that Li tumbled over them, stuck him to his seat by a knife in the tail of his blouse, etc. Whenever he got a chance he would give him a sly kick, and call him a "pagan hound," and this he did invariably when he paid his weekly bill. Never was his washing done as he wished, although Li got it up most marvelously. For the least false fold he would fly into a most frightful rage and thrash the unhappy Chinese as if he were his slave.

Such were the ordinary "amusements" of the camp. Occasionally, however, they partook of a more tragic character. If, for instance, it happened that a negro employed in one of the mines was accused of stealing a diamond, the whole population turned out to escort him to the magistrate, and urge him along with their clenched fists. But the crime of receiving was held in greater detestation than that of stealing.

Ward, the Yankee, who arrived in Griqualand at the same time as the young engineer, had some cruel experience of the consequence of buying diamonds from Kaffirs. By law, a Kaffir on the works is not allowed to possess diamonds, or to buy a claim, or work on his own account.

No sooner was it known what the Yankee had done than an excited crowd rushed to Ward's canteen, sacked it from top to bottom, set it on fire, and would have hanged the proprietor on the gallows that willing hands were preparing, had not a dozen of the mounted police opportunely arrived and marched him off to prison.

And such scenes of violence were frequent amongst this very mixed and half-savage population. Men of every race jostled each other in the incongruous crowd. The thirst for gold, the drunkenness, the torrid climate, the disappointments, and the dissipation combined to set their brains ablaze. Had all been lucky in their digging they would perhaps have been quieter and more patient. But for the one or two to whom the chance would come of finding a stone of great value there were hundreds who barely vegetated—who scarcely earned enough to keep themselves alive, even if they did not fall into absolute penury.

This Cyprien soon began to see, and he was asking himself if it were worth while or not to continue so unremunerative a trade when an opportunity offered for him to change his plan of operations.

One morning he found himself face to face with a dozen Kaffirs, who had arrived in camp in search of work. These men had come from the distant mountains that divide Kaffirland, properly so called, from the Basutos. For more than four hundred and fifty miles they had travelled in Indian file along the bank of the Orange, living on what they found on their way—roots, berries, and locusts. They were in a state of semi-starvation,

and looked more like skeletons than living beings. With their emaciated limbs, long naked bodies, parchment-like skins, bony sides, and hollow cheeks, they seemed more likely to devour a beef-steak of human flesh than to do a day's work. No one offered to engage them, and they remained squatted by the side of the road, helpless, gloomy, and brutalised by misery and want.

Cyprien was much affected at their appearance, and took pity on them. He motioned them to wait a little, and then went off to the hotel, where he ordered a large potful of boiled maize-flour and some tins of preserved meat to be sent out, and then returned to amuse himself at seeing them enjoy these unaccustomed luxuries.

One would have thought they were shipwrecked sailors rescued from a raft after a fortnight's fasting. They ate so much that for their health's sake they had to be stopped to prevent their suffocation. Only one—the youngest and best-looking of the group—showed any signs of self-restraint, and—what was a still rarer thing for a Kaffir—he even went so far as to thank his benefactor. He stepped up to Cyprien, seized his hand, and solemnly passed it over his woolly head.

"What is your name?" asked Cyprien.

The Kaffir, understanding a few words of English, replied, "Mataki."

Cyprien liked his straightforward look, and conceived the idea of engaging him to work on his claim.

"After all," he said to himself, "it is what everybody does in these parts. Better for the Kaffir that he should have me for his master instead of some Pantalacci." And so—"Well, Mataki, you are looking for work, are you?"

The Kaffir nodded.

"Will you work for me? I will board you, find you in tools, and give you a pound a month."

Such was the customary rate, and Cyprien knew that he could not offer more without raising the whole camp against him. But he intended to make up the very poor pay with gifts of clothes, cooking utensils, and other things.

As his only reply, Mataki smiled, showed his white teeth, and again laid his protector's hand on his head.

The contract was signed.

Cyprien took him to his tent and gave him a flannel shirt, a pair of cotton trousers, and an old hat. Mataki could hardly believe his eyes. To see himself thus splendidly arrayed as soon as he arrived in camp surpassed his dreams. He knew not how to express his gratitude or his joy. He jumped and capered and laughed and cried again and again.

At the end of a week Mataki had picked up so many words that he was able to make himself understood, and Cyprien learnt his history. He did not know the name of the country where he was born, but it was in the mountains, towards the sun-rising. All he could say about it was that he was very miserable, and, like many other warriors of his tribe, to make his fortune he had come to the Diamond Fields.

What did he hope to gain? A red cloak and ten times ten pieces of silver! For the Kaffirs hate gold pieces, their prejudice against them being due to their having been used by the first European traders.

And what did Mataki, the ambitious,

think of doing with these pieces of silver?

His intention was to get a red cloak, a gun, and ammunition, and then to return to his kraal. There he would buy a wife, who would work for him, take care of his cow, and cultivate his mealie-field. Then would he become a great chief. Every one would envy his gun and his good fortune, and he would die full of years and respected. Nothing could be simpler.

Cyprien remained deep in thought after hearing the simple programme. Could he change it; enlarge the poor savage's horizon, and show him a better object in life than a red cloak and a shot gun? Or should he leave him in his ignorance and let him return to his kraal in peace, and live the life he hoped for? A serious question, which the engineer dared not solve, but which Mataki did for himself.

For as soon as the Kaffir had picked up sufficient of the language to make himself understood, he betrayed an extraordinary thirst for information. His questions were incessant; he wished to know everything—the name of each object, its use, and its origin. Then he devoted himself to reading, writing, and to ciphering. In short, his thirst for knowledge was insatiable. And Cyprien encouraged him, and every evening gave

him lessons. And these the young Kaffir would repeat to himself as he worked at the bottom of the claim, dealing mighty strokes with the pickaxe below, drawing the buckets up above, or sorting out the pebbles at the sieves. So well did he work that his example was contagious, and the men on the neighbouring claims made far more progress than they had ever done before.

On Mataki's recommendation, Cyprien engaged another Kaffir of the same tribe, whose name was Bardik, and his zeal and intelligence were equally appreciated.

Soon after Bardik's engagement, Cyprien had his first good find, a seven-carat stone, which he at once sold to Nathan the broker for twenty pounds. This was promising, and a miner who was only on the look-out for reasonable wages would have been content—but Cyprien was not.

"If I stay here for two or three months at this rate," he said to himself, "shall I be any better off? It is not one seven-carat stone that I want, but a thousand or two, or else Miss Watkins will be handed over to James Hilton, or some other worthless fellow."

Thus thought Cyprien as he returned to the kopje one sultry, dusty day—the dust that reddish, blinding cloud that hangs like a pall over the site of a dia-

"Helpless, gloomy, and brutalised by misery and want."

him an hour's lesson to help him on the road he had chosen.

Miss Watkins was also interested in his unusual eagerness, and undertook to

mond mine. Suddenly he stopped and stepped back horror-struck at what he saw in the yard of one of the isolated huts.

A man was hanging from the pole of

an ox-cart, which had been drawn up by the wall. The body hung like a plummet against a background of snowy white linen—motionless, lifeless, with the feet

"You? You were committing suicide, then, you scoundrel! And why?"
 "Li was too warm! Li was tired of it!" replied the Celestial.

'A man was hanging from the pole of an ox-cart.'

stretched to the ground, and the arms dropped limply at its side.

Cyprien was for a moment aghast. But as he recognised the Chinaman Li, hanging by the pigtail, which had been hitched round his neck, his astonishment gave way to pity. He did not hesitate very long. He sprang to the pole, caught the body in his arms, and cut the tail with his pocket-knife. That done, he carefully laid his burden in the shadow of the hut.

It was time. Li was not quite cold. His heart beat feebly, but still it did beat. Soon he opened his eyes, and, strange to relate, seemed to come to his senses as soon as he saw the light. His impassible face betrayed neither fear nor astonishment at emerging from so horrible a trial. He seemed as though he had been awakened from some gentle sleep.

Cyprien made him drink a few drops of vinegar-and-water that he happened to have in his flask.

"Can you speak now?" asked he, mechanically, forgetting that Li could not understand him.

Li, however, gave an affirmative nod.

"Who hanged you, then?"

"I did," replied the Chinaman, as if he had said the most natural thing in the world.

And then he shut his eyes, as if to escape further questioning.

It now struck Cyprien for the first time that the Chinaman was not supposed to know the language.

"You speak English?" asked he.

"Yes," answered Li, lifting his eyelids, or rather the two oblique button-holes alongside his nose.

The look he gave reminded Cyprien of that ironical glance which had surprised him on the coach to Kimberley.

"Your reasons are absurd!" he said, severely. "People do not commit suicide because the weather is too hot! Speak seriously. There is something in all this, I know. Has that Pantalacci been doing anything to you?"

The Chinaman bowed his head.

"He threatened to cut off my pigtail," said he, in a low voice, "and I am sure that he would have done so in an hour or two."

At the same moment Li perceived the very pigtail in Cyprien's hand, and saw that the misfortune he dreaded above all things had come to pass.

"Oh! sir! what! you! 'You cut it!'" he screamed in terror.

"It was necessary to do so to prevent your being strangled," said Cyprien; "but it is of no consequence to you in this place. Be calm!"

The Chinaman seemed so broken-hearted at the amputation that Cyprien, fearing he might make another attempt on his life, took him along with him.

Li followed without a word, sat down near his rescuer, listened to his reprimands, promised never to renew the attempt, and, under the influence of a cup of hot tea, even favoured him with some scraps of his biography.

He was a native of Canton, and had been brought up in an English commercial house. From Canton he had gone to Ceylon, thence to Australia, and thence to South Africa. Fortune had never smiled on him. The laundry trade had been as unprofitable as the twenty other trades he had tried his hands at. But Pantalacci had simply rendered his life insupportable, and to escape his persecution he had made up his mind to hang himself.

Cyprien comforted the poor fellow, promised to protect him against the Neapolitan, gave him all the dirty clothes to wash that he could find, and sent him away contented at the loss of his capillary appendage, and free from superstition regarding the consequences.

(To be continued.)

ARMOUR IN HISTORY AND ROMANCE.

CHAPTER VII.

THE art of using acids to corrode steel and leave designs in relief, and of inlaying the bitten-out parts with enamel or precious metal, was in Henry VII.'s time much in vogue. Many examples exist. In the Tower of London we have the suit of armour presented to Henry VIII. by the Emperor Maximilian as a wedding present on his marriage with Katharine of Aragon. The badges are engraved on the suit, with the initials of the bride and bridegroom united by a true lover's knot. The suit is elaborately ornamented with pictures from the lives of the saints. A novelty in this armour is the introduction of the "Lampoyrs," an imitation in steel of the skirts of a coat.

Louis van Leyden practised etching in 1509, having learned the art from a maker of armour who was accustomed to execute ornamental work on the metal with nitric acid. The Asiatic art of inlaying weapons with gold was introduced about the same time, and used with great effect by the celebrated Benvenuto Cellini. Sword-blades so adorned were called in the French language "damasquinée," from the practice having originated.

at Damascus. Our engraving (Fig. 39) is copied from the etching by Albrecht Dürer, known as "The Knight, the Devil, and Death." The knight is depicted in a very

These were metal plates that covered the upper part of the arms, chest, and shoulders. The older fashion of a salient ridge or tapul in front of the breastplate reappeared, but the

Fig. 39.

rich suit of fluted armour. The sallet has the visor raised. It is of sharp volant form, but in Queen Elizabeth's time it became more obtuse. The pauldrons have raised guards to protect the throat; the breastplate takes the globular form, and has a lance-rest "or queue" attached. On the right side, joined to the waist, is the lampoy, or coat-tail of steel, which in this illustration is not so voluminous as that in the suit of Henry VIII. The toes of the sollerets are at this

greatest protuberance was placed lower down, as if to imitate or cover the Punch-like peascod doublet worn at the time.

As the skill of the armourer developed, the knight was made almost impregnable in a casemate of steel, thus justifying James I.'s remark, that armour was an admirable invention which preserved a man from being injured and made him incapable of injuring any one else. A good idea of the strength of tilting armour in the sixteenth century can be gathered from the suit of Charles Brandon, Duke of Suffolk, of the date 1520, now in the Tower of London. The volant piece in front of the helmet has a curious additional contrivance of grated and guarded apertures. The breastplate is strengthened by the grand guard, and the left arm carries a large elbow-plate to act as a shield. The brassards are splinted at the inner bend of the arm, and below them is a long gauntlet. The sollerets are articulated. The suit weighs a hundred pounds, and in addition to this the poor horse had to bear a saddle-guard as well as the armour for his head called the chanfron, and that for his neck called the manefare.

A knight unhorsed must have been as helpless as a turtle on its back, for he was quite unable to rise or free himself from his armour without assistance. Philip de Comines writes that after a battle, at which he himself was present, "the camp-followers and servants flocked about the men-of-arms who had been overthrown, and slew most of them with the hatchets they used to cut wood; with which weapons they brake the vizards of their head-pieces and cleve their heads."

Fig. 41.

period no longer "pointed," but are almost square. The illustration is useful as it bears its date, 1513.

About this time the roundels protecting the armpits, as shown in Figs. 28—38, had disappeared, and pauldrons were substituted.

Our illustration on page 109 (Fig. 40) is a full suit of armour of the time, which will serve to explain some of the recent terms we have been using. The application of gunpowder to small arms necessitated a helmet that was free for the sight, and consequently we have the casque and the morion. The casque we illustrate (Fig. 41). It was used by the arquebusiers in 1560, and a buffe or chin-piece was strapped in front when occasion required. We also have shown two morions. Fig. 42 is the cabasset or peaked morion (1555—1575), our example being from a richly-engraved specimen in the British Museum. In Fig. 43 we have a three-corded comb specimen, with a fleur-de-lis and scroll pattern in repoussé work.

In the same collection is a specimen of the spider-cap (Fig. 44) said to have been used in a horse regiment formed by Henri Quatre. When not in action the bars could be turned over and the ends fitted under the disk at the top.

Gunpowder caused armour to be a mere encumbrance. In the reigns of Elizabeth and James I. it was probably little used in warfare, but the fashion was retained as the costume and insignia of a soldier and a gentleman. It was also used as such for monumental effigies. In the reign of Queen Elizabeth suits of armour were simplified. The ordinary breastplates were made much thicker in order to be bullet-proof, and projected downwards in conformity with the eccentric shape of the Punch-like waistcoat or peascod doublet of the time. The taces were made of one plate each, but were marked in imitation of many. At the close of James I.'s reign armour terminated at the knees. At this period gentlemen wore corslets. By permission we engrave (Fig. 45) a

Fig. 45.

portrait of Colonel George Goring, which shows the custom of wearing a handsome corslet with full dress.

Our next illustration is that of a pikeman in the part armour of the latter half of the sixteenth century (Fig. 46). A statute of Charles II. directed that pikemen were to be armed with a pike made of ash, not under sixteen feet in length, and also a back and breast piece, a head-piece, or pot-cap, and a sword. According to Planché, the pike was introduced into France by the Swiss in the time of Louis XI.,

and soon became an infantry weapon throughout Europe. Pikemen formed a principal part of the English army from the reign of Henry VII. to that of William III.

the limits of Westminster Hall by two trumpeters with the arms of the champion on their banners, by the sergeant-trumpeter, and by two sergeants-at-arms

herald attending the champion in the following terms:—

“If any person, of what degree soever,

Suit of Charles Brandon, Duke of Suffolk.

Taces were then abandoned, and the remains of armour retained in our army were the helmet and corslet of our horse soldiers and the epaulettes on the shoulders of men of rank in the army and navy. A curious remnant of chivalry was displayed at the coronation of King George IV. It transpired that the manor of Scrivelsby, in Lincolnshire, belonging to the Dymokes, was formerly held on the tenure of attending each monarch on horseback at his coronation, and challenging all comers as the King's champion. The holder of the manor at this time was a clergyman, who, being in holy orders, could not appear as a warlike knight. He applied, however, to the authorities for permission to allow his son, who was under age, to act as champion. This after some demur was allowed, and the ceremony took place in the following order:—Mr. Dymoke, accompanied on the right by the Duke of Wellington and on the left by Lord Howard of Effingham, rode habited in polished steel armour, with plumes on his armet, and his horse also armoured with testiere and chanfron for the head and jaws. He was ushered first within

with maces. An esquire in half-armour was on each side, the one bearing the champion's lance and the other his shield. The three horsemen were followed by grooms and pages. The first challenge was given at the entrance of the hall, the trumpets having sounded thrice. It was read by the

high or low, shall deny or gainsay our Sovereign Lord King George the Fourth, of the United Kingdom of Great Britain and Ireland, Defender of the Faith, son and next heir to our Sovereign Lord King George the Third, the last King, deceased, to be right heir to the Imperial Crown of this United Kingdom, or that he ought not to enjoy the same, here is his champion, who saith that he lieth and is a false traitor; being ready in person to combat with him, and on this quarrel will adventure his life against him on what day soever shall be appointed.”

After pausing a few seconds the champion drew off his gauntlet and threw it upon the floor. This challenge was repeated halfway up the hall, the gauntlet each time being restored by the herald to the challenger amid applause and vociferations of, “Long live the King!” The family of the Dymokes is now extinct. The ceremony did not take place at the coronation of our present Queen, but she wore a pair of silken gauntlets, embroidered with the Duke of Norfolk's cognizance, presented by him as holding the post of Earl Marshal.

(THE END)

Fig. 46.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XI.

FEATHERSTONE and Tommy had been on very good terms lately, thanks to the incident which had occurred in the gymnasium. But then Featherstone was on good terms with everybody in the lower school, so Tommy still lacked a chum. It was scarcely to be expected that a boy who was so popular as Featherstone should take any special trouble to make friends with a fellow who had never done him any good turn in particular, and whose friendship would bring no very great *kudos* on its possessor.

However, an episode occurred one day which rather changed the face of affairs, and made Soady easy in his mind as to Tommy's having a friend when he had left St. Mary's. It was in this wise.

Tommy was a careless boy; his books were being constantly mislaid, and had it not been for Soady's kindness he would have been continually floored for not knowing his lessons, owing to a lack of material to work upon.

There were certain books which Soady could not supply, as he used

different ones. Amongst these was a History of England, smaller and more elementary than that used in the upper forms.

Tommy was weak in history, and wished that England had always been a

republic, so that he might have been spared learning the kings, with their extremely desultory dates. He disliked the whole subject, and used to cram his lesson just before going in and trust to luck, which sometimes favoured him and sometimes did not.

On the occasion in question he was leaving his preparation as usual to the last quarter of an hour, when he found, to his horror, that he had lost his History.

"I'm in for it this time!" he thought. "Wonder if Featherstone will lend me his? I was floored yesterday; it won't do to come to grief two days running."

After a short search Featherstone

"He wrenched up the lid desperately with a chisel."

was discovered. He willingly lent his book.

"Mind you take care of it, Tommy," he said; "I wouldn't lose that book for a trifle. It belonged to Craven before he got into the first form."

Tommy did not know what added value that fact gave. He was not aware that Craven was a genius in the matter of caricatures, and that it was his delight and practice to embellish his books with the productions of his talent.

Tommy ran away with his History, and, getting into his favourite position along a form, opened it with the intention of devoting his attention to the

deeds of Richard I. But the first glance made him oblivious of his lesson. The volume was illustrated under the direction of the author (Dr. William Smith), but its former possessor appeared to think that the engravings could be improved upon. Beardless monarchs were made to resemble the Emperor Napoleon; pipes were inserted in the mouths of grave senators; the vessels were peopled with most ridiculously incongruous sailors—Craven's pencil and pen had run riot in every direction. Tommy revelled in the fun, and utterly forgot everything in the excitement of turning over the leaves in search of new treasures.

Then he came across a page on which was written, "Which would you prefer—to be a greater fool than you look, or look a greater fool than you are? For answer, see page 102." This time-worn riddle was new to Tommy, who eagerly turned to page 102. There he was directed to "see page 14;" on page 14 there was a further direction to 95, and so on for about half a dozen references. Tommy patiently turned them all up, finding his reward at last on page 17, the words, "Both are impossible!"

This was a sell; the book was full of them. Sometimes there was a footnote to a statement to the effect that the author must be mistaken; dates were altered to others more fitting Craven's ideas of chronology. The book was indeed a comic History of England, designed, as Craven had stated on the fly-leaf, "to gild the path of the wayfarer up Parnassus with pleasurable aids and ingeniously contrived obstructions, on an entirely new principle, which had not met with the approval of the heads of any of the colleges of the United Kingdom or elsewhere."

Tommy was still immersed in his treasure when the bell sounded. School-time, and he had not learnt a word! He ran to his place and fixed his earnest attention on the page, trying his best to engrave a few facts on his memory which might by some fortunate chance tide him over.

Of course, Mr. Pickering was more punctual than ever, and the sharp way in which he cried, "Shut books!" left no alternative. Tommy gave a last glance, and fixed in his mind the name of the immediate predecessor of the monarch under consideration—Richard Cœur de Lion.

"Got my book all right?" whispered Featherstone.

"Yes. What a topper it is!"

"Rather! I'll show it to you after school—some things you wouldn't see unless I pointed them out."

Tommy was successful in concealing his ignorance during the early part of the lesson, but the questions came rapidly at the close, and he feared a catastrophe. When, however, the point he was requested to settle was the name of Richard's predecessor his relief knew no bounds; he was safe for the day, for there was no likelihood of another round.

"Name of Richard's predecessor? You, Scott."

"Henry the Third, sir," replied Tommy, confidently.

"Wrong; don't you even know the order of the kings yet?" asked Mr. Pickering, sharply.

"It's Henry the Third, sir, I'm sure,"

said Tommy. He was certain, quite certain of it—it was the very last thing he glanced at as he closed his book.

"What do you mean by contradicting me, sir?" exclaimed the master. "Take care!"

But Tommy, to every one's surprise, persisted.

"It's Henry the Third in my book, sir, I'm certain."

Had he seen Featherstone's eye he would never have said it. It was too late now.

"Let me see your book," said Mr. Pickering.

Tommy became instantly conscious of what a mistake he had made. He hesitated.

"Your book, sir!"

There was no help for it; he handed it up. Mr. Pickering opened it, and looked annoyed, turned over a few leaves, and his face did not look any pleasanter. However, he found the page required, and there, surely enough, was Henry III. preceding Richard I.

Mr. Pickering held it up to the light. The explanation was simple then. Some one had deftly altered Henry II. to Henry III. by the addition of a stroke.

"Scott," said Mr. Pickering, "I don't know where you managed to pick up this History, but I don't think it advisable for you to continue studying from it. You will bring a new one into class to-morrow, one that is not so embellished as this one, and that is more reliable. The cost is three-and-sixpence, which I will regard in the light of a fine for disfiguring your books. If I see this one again I shall put it behind the fire."

He handed the volume back, to Tommy's relief. An hour later school was dismissed. Featherstone took the earliest opportunity of getting to Tommy's side.

"Tommy, you're a brick!" he said; "if Pickering knew that was mine he'd have torn it up; he let you down easy because you were a new boy."

"Three-and-six!" remarked Tommy, dolefully.

"Never mind, I'll stand half-a-crown of it."

"No, you shan't; 'twas all my fault."

"No, it wasn't; I ought to have told you that that fellow Craven altered it all through. I was afraid you were going to say it wasn't yours, and then I should have lost it. But you didn't own up, and I'll stick to you."

Tommy was gratified beyond measure; he liked Featherstone, and was flattered to find his pluck in holding his tongue had met with such recognition. Three-and-sixpence, though it was a large sum, was well spent in winning a friend.

But fortunately the three-and-sixpence was not required. The lost history book turned up the next morning in the Rumage-room, where Tommy had deposited it whilst on a visit to his hamper, and then forgotten all about it.

CHAPTER XII.

WEDNESDAY came, and Melhuish was no nearer getting the money he required. The terrible feeling of despondency which had taken possession of him had prevented his feeling any

interest in work or play; the result was that he had incurred the Doctor's severe displeasure in class, and had had a slight quarrel with Lang.

Garland, with whom he had never been on terms of the slightest intimacy, was the only one now who seemed inclined to take any notice of him. But Melhuish had repulsed his overtures surlily, and Garland ceased to trouble him. Melhuish, however, repented his folly, for possibly Garland might have some money to lend. However, he found out that he had very little, so he took no steps to try and borrow it. A little money was no good; he must have several pounds.

There was only one course open to him now—to run away. He made up his mind to this, and, having done so, felt more at ease. He found out the times of the trains, and decided to catch one which left St. Mary's for London at 5.10. Tea was at six, so till then no one would want to know where he was, and by that time he would be out of reach.

What he should do when he reached London he had not settled. He had a vague idea of going to America. But all that he must leave. At present the one thing necessary was to get away from St. Mary's.

He had exactly half a sovereign of his own, more than enough to pay the fare to London. But he must get some more money. He knew how to manage that.

Ferguson was the football treasurer, and kept the cash in his desk, which he was always careful to lock. A very methodical fellow was Ferguson; there was no chance of his leaving his desk open by mistake.

Melhuish resolved to take a pound or two from the football fund. He believed he could force the desk open. Of course the robbery would be found out in the evening, but that wouldn't matter to him; he would be out of reach.

By watching his opportunity after school he could find the first-form room empty and open the desk undisturbed. Then he could slip away to the station in safety, getting out a little before the gates were shut, which was done at five punctually by the house porter.

But after school the boys did not seem in a hurry to leave the room. Garland hung about reading, and Ferguson kept dropping in and out. Melhuish began to grow anxious. Unless they speedily took their departure he would not have time to do what he wished and yet catch the 5.10 train. He was in a fever of anxiety, but at last Garland shut up his book and went out of the room.

Only Ferguson was left. At length he opened his desk, took out a fives ball, and departed. The instant he was gone Melhuish ran to the desk, wrenched up the lid desperately with a chisel he had procured, and opening one of the chamois leather bags in which Ferguson kept his cash, took out three sovereigns and a half-sovereign. As he did so he heard footsteps outside. He had just time to thrust the money in his pocket and shut the desk when Lang came in.

"Hullo, Melhuish, you all alone?"

"Yes," was the short reply. Lang supposed he was still unforgetful of the quarrel of two days ago.

"Don't let me disturb you," said Lang, ironically.

A sudden thought struck Melhuish.

"Have you a couple of stamps you could let me have?" he asked.

This sounded like a step towards a reconciliation, which Lang rather wanted.

"I think I can manage it," he replied.

"Here you are."

"Thanks. Can you change half-a-sov. ? I've no coppers."

"Oh, never mind; any time will do."

"I rather want change if you have got it."

Lang cleared out his pockets and made it up, rather to his own surprise. Melhuish gave him half-a-sovereign, and then, with very short thanks, left the room. Only ten minutes to get to the station and take his ticket. He heard the clock striking five.

He jumped down the stairs and rushed across the quad. Old John, the porter, was just shutting the gates. No one was allowed to go out after five, though boys were permitted to come in till half-past.

"John, let me through! I must run down to town!" exclaimed Melhuish, hurriedly.

"Too late, sir; the clock's struck."

"It's fast, John; you know it is. Look here, John, you let me go; I'll keep out of sight."

He thrust a shilling into the janitor's hand. Old John was not hard-hearted, so let him slip out. He was safe now; he could do the half-mile to the station easily in seven minutes and leave a minute to take his ticket.

"How lucky," he thought, "to remember I hadn't a farthing change. If I hadn't got it from Lang I should never have managed to get out. Who could have calculated on drawing it so fine?"

He met no one on his way to the station. He fancied the booking-clerk looked curious when he asked for a ticket to London, but he did not say anything. The train was a few minutes late, which were spent anything but pleasantly by Melhuish. When it puffed into the station he took his seat in a deserted third-class compartment, and sank out of sight.

A couple of hours later he stood on the platform of Euston, in London. He had left school for the world.

(To be continued.)

GREAT SHIPWRECKS OF THE WORLD.

"CAST AWAY ON THE AUCKLAND ISLANDS."

THE Grafton, which sailed from Sydney on November 12th, 1863, was wrecked on January 3rd, 1864, on one of the islets of the Auckland Isles. The master and two of the crew arrived at Port Adventure last month in a small boat of their own building. Such is the official record of the wreck of the Grafton as appearing in Lloyd's list for October 17th, 1865.

Among the annals of the sea few more interesting stories exist than that of the loss of this ill-fated schooner. The captain's diary written up day by day in seal's blood during the twenty months' stay on the island, and published under the title we have chosen for our heading, is as enthralling as Robinson Crusoe. The plain straightforward narrative appeals so directly to the reader that, held as by the eye of the ancient mariner, he cannot escape. The quiet way in which Captain Musgrave sets to work to make his people comfortable under such untoward circumstances, teaching the men to read and write, and employing himself in surveying the harbours, and taking natural history notes, is something seldom met with in the history of shipwreck; the tinkering, tailoring, cobbling ingenuity of the mate, working at his makeshift anvil from nine in the morning till long after midnight as he forms out of the old iron the bolts and nails necessary to fit the crazy dingy for her two hundred and forty miles' voyage across the stormy ocean, makes easy conquest of our sympathy and admiration; while the curious fact of two shipwrecked crews being on the island at the same time unknown to each other renders the experience unique.

On New Year's Day, 1864, the schooner was caught in a violent gale off the Auckland Islands. Having in vain endeavoured to face it she was run for safety into Carnley's Harbour in the large island. The wind shifted slightly so as to blow right into the harbour, and on the 2nd of January one of the anchor chains went, and the other anchor, the best bower, began to drag until it brought her up about a couple of cables' length from the shore. The gale increased very much, and the anchor began to drag again, every heave of the swell lifting the vessel nearer the shore; and at midnight she struck.

The sea made clean breaches over her, the gale was terrific, the pieces of her keel came up under her lee and the water rushed in like a boiling spring. About two o'clock, when the water had risen to the top of the cabin table, the pumps were abandoned and provisions got on deck. When daylight came the dingy was launched, and, taking the mainsail and gaff with them to serve as a tent, the crew slipped ashore. There were only five in

all—the captain, the mate, and three seamen.

The storm continued for a week, and during that time the castaways lived under the tent and slept on the wet sand. But on the gale moderating a journey was made to the ship, which had not broken up, and sails and spars were brought ashore to make a house to spend the winter in. For the Auckland Islands at that time were uninhabited, and Musgrave expected to remain unrescued until the coming summer. Round the harbour grew plenty of timber, and there was a creek of excellent water. Of meat there was at that time no lack, for thousands of seals haunted the place, and at night could be heard roaring about the woods like wild cattle, the seal being much more noisy and spending much more time on the land than is usually supposed.

On the 19th of January, when an expedition was made down the harbour to plant the flagstaff and hoist the flag in signal of distress, hundreds of seals, black and tiger, were afloat on its waters, the black on one side, the tiger on the other, keeping well apart and ignoring each other except on one occasion when a regular dog-fight arose between a single representative of each species. Birds there were in plenty, green parrots—on one occasion a nest of green parrots was found, and the young ones reared—and robin redbreasts so tame that they came to be stroked, widegeons, and ducks, three different species of songsters, and hawks, five of which were shot to the great comfort of the other birds, who became even tamer after the death of their enemies, as if in recognition of the kindness that had been done for them. So, as in the case of Alexander Selkirk, there was little chance of food failing the castaways.

On the 24th of January some of the party set out to explore the mountain, and met with seal tracks four miles inland, while a seal itself was met with three miles away from the sea. From the summit of the hill a small harbour was descried away to the northward, but the steep granite precipices formed nearly the whole of the coast line. On the top the hills were covered with bog, but at their feet was the patchy bush of iron-bark and shea-oak.

A fortnight after this expedition, during a gale that arose suddenly, the boat got stove in. The men were in despair, but as soon as possible she was repaired and ways were laid down for beaching and launching her. Then, to avoid all risk of provisions becoming scarce, the party killed a supply of birds and seals and salted them; and now work began in earnest on the house, with the only tools saved from the wreck—a hammer, an axe, an adze, and a gimlet.

The house was twenty-four feet long and sixteen wide. It was seven feet high at the walls, and fourteen at the ridge, and the corner spars were let a yard into the ground. The walls themselves were made of timber from the bush, let a foot into the ground, and having the spaces between each thoroughly thatched with bundles of grass. The floor was boarded with the ship's planks; the door was an old one, the windows came from the cabin. The fireplace was of stone, and had walls a foot thick up to the roof, beyond which the chimney was continued in copper and zinc. Stretchers were built up inside for the men to sleep on, and there was a large dining-table seven feet by three with benches along the sides and a keg at the end for the chairman. At one end was the captain's table, with his writing-desk and chronometer; at the other was the cook's table, with his tools and crockery. A few shelves and a looking-glass completed the furniture of the interior, and trenches all round two feet deep ran the water away from the exterior, and made everything dry and snug. In this house over eighteen months were spent, whose history was varied with the usual desert island incidents we so frequently meet with in romance.

A root was found which, on being tried, proved an excellent substitute for potatoes, and became included in the dietary. A new method of curing sealskins was invented. They were washed in strong lye made from ashes, scoured with sand, rolled tight, and beaten till they were soft enough to serve as blankets. One of the trees was found to yield a bark well adapted for tanning purposes, and in the tan made from it sea-lion skins were steeped, and gave the castaways excellent leather for their boots and clothes. Fish of all sorts began to come in to the harbour, a good haul was made, and a shoal of anchovies, accompanied by Australian mutton-birds, offered another variety in the food. In April a deserted camp was discovered on Figure of Eight Island, with the traces of a fire and an old file. A few days later dogs were seen in the bush, and afterwards were heard barking. The cliff at Flagstaff Point was painted white, and a blue N to direct the folks who saw it to steer to the north was added, and a bottle containing instructions was tied to the flagstaff. Many exploring expeditions took place among the chasms and precipices, and the Giants' Tomb, a ridge of rock 1,800 feet above the sea, with a cave at the top, was thoroughly overhauled.

In this way twelve months passed, and no rescue came, and then it was decided to build a cutter of about ten tons' measurement, and attempt to reach Stewart Island. The Grafton had been built of greenheart and

Cast away on the Auckland Islands.—See p. 123.

copy out of the timbers of an old Spanish man-of-war, so that the wood was hard and heavy and sorely trying to the tools. For the keel of the new ship the mainmast was used, and the blocks were laid down and timbers cut out.

The old ship had little copper in her; nearly all her fastenings were of iron, and Raynal, the mate, undertook to do the blacksmithing work, and out of these old iron bolts to produce the tools and spikes necessary for the new. For a time he succeeded. An iron block did for an anvil, and some of the bush was burnt underground for charcoal to serve as fuel.

The rusty old file found on Figure of Eight Island was ground down smooth, and fresh teeth were cut in it with the chisel, though unfortunately with almost the last cut it broke two inches off the tang. Shift was made with it, however, to cut teeth in a piece of sheet iron and form a saw. In a month keel, stem, and stern were ready for bolting, and Raynal had out of the old iron bolts and belaying-pins made the tools required. Chisels and gouges had been turned out to order, but now the great failure was to come. To bore the wood for the bolt-holes augers were necessary, and these he tried in vain to finish. He nearly succeeded each time, but at the last twist the ends snapped off. With a heavy heart he had to give in, and the building of the cutter had to be abandoned.

There remained the old clinker-built boat, twelve feet on the keel, in which they had made their exploring trips. It was resolved to patch her up, to lengthen her a yard, and raise her a foot, and make the dash for safety in her. The work was soon begun, and went on unceasingly from daylight till half-past nine at night, for to the boat they were to a certain extent indebted for their food, and while it was in hand they had to betake themselves to their salted provisions and vary their diet with the few birds that at that time were visiting them in the bay.

Soon after starting on the work the gimlet broke, and this was successfully mended by the mate, who worked so hard at his forge that before he had finished he had turned out one hundred and eighty clinch bolts and seven hundred nails and spikes, without counting the old stuff he had put straight. Now, however, there arose another difficulty. The planks of the old ship would not bend on to the boat, steam them as long and as thoroughly as they could; and so the neighbouring trees had to be cut down, and out of the shea-oak planks had to be got by means of Raynal's sheet-iron saw.

And all this time a constant record of the adventures and disappointments was kept by the captain—in seal's blood, for want of ink. And, in addition to the record, a long essay on the habits of the seal was drawn up, from which, as being the history of an animal written in its own blood, we must find room for an extract.

"It might be supposed," says Captain Musgrave in his journal, "that these animals, even when young, would readily go into the water, that being one of their natural instincts, but, strange to say, such is not the case; it is only with the greatest difficulty and a wonderful display of patience that the mother succeeds in getting her young in for the first time. I have known a cow to be three days getting her calf down half a mile and into the water; and, what is most surprising of all, it cannot swim when it is in the water. This is the most amusing fact. The mother gets it on to her back and swims along very gently on the top of the water, but the poor little thing is bleating all the time, and continually falling from its slippery position, when it will splutter about in the water precisely like a little boy who gets beyond his depth and cannot swim. Then the mother gets underneath it, and it again gets on to her back. Thus they go on, the mother frequently giving an angry bellow, the young one constantly bleating

and crying, frequently falling off, spluttering, and getting on again; very often getting a slap from the flipper of the mother and sometimes a cruel bite. In this manner they go on until they have made their passage to whatever place she wishes to take the young one to, and here the young ones remain without going into the water again for perhaps a month, when they will begin to go in of their own accord; but at first they will only play about the edge, venturing farther by degrees, and until they are about three months old if surprised in the water they will immediately run on shore and hide themselves, but they always keep their heads out and their eyes fixed on the party that has surprised them, imploring mercy in their most eloquent language."

On Friday, June 23rd, 1865, the boat was ready, sails were bent, and all was complete. Four days afterwards she was launched—and proved so crank as to be dangerous. Her rig was altered from that of a cutter to that of a lugger with a jib; her ballast was rearranged, and then she did better—and all was ready to start. Starting, however, was no easy matter, for of the three men who, with the captain and the mate, formed the complement, two had to be left behind owing to the boat not being big enough to hold them. The men were afraid to go and afraid to stay, and would not let the captain leave. At last all difficulties were surmounted; a seaman named Harris and the cook, Folger, were left behind, and on the 19th of July the Rescue—such was the name of the boat—set sail in the first squall of a south-west gale, which came on in full force after they had been about twenty minutes at sea. For five days and nights—during the whole of which no one slept, and the pump had to be constantly kept going—those three men took their frail craft through the breaking waves.

At last they reached Port Adventure, in Stewart's Island, and thence five weeks afterwards Captain Musgrave returned to the Aucklands in the Flying Scud in search of the two men he had left behind. As the cutter made her way down the coast a mysterious smoke was observed over the hills. The men were found, almost beside themselves with joy at being rescued. And then, as they knew nothing of the smoke, a search was made for its origin. The source of the smoke was not found, but in a bay to the northward of Carnley's Harbour they came across an eloquent token of another wreck. A little way up from the beach was an old ruined hut that had fallen to pieces round the bedstead that had been built within it. On the bedstead, in the full light of the day, lay the dead body of a man dressed in oilskins and jersey. By his side were two bottles of water, one full, the other empty, and near him was a heap of limpet and mussel shells, showing what had been his food. There he lay, in the broad sunshine, with his legs across as he had died—starved to death! His flesh had gone in places, and the features were unrecognisable; but on the slate he held in his hand he had scrawled a few words, only one of which, "James," was now decipherable. Solemnly the Grafton men buried him close to the precipitous cliffs, in deep silence, broken only by the cry of the sea-birds as they swept round the bay and the beating of the waves as they foamed on to the rocks. Whence he had come was then a mystery to them, as it was obvious that the wreck from which he had been cast must have taken place while they were in comparative comfort at their hut. This mystery was never solved, but a short time after their return to New Zealand they learnt that on the 10th of May, 1864, during a storm duly chronicled in Captain Musgrave's seal's-blood journal, another wreck had occurred on the island—that of the Invercauld, from Melbourne to Callao. The Invercauld was a ship of over eight hundred tons burden, commanded by Captain Dalgarno.

Of the twenty-five persons on board when the clipper was suddenly driven among the breakers, two boys and four seamen were drowned. The night was intensely cold and dark, and the nineteen survivors had to creep together under the cliff to keep themselves warm, while the spray dashed over them. In the morning it was found that only two pounds of biscuit and three pounds of pork had been washed ashore from the wreck, and this was all the provisions they had amongst them.

The almost perpendicular cliffs were scaled in search of help; water and roots were found, and a journey was made through the scrub towards the highest point of the island. Nothing was seen, however, of the Grafton people, nor did the castaways in Carnley's Harbour discover any trace of the Invercauld's, although, thanks to the steward having saved a box of matches, fire was not unknown to them. A return was then made to the beach, a hut was built of the timbers cast up by the sea, and a miserable life was led on seal flesh and limpets. The seal flesh soon gave out, the shell-fish on the rocks were all eaten, and one by one the men died. By the end of August, of the nineteen three only were left—the captain, the mate, and one seaman—and these moved off to the northward. In great misery they kept body and soul together until, twelve months and ten days after the wreck, they were picked up by a Portuguese vessel that had put into the bay in the hope of finding some one able to repair a leak. The captain with his two companions was taken on board the Julian and landed at Callao, to learn, a few months afterwards, that during the whole time he had been on the island the Graftons had lived on the other side of the ridge, and that while he was starving food existed in plenty in Carnley's Harbour. Had he only led his crew to the southward instead of to the north all would have been well. "On what trifles hang the lives of men!" The dogs had been left behind by the old settlers before they deserted the island. Of the mysterious smoke no explanation has yet been given.

OUR NOTE BOOK.

A BRAVE STAND.

WE learn from the Continent, where the keeping of a Christian Sabbath is almost wholly disregarded, and where, therefore, it requires not a little moral courage to set oneself against the current, that the soldiers belonging to the Young Men's Christian Associations in the Val de Travers have formed amongst themselves a special rifle corps, whose exercises shall not take place on Sunday. The Council of State of Neuchâtel have granted their consent.

A VETERAN FRIGATE.

THE famous British frigate Shannon, which in 1813 fought the historical sea duel with the United States sloop-of-war Chesapeake, is still afloat. Long ago she was reconstructed for the merchant service, but her hull is substantially the same to-day as it was eighty-four years ago, the date of her birth, or her launching. Her last public service was the transporting of troops to and from India. Latterly she has been taking a cargo of chalk from England to New York. She is about 1,300 tons, and on her stern she displays what is said to be a capital likeness of Sir Philip Broke.

A HELPFUL THOUGHT.—"Is your God a great God or a little God?" mockingly asked an infidel of an old Christian woman. There was a pause, and then solemnly upraising her hand she replied, "My God is so great that heaven and earth cannot contain Him, and He is so small that He can dwell in this poor heart!"

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER III.—SAILING CANOES.

A Good Run.

THE Rob Roy was the first canoe of a safe and handy type, the canoes in existence before its appearance being generally exceedingly shallow and very dangerous, for although they were partly decked, they were left open amidships for the reception of the occupant, the fore part of the deck stopping short some nine or ten inches from his feet, and it was impossible to keep out the water if from any accident the gunwale of the canoe was forced under water. Such canoes are even now used in some places, and the general type of canoe let out for hire at most boat-houses is of this description, Rob Roys being in general only constructed for private owners.

Owing to the shortness of the Rob Roy type, which was requisite to give sufficient handiness, extreme speed could not be attained "under paddle," and to meet this want the Ringleader canoe was designed, of extreme length as compared to the Rob Roy.

For the purpose for which it was intended it answered very well, and was capable of being paddled at a great speed, but in the Rob Roy races, which are a compound of paddling, sailing, drawing the canoe over a certain length ashore, jumping over a ditch, and climbing over a hedge hauling it after, and sundry other evolutions, finishing up with an upset and a swim in clothes, towing the canoe, the Rob Roy type came off victorious, being possessed of more all-round qualities.

The Ringleader, which was built on the axiom that "length means speed," is not much seen now, and canoeists have as a rule gone in for craft that can carry canvas and go to windward under it; and in considering them we come to sailing canoes, such as the Nautilus, Pearl, and Mersey canoes. These canoes, which can be readily paddled on occasion (with the exception of the latter type), depend more on their sails than the paddle while there is any wind at all, as they can work to windward under sail faster than they can be paddled, which is not the case with the Rob Roy type, which is a sort of compromise, being neither a racing paddling canoe of the Ringleader type nor a

sailing canoe, but a canoe that can be easily paddled and carries sail on suitable occasions.

The great difference in the two forms of sailing is this: Supposing in a Rob Roy you have a fair wind, either a run or a ratch; well, all you have to do is to up sail and off you go merrily enough; but if the wind be dead against you, then perhaps with a specially good boat of the type you might draw a little to windward close-hauled, but it would not be much, and would be such slow work that you would soon find that if you wanted to progress against the wind you would have to douse sail and get up steam.

Now, in a sailing canoe all is quite different. She will outpace the Rob Roy off the wind at such a rate that in no time the travelling canoe will be where the little boat was, "a long way astern," and when close-hauled the Rob Roy would never see the way she was going, for the sailing canoe would, thanks to her centreboard, lie as close to the wind as a cutter, and with patent reefing-gear could snug down at a moment's notice so as not to care how many hands were at the bellows, and if blowing up a gale of wind a Mersey canoe with mizen set in place of the main or with other snug sail would go over the seas like a duck; but—and there is always a "but," for it is not easy to find perfection—you would not much like the job of using a sailing canoe for travelling, not only on water, but over hedges, on railways, and occasionally dragging it yourself overland from one piece of water to another.

No; the Rob Roy is best for what it has been designed for, and the sailing canoe for its purpose, and an intending builder must first know what he wants, and then set about getting those wants fulfilled in the most complete way in the craft he proposes to construct.

The great feature in all sailing canoes is the lateral resistance they offer in some form or another, and without which they could never haul on the wind to advantage. This is obtained in most cases by a centreboard or centreboards, but some racing (sailing) canoes have been designed with a deep fixed keel,

as we shall presently describe. The advantage of a centreboard is that the draught of water can be altered as required, whereas in the case of the fixed keel it remains the same. In the canoes with deep fixed keel, lead can be carried on the keel and they can be designed on the principle of a modern racing yacht, but it is not at all certain that this is an all-round advantage, as the principles involved in sailing yachts and canoes are not the same.

It is an undoubted advantage in a yacht that her ballast shall be mostly on the keel, and so arranged that the greater the angle of heel the greater the righting power becomes. Such a craft, as long as the water can be kept from below—which can be done in a decked craft by closing the hatches—is practically unsinkable, as she cannot capsize—and the knowledge of this is extremely comfortable when pressing a craft in racing. She may careen till her lee-rail and several of her deck planks are under water, but her crew know that unless her lead keel drops off she is as safe as a house. But in a centreboard boat this is not the case. She generally depends on her beam for stability, and, up to a certain point, is safe enough, but there is a point at which she is unsafe and will capsize, and though some people who are fond of risking their lives may like to carry on in such boats, there is always an element of uncertainty and danger, which to most is decidedly unpleasant.

Now, in a canoe her displacement is too small, in proportion to the size and weight of her gear and occupant, to allow of as proportionately good results being obtained by outside ballast as in the yacht. It is found by practical experience on the part of canoe racing men that the alteration of the position of the occupant gives greater proportionate results than the amount of outside ballast suitable for her to carry, and that ballast sufficient to be equivalent to the shifting ballast obtained by the occupant trimming the canoe by the alteration of his position would tend to make a canoe unwieldy for many purposes. Of course, in a racing yacht, however small, the same effect cannot be obtained by shifting the position of the crew.

In diagrams Nos. 1 and 2 you will see that the occupant, having a certain weight, must be taken as an integral part of the canoe, and in calculating her centre of gravity this will entirely depend on the position of the person in her. For instance, if he inclined past A, the centre of gravity would be so altered that the canoe would immediately upset. At A, in a line with the keel and centreboard, he would probably upset, but at C the range of stability would be great, and increasing at every inclination of the occupant to windward in the direction of D. The canoe is kept in the position indicated by the pressure of wind on the sails. The sails and spars in themselves have a certain weight which must not be forgotten; the direction of that weight may be taken from O in a plumb-line. To allow the occupant to shift well out to windward, the side-flaps of the well are hinged, so as to throw back, as at E. In a racing canoe shifting ballast is used as well, which would be stowed somewhere at B. Of course, as the boat was put on the other tack the ballast would have to be shifted over, and the occupant's position must also be altered to the best advantage.

In American racing boats—I allude to the smaller class of open boats—this principle is carried out to a far greater extent. As many "crew" as possible are carried, who simply

act as live ballast, with the exception of the helmsman. On a tack, the "crew" range themselves along the weather gunwale, holding on to a life-line, and leaning out over the gunwale as far as they possibly can. At the same time all the ballast is shifted up to windward. These boats carry an enormous amount of sail, which they could not stand up to for a moment if ballasted in the ordinary way, and the labour involved is excessive when tacking, as in the shortest possible space of time the ballast—no light weight—must be shifted over, and the crew resume their position on what is now the weather gunwale. Hardly a race occurs without one of these craft capsizing, and more generally three or four are upset. They seldom or never sink, as the ballast falls out, and the crew hang on coolly—especially if the water is not particularly warm—until taken off by another boat!

This wretched system of shifting ballast was in vogue over here in the old days of yacht-racing, and the consequence was that the boats of that day were good for nothing else but racing, having neither accommodation nor being good sea boats. This has now been

every puff, and doing so at once, and being equally ready, if the canoe is taken aback, to shift the other way—keeping, in fact, the balance as well as the rider of a bicycle has to, and by practice keeping it, as a good bicyclist will do, almost unconsciously. Then your hands, representing the crew, always ready to pull and haul, to manage the several sheets, to reduce sail instantly if necessary, or to make it again as quickly, and the head, as the captain, guiding, deciding, and taking into consideration all contingencies—not an easy task. And before attempting it, you will do well to get some of the books treating fully on the subject and giving practical directions by men who have found the way "how to do it" by building and sailing not one, but half a dozen canoes; each one carefully thought out, and each an improvement in some way—either form, sail plan, or gear—on the former. Such a book is Dixon Kemp's *Boat-sailing*: with Notes on Canoes by E. B. Tredwen, W. Baden Powell, etc.

Now as to the use of the centreboard. You have most of you seen a barge, have you not? Well, a barge, as you know, is very shallow, and having to make passages along the coast

easily improve her capabilities by making and fitting a couple of leeboards, but I must caution you both as to centreboards and leeboards that if they touch on a bank or bottom the boat will most probably turn over. This may be obviated by applying an india-rubber spring sufficiently strong to take the weight of lee or centreboard so that on touching, the board will rise at the slightest pressure, and fall again when the bank is passed. Off the wind such boats generally steer better with the boards either entirely or partly up—that is to say, when only one board is used. When two are employed, the forward one is raised in running when off the wind, the one aft assisting in keeping the boat running steadily.

We shall presently show a design of a canoe intended entirely for racing; she has, as you will then see, a considerable draft of water aft, and is thus able to do without the after centreboard. Some of the Mersey canoes have no centreboards, and sail well to windward; they have, however, a fixed keel some four inches deep, which affords sufficient lateral resistance. These canoes are very large, perhaps the largest of any class of canoe, and

DIAGRAM 2

DIAGRAM 1

completely altered, and the smallest English racing yacht, well battened down, can make her passages round the coast in perfect safety.

It is this power of trimming the canoe by the disposition of the occupant that enables these craft to carry the enormous amount of canvas they are able to set, combined with the carefully-studied details which enable sail to be reduced in a few seconds. You will see by this that sailing-canoe racing is no easy matter, and it is evident that a man must be an adept and full of resources to succeed in it.

It will be quite sufficient to give you a general idea of the form and peculiarities of these canoes, as before you succeeded in making one you would have to be well up in construction; and not only in that, but would have to understand the principles that govern sailing boats, and the points to be attained, as well as those to be avoided; and then when the canoe was built you would have to find the best way to set a large amount of canvas in such a manner as to be able to reef down at a moment's notice, besides learning by practice how to do this effectively, as well as to keep the balance by the almost intuitive motion of your body while your hands are occupied by gear, and your head by the difficulty of sailing the canoe to the best advantage, taking advantage of every puff, avoiding any obstacle in the way, taking into consideration sets of tide and tricks of opponents. In fact, you would be divided something after this fashion: Your body, as ballast, shifting to

would only be able to sail with a fair wind unless for some contrivance to give her lateral resistance. I am speaking of sailing barges. Now, if you look carefully at a barge you will see two large boards something like fins in the shape of an isosceles triangle on either side of her. These boards are called leeboards, and are used as follows: When the wind is fair the barge hauls up the leeboards and runs on her course with the wind, but if the wind is against her she has to make tacks to windward to reach her destination. It is then that the lee boards are of use. Down they go (you will see they hang by the narrow part or apex on an iron pin or chain to the gunwales of the barge, the lower part of the leeboard, the base of the triangle), then fall below the level of the barge's bottom, and in proportion to the depth and breadth oppose a considerable resistance to the water and prevent leeway (at least the lee one does, the pressure of the water being on it, while the weather one hangs slack, but on the next tack the leeboard that was to weather becomes the acting one, the other being relieved for that tack from duty).

This is the principle of the centreboard, and is used by barges as it takes up no useful room, but leaves the hold intact for stowage. It, however, looks clumsy, and is exposed to the danger of being damaged, though such danger is less in a barge, which is heavily and strongly constructed, than in a small pleasure-boat, and so for these reasons leeboards are not used in such craft, but centreboards are substituted. If, however, you have a boat or canoe that will not go to windward, you can

are really small-decked boats, the well being so long that all the sails can easily be managed from it, and accommodating three persons. Instead of a paddle short sculls are used in iron or brass rowlocks. A Mersey canoe is about seventeen feet long, with four or five feet beam, but does not carry as much sail in proportion as the smaller craft of the Pearl and Nautilus type.

The question of sails and gear is one of great importance in canoeing. I shall only allude *en passant* to the fit-out of racing canoes, as it requires a considerable apprenticeship in cruising canoes before any attempt can be made at racing, and the construction and details of a racing canoe differ as much from an ordinary boat as a racing bicycle does from the ordinary roadster. But in canoe racing the *man* is by far the most important item, and a first-class hand will carry off the prize with a comparatively bad boat against a less skilful canoeist in a far better one. So my advice to you is first to try and build a *safe* canoe, strongly put together, and if with this you can get speed and beauty of form, so much the better, but I do not think you can expect to attain all desirabilities on your first essay. If your canoe is tight, and strong, and stable in the water, that is a success, and is all I should advise you to aim at; afterwards other canoes or boats can be built by you with such improvements as experience suggests, and your increased knowledge enables you to carry out.

I may, however, say that the general aim of all sail plans of racing canoes (and cruising

canoes carrying large sails) is to give the largest amount of canvas that the canoe can carry, with the handiest and smartest method of reducing sail, and this is done by each racing man in a different way, some differing widely in their ideas, their sail plan altogether different, and the other details diametrically opposite to each other; others again only differing in very minor details, as to the use of one block or two or the lead of a rope or halyard. But even these variations show that each canoeist sails his canoe his own way, and rigs her to his own ideas, each endeavouring to improve on the other—in fair and honourable rivalry—and the best man generally wins.

(To be continued.)

F. JACQUES.—The letters D.C. after Washington are the initials of the District of Columbia, in which the United States capital is situated.

EXCELSIOR.—You can get a certificate of your birth from Somerset House by personal application and the payment of a small fee.

YANKEE DOODLE.—Buy a quarterly Navy List, and study the circulars for yourself.

RIGEL.—Applications for employment on the Midland Railway should be made to the head of the department at Derby.

ARTHUR TWIN and CORNELIUS.—The English Carabineers have a blue uniform with white facings. There is only one regiment of them. There are now thirty-one cavalry regiments and seventy-four infantry regiments, besides the Artillery and Engineers. A volunteer is a soldier who serves for no pay, and cannot be sent out of the country on service except at his own request. Each regiment now consists of several battalions; one has no less than twenty battalions.

A. Y. Z.—No one has yet succeeded in "bringing out a perpetual motion," nor is it likely any prize would be offered for what no one would live long enough to prove.

D. A.—Boil twelve ounces of hard yellow soap in three pints of water, and as it boils add a pound of patent driers and ten pounds of boiled linseed oil. This mixture will make your canvas quite waterproof, and keep it flexible.

H. C. J. L.—No. "The Drummer Boy," which appeared in the fifth volume, is now published by Messrs. Sampson Low and Co., price five shillings.

SNIDER.—There are more volunteers in Lancashire than in any county in England. Middlesex comes second on the list. Judging by the number of efficient, Warwickshire is the best county; Oxfordshire perhaps the worst.

WAR.—1. The bookbinder will arrange the parts in proper order and prepare them. He will tear off all unnumbered pages. 2. The cover sold by us takes the volume complete, coloured plates and all. 3. The indexes must be bought separately, but are bound in the yearly volumes.

KLEIN.—1. The way in which the monarch's head is looking is changed with each reign. George I. looks to the right, George II. to the left, George III. to the right, George IV. to the left, William IV. to the right, Victoria to the left. There is no reason why your coin should not be of the reign of George I., as far as we can judge. 2. Foreign words introduced into the English language are pronounced in English fashion as soon as they get out of the long clothes of italics.

J. H. R. L.—Address your letter to the Secretary of the Admiralty, and begin "Sir."

COIN COLLECTOR.—You have mistaken us for somebody else. We never said anything of the sort. George III. half-crowns are excellent things to collect, so are Victoria sovereigns; but we have never yet found any increase in their purchasing power over that of other current coin. Your own sense should have told you that a coin in daily use cannot be worth more than its standard value.

A. D.—We think a cold bath in the morning immediately after rising is decidedly beneficial to most lads.

C. S. F.—The sail used to increase the width of the spanker is a "ringtail." It is very seldom seen in fore-and-aft vessels.

JACK TAR.—The stamp is a Portuguese one. You can get a shilling book on gardening from almost any publisher, but the information will be meagre. The stamps with Helvetia on them are Swiss.

S. B. THE ENQUIRER.—The succession is regulated by Act of Parliament, and in the event of the failure of the present family a fresh Act would have to be passed. There would be no question of "rightful heirship;" it would be a case of election.

A. RIPPON.—1. A barquette is a barque with only fore-and-aft sails on her mainmast. A three-masted schooner has fore-and-aft sails on all her masts; she may carry spinnakers and square topsails, but would not have courses, and would not have topgallant-masts. 2. Above the royals come the skysails, then the skyscrapers, then the moonrakers. 3. For the difference between a topsail-schooner and a brigantine see No. 1. The schooner would never have a foretopgallant-mast.

A. TAKER-IN OF THE "B. O. P."—Owing to our having to print for so long a period beforehand, the reports would be two months old, and perfectly useless. There is a great difference between the arrangements for printing a newspaper and those for printing a magazine.

X. Y. Z.—Consult the Cambridge Calendar, obtainable of Messrs. Deighton, Bell, and Co., of Cambridge, and apply to headquartens.

J. R. S.—When a top is spinning so fast and steadily that it does not seem to move, it is said to sleep. Hence "sleep like a top."

B. R. V.—A "carludovica" is another name for a Panama hat. The hats of that excellent straw were so named in compliment to Carlos Ludovic, or rather Carlos IV., of Spain.

HARRY.—Messrs. Macmillan are Lord Tennyson's publishers. You must apply to them.

H. TAYLOR.—The longest wide jump is 23ft. 1½in., by Mr. J. Lane. A good cricket-ball throw is one hundred yards with the wind against it, but there are no accurate records. Some make one hundred and twenty yards the best.

W. B. H. LANE.—Your method of solving the long-letter puzzle in the April part by ruling it into four and doubling the paper, so as to reduce the length of the letters, is new to us, and certainly clearer than holding the paper obliquely.

E. J. SCAMMELL.—If you order the books from a bookseller he will get them all for you; or, if you wish, he will affix the prices first. It is rather too much to expect us to give here the prices of twenty-seven different books.

F. B. K.—The description is correct, and skins have been successfully cured as stated. See the Museum articles in the third volume for hints on skin dressing.

L. E. P.—An article on the clans, and a plate of the tartans, were in the March part for 1883.

THE SEVEN.—The Seven Sleepers of Ephesus were seven young men who fled to a cave in Mount Calion during the persecution of the Christians under Decius, and there fell asleep. The mouth of the cave was stopped up, but they continued in peaceful slumber for two hundred and thirty or three hundred and nine years, according to which legend you prefer. They then awoke, but lived for only a short time. Their dog Katmir followed them into the grave, but they threw stones at him to drive him away, and even broke three of his legs. The dog, however, refused to move, and at last found speech to say, "I love those who love God. Sleep, masters, and I will keep guard." Which he did until his masters awoke. During their long sleep the youths turned frequently on their sides, and every time they did so some great disaster occurred to the faith. The bones of the sleepers were taken to Marseilles.

E. W. C.—The Patent Office is in Southampton Buildings, Chancery Lane. Apply there for the necessary forms.

SAILOR LADDIE.—The "Ocean Wave" articles were in the second volume, and it costs seven shillings and sixpence.

D. TAYLOR and ALMA.—There is no book on Draughts treating the game more fully than we have done in our articles, which began in No. 33, and ran through the second volume. We have had sixteen articles on the subject.

ARTIST.—Unless there is special talent we would strongly advise another career to be chosen. An apprenticeship is the best way of obtaining an introduction to business. In these days sketches are photographed on to the wood almost as often as they are drawn direct.

H. LACK SZYRMA.—1. We know of no special book on the relations between sound and music, but you will find a good deal on the subject in the works on sound by Tyndall, Chladni, and Helmholtz. 2. None but what is in the calendar, although the registrar will answer inquiries.

F. W. M. MUNRO.—1. The object of the boom on the headsails is to keep them flat. If you can keep your sails flat without the boom you can dispense with it. How you are to do it, however, we fall to see. 2. The topsail halliards are passed through a block in the topmast, but in models a hook on the topsail yard is hooked into an eye or ring about an inch from the truck. 3. No.

ARCHER.—Amsterdam has about three hundred bridges, and so would be the "best bridged city in Europe."

A. COLONIAL (Christchurch, N.Z.).—Yes, but the amount of inferior verse that reaches us is so great that we do not care to say send, but should advise you to seek nearer home for a channel of publication.

B. A. MAN.—Your best plan would be to get "Boat Building for Amateurs" from 170, Strand, price half-a-crown, and study it before you commence. You can get navy canvas from any tent or sail maker. Consult a Glasgow directory.

W. HILL.—1. You must be apprenticed to learn the art properly. The stone comes from Solenhofen, in Bavaria. It is an argillaceous limestone. 2. Put the engraving on a smooth board, cover it thinly with finely powdered salt, squeeze lemon-juice upon the salt till nearly all of it is dissolved; tilt the board till it forms half a right angle, pour on to it boiling water from a kettle until the salt and lemon-juice are all washed away, and then dry the engraving gradually—not before the fire, not by a lamp, and not in the sun. For other ways see back numbers.

A. I.—The fact of it being impossible to answer your letter in time for the wedding relieves us from the necessity of betraying our ignorance in matters so aesthetic. When the bride's dress is deep crimson, and the bridesmaids' deep slate, what should be the colours of the tie, gloves, and flower of the best man? To what a pitch has our art education gone when it thus takes three people to show "a harmony"! The question somehow reminds us of those fashionable plaid trousers immortalised by Leech, of which it took two men to show the pattern.

M. J.—Some of the largest of the Scotch ash-trees are at Logierait, Gray, Ochertyre, and Drummond Castle. That at Logierait is forty feet in girth at a yard from the ground; that at Ochertyre is thirty-five feet at a foot from the ground; that at Drummond Castle is twenty-two feet at a foot from the ground; that at Gray is twenty-five feet at a foot from the ground. There are probably ash-trees even larger than these, but we have met with no trustworthy account of them.

W. A. B.—For permission to fish in the park you must apply to the Ranger.

W. WESTMORELAND.—Get the latest edition of Mr. Thomas Gray's "Going to Sea, or Under the Red Ensign." It is published by Messrs. Kent and Co., Paternoster Row, and obtainable from all book-sellers.

J. S.—There is no breed of fowls that will thrive in a dark, damp place. If you cannot house your pets properly give them away.

BANKER'S CLERK.—Such appointments are only gained through ordinary Civil Service examinations, for which you must watch the advertisements.

FREEZING.—The stuff fixed on wire to imitate rocks is only ordinary Portland or Roman cement.

CLERICUS.—See our numerous articles on Model Yachting; or get the four shilling book published by Norie and Wilson, of the Minorities.

No. 307.—Vol. VII.

SATURDAY, NOVEMBER 29, 1884.

Price One Penny.
[ALL RIGHTS RESERVED.]

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

CHAPTER II.—MOSCOW.

MOSCOW is unknown to most English people. We know something about India, plenty of us have been to France and Germany, but not one in ten thousand has seen more of Russia than photographic views of her churches and towers.

The Kremlin at Moscow was formerly reckoned among the grand productions of human art, and really does not disappoint.

It is the ancient fortress of the Tsars of Muscovy, and contains within its walls some of the most interesting remains of their earlier empire. It is surrounded by a brick wall built quite perpendi-

cular, and surmounted by battlements of a very peculiar form, being cut out in the centre instead of having an unbroken straight line. At regular intervals along the walls small cylindrical towers are built, with curious roofs to them, giving them almost the appearance of pepper-casters of unusual size.

It is a little town within, containing the palace, the armoury, the official residences of the officers of the Imperial household, the courts of justice, some of the most holy churches in Russia, and the celebrated tower of John the Great, at the foot of which stands the king of the bells,

the largest bell in the world—so large that it could not remain in its place, but fell from an immense height, breaking a piece out of its side, which stands near the aperture made by the fall. The monster bell is quite a little house, and the fracture looks like a doorway.

The dome on the top of Ivan Vilike is shaped something like a turban, and as much like a turnip. It is gilt, and is surrounded with inscriptions. The domes of the churches are all either gilt or painted a rich blue with golden stars all over them. But whether gold or blue, they are invariably surmounted by the

"Ivan, losing his balance, fell heavily to the ground."

Russian or Greek cross, which is strongly gilt and hung around with gilt chains. All these bright objects glitter in the sun, and stand out grandly from the pure blue sky.

Besides the churches in the Kremlin there are other sacred buildings. There is a nunnery and monastery, besides the gates, which are all sacred. One of these, the principal gate of the Kremlin, has a holy picture; and it was formerly a law that everybody passing under this picture should take off his hat. There were until within the last few years soldiers to enforce observance of this law, and no excuse on the ground of a man being a foreigner was admitted. Non-compliance with the custom was punished by imprisonment, and in some cases exile to Siberia. The picture, it is said, excited the wrath of the first Napoleon, who heard of its sanctity, and determined to destroy it, but it was singularly preserved from the fury of the French, and remains in its old position to this day over the gate in the clock-tower.

Along one side of the Kremlin flows the Mosk, a river from which the city of Moscow takes its name. The position of the fortress with reference to the river is similar to the relation between the Thames and the Tower, to which latter building—allowing of course for the difference in style of architecture, etc.—the Kremlin in some respects corresponds.

Three days after the fatal evening on which the house at Berozovo was burnt to the ground a man in the dress of a confidential servant to a banker or merchant was seen to enter the Kremlin by the north-eastern gate and proceed to the terrace which overlooks the waters of the Mosk. He was an arteltchik, so called from belonging to the "Artel," a society formed by the better sort of office servants (not clerks) to insure the honesty of its members and to make good any sum of money that may be lost by the neglect of any one of the number. It is similar as a security to the caution-money deposited by such people in England.

The man carried in his hand a small packet, and was evidently waiting for some other person. He was in no particular hurry, for after looking for a moment at the distant "Sparrow Hills," from which Napoleon first beheld Moscow, he turned back, and, approaching one of the churches, took off his cap and bowed low in adoration to the figure of a saint depicted in fresco on the outer wall of the building. He crossed himself many times, and entered the gorgeously decorated church to offer a taper at the shrine of his patron. This done, he left the sacred edifice and continued his walk on the terrace, every now and again glancing at the huge clock in the tower, and then looking in the direction of the new and splendid cathedral of "Our Saviour."

"What a time that fellow is!" exclaimed our devout arteltchik, following up his impatient remark with a series of such explosive expressions as would have shocked anybody not accustomed to the habits to which the lower classes are addicted. "Oh, here he is at last! What do you mean by keeping me here all this time? Where is Ivan?"

"He is with Saschinka, and as well as can be."

"Why did you not bring him with you?"

"Tak!" was the reply, meaning literally "so," but having the force of "Because I didn't." If you ask a Russian how he is, he will answer, "*Tak sibya*"—"So as it may be to me." Ask him how he likes his new clothes, he says "*Tak*," meaning "Oh, they'll do." Ask him whether his son is a good boy, the reply is "*Tak*," meaning "Oh, he might be better." Ask him whether his master has called him a rogue, "*Tak*," equivalent to "Precisely so," is the answer.

"Have you found out anything about the Ozoonovo matter?" continued the arteltchik.

"Look here, Ivan Nekiteroff, I have taken all the trouble in the world, and I can only learn that his mother, or foster-mother, whichever she was, has been dead for some years."

"Then have you no information as to why Mr. Smirnoff took such a wonderful interest in him?"

"I suppose," said the other, "that he wanted some object for his charity, and Ivan was as good as another; but why he calls him Ivan Dobroff I cannot think, and as to his deserving such a surname, I don't see it. He thinks more of fun than of learning. He never sees a Tartar without making a 'pig's ear' with some portion of his dress to insult the Mohammedan by an allusion to the swine. Since he has lived with us we have had no peace for his tricks, and I am anxious to get back to Maziellovo before any mischief happens. I think there is nothing particular about the boy or his case more than usual."

"Perhaps not, but I am naturally suspicious, and Mr. Smirnoff is not the kind of man to do a good action—*tak*!—unless good to himself came out of it. Now, having reasons for being interested in this matter, I propose driving with you to Maziellovo and having a talk with Ivan myself. I have something for him here."

An isvoschek, or hired driver, answering to our cab-driver, was engaged after some haggling and more joking to carry the two friends to Maziellovo, a village about five miles from Moscow.

After the usual amount of bumping and shaking they came at last to the village, rather picturesquely situated, and containing better huts than those described in the last chapter.

The proximity of the place to Moscow causes it to be frequented by the townspeople, who are fond of hiring such huts and living a sort of gipsy life during the summer. This is pleasant enough while the warm weather lasts, but when it becomes either hot or cold it is simply wretched.

It was about twelve o'clock at noon when the two friends arrived at Maziellovo and descended from their vehicle, joking and chaffing with the driver to the last, who, not a whit behind, returned their sallies with interest.

On entering the hut, which had been specially prepared for the reception of visitors, and had by a few rapid touches of the decorator's art been transformed into a *datchie*—i.e., country villa—our two new acquaintances were surprised at seeing the simple arrangements of the sitting-room entirely upset and turned to nought by the active energy of a boy of some eleven years of age, who had pushed all the simple furniture into the adjoining chamber, and, having procured a rope, had contrived to attach it to certain hooks driven into the

wooden walls of the room. He was now balancing himself as well as he could on the extended cord.

With a degree of caution hardly to have been expected from such a "pickle" as this youngster evidently was, he had placed all the beds he could find in the sleeping-room under the cord on the floor to break his fall in case of an accident. He had received one or two falls, but, with a perseverance worthy of a better cause, he had again mounted and was hanging by both hands from the cord, along the whole length of which he contrived to shuffle from end to end.

"What is the boy up to now?" exclaimed our Kremlin friend. "Is he really mad after all?"

Amused at the fears expressed by this person, who took so warm an interest in him, Ivan began to laugh, and thereby losing his balance fell heavily to the ground, but being caught by the mattress no great harm was done. Still, as he tried to raise himself he became sensible of slight pain in the ankle, to which he immediately clapped his hand and exclaimed,

"Oh my! it's sprained!"

"Run," cried the arteltchik, "run, Stefan, and fetch a doctor!"

"Don't want a doctor, it's nothing. I'm going to be a cavalry officer and don't mind pain."

"I don't think there is much the matter with him," said Stefan. "But if you like I will run for Dr. Wolf."

"Look here!" said the boy, "I don't want any doctor at all, and I won't have Wolf, because he's a German, and all good Russians hate Germans!"

"What is that I hear?" exclaimed some one, appearing suddenly upon the scene. "What good men hate is only evil, my dear boy. I have never taught you to hate anybody."

"Mr. Smirnoff!" exclaimed Stefan.

"Who would have expected him?"

"Were you quite alone, Ivan?" asked Smirnoff.

"Yes," said the boy; "I was only playing, and indeed I am not hurt. It was nobody's fault but my own, and I will never do so any more!"

Smirnoff smiled at the boy's eagerness, but he saw that he was in some pain, and thinking the injury might be severe, dispatched Stefan straight to Dr. Wolf, the nearest medical man.

During his absence Smirnoff began to chat with Ivan on the subject of his studies. The boy answered his questions with a docility very unlike the manner in which an English boy would have answered, and during the whole conversation he sat on a wooden bench placed under the window with his foot raised and resting on the bench. But his answers were not very satisfactory. And Smirnoff at length asked him how many hours a day he employed in lessons.

"Oh! that depends; sometimes Mr. Palitzki has less time than others, sometimes more!"

"H'm!" said Smirnoff. Seeing clearly that the boy was shielding his tutor by the vagueness of his replies, he resolved to ask him no more questions on such delicate subjects. Just at this moment the woman of the house, Saschinka, came in and exclaimed violently at the disorder in the cottage.

"What a mess! Oh, Ivan, what a naughty boy you are! When Mr. Palitzki comes home to-night I will tell him to

give you some long lessons to learn before he goes out to-morrow, just to keep you out of mischief! Gruscha! come here, Gruscha!"

"Ah!" said Smirnov. "Mr. Palitzki goes out a good deal then, does he?"

"Oh dear me, yes sir," said the woman, "he seldom comes home before the evening."

"How can you say such a thing?" said Ivan, hoping again to hide Palitzki from Smirnov's wrath. "I am sure he gives me enough to do! If I learn all that I shall soon be fit for the university!"

"I hope you will be fit for the university one of these days, but there is no hurry. It is not necessary for you to pass through the whole course, but I want you to know Latin well."

"And that is just what I hate worse than a German!"

"Ivan, I will not have you speak so violently against any people! You are too young to understand such questions, but we Russians owe much—very much—to the Germans."

"I don't think we owe them anything; they are always well paid for what they do. They take care of that!"

"Who has made you such an anti-German? I am sure you did not learn these notions from me."

"Of course not! You hate nobody—not even the Germans!"

"Glad to hear that, at all events," said a pleasant, powerful voice, as a brisk, good-tempered-looking man entered the room.

"Dr. Wolf, I believe?" said Smirnov, with extreme kindness, as the stranger entered. "Very glad to see you. It was very kind of you to come to see my little adopted son. I don't think there is much the matter with him; still, I have a horror of sprains, and I fancy the ankle is swollen."

"Let me see the injured place, my boy. You are a brave little fellow, anyhow."

"I don't see that," said Ivan. "There is nothing the matter with me unless you bite me!"

"I bite you! What do you mean?"

"Wolves bite, and I am afraid of wolves. Am I a brave little fellow now?"

"You are an impudent little fellow, at all events. But let us see the injured part."

The doctor turned up the white canvas trouser of the boy, and then made the usual "passes" with his hand round the limb, which, after a due amount of punching, pinching, and pushing, he declared to be quite uninjured, greatly to the satisfaction of Mr. Smirnov.

"You have nothing to be afraid of now, my boy," said the doctor. "Run off as if I or my namesake were at your heels."

There had been a kindness and a tenderness in the tones of this "German" that had gone straight to the heart of little Ivan. He looked up in the doctor's face, and with his peculiarly sweet smile said, "Thank you, doctor. I hope you will forgive my rudeness, but I did not think you would have been so kind. May I go now?"

"Good-bye, my boy. Run away and enjoy yourself in the sunshine, but take care not to get too much of it."

Away sprang Ivan, glad to find that the "crick" which his ankle had made when he fell was no sign of fracture, and

that the swelling was due only to the imagination of his adopted father.

"Has the boy no mother?"

"Neither mother nor father."

"The father's place you can supply, but no one on earth can be a mother to a motherless boy. There is great gentleness with all his odd, half-savage ways. Pity there is not a kind, motherly woman to look after him."

"Yes, I think so. He boarded, however, in the family of a priest, whose wife exerted a very good influence upon him."

"That is hardly enough. The woman to whom he is confided ought to be a lady; she, I fancy, is not."

"You are right, doctor; I will see about it. I am most dissatisfied with a young student to whose care I have confided him, and this person—I have only to-day discovered the fact—is in league with a party of Nihilists! Just in time I discovered, through a servant, certain papers which had been left by Palitzki in a drawer by mistake. The man could read, and after looking through them thought it his duty to bring these papers to me, and I have come to Mazielovo on purpose to expose and dismiss this young man."

"There is metal in that boy, Mr. Smirnov; look at him yonder!"

Smirnov looked out, and beheld, not far from the house, little Ivan with a long stick, which he was managing after the fashion of the Cossacks, who are very expert with the lance. He had engaged about a dozen of the peasant children to join him, and had armed them with similar sticks. He was now marching them, with their toy lances sloped over their shoulders, to the sound of their own voices, as the Cossacks are marched to the same vocal music. The Russians have a remarkable gift as regards song. The service of their church is almost entirely song, and the boys are accustomed to it from a very early period.

The charm of this childish music was very great; and Smirnov, begging the doctor to excuse him for a moment, left the house to hear them better, as they marched round from the street towards some common land at the rear, while the doctor, who seemed to have taken a wonderful amount of interest in our hero, commenced the following conversation with Stefan.

"Fine little chap that!"

"Yes, doctor, the saints be praised! He is not a bad boy—awful wild, though!"

"He seems to me very affectionate and gentle in his way."

"He is all that, especially with Metrofan Dmitrievitch. But he can be wild when he likes. Oh, dreadful! Wants to be a soldier! He is quite another boy alone."

"I suppose Mr. Smirnov does not like these soldiering tastes?"

"Who? Oh, Smirnov! Oh, no, he doesn't believe in soldiers, you know. He is a merchant."

"But many sons of merchants become officers nowadays, especially as everybody has to serve."

"That is true; but Mr. Smirnov is educating him to be his heir. So he goes to the Gymnasium, and learns Greek and geography. He will be a *barin* (gentleman) himself in time, and have his own estate and servants, and goodness knows what fine things! Yes, such is God's will!"

"Strange! But, tell me, whose son is he?"

"That I do not rightly know, but his father was a soldier, and was killed by the English."

"Nonsense! If his father had been killed in the war against the English in the Crimea, the boy must be nearly thirty years old now! Don't you know the war with the English was in 1854?"

"I don't know when it was, but I remember only some four or five years ago, when Skobelev was fighting the English at Plevna—"

"Skobelev never fought the English; you are thinking of the Turks."

"Well, of course you must know best; but I thought that was all the same—they are all pagans. It is all the same thing."

"Never mind whether they are pagans or good Christians; was it at Plevna that this boy's father was killed?"

"They say so, and his mother died long before; so Ivan was put out to nurse, but I suppose there was no money, and the nurse died about two years ago, and so Metrofan Dmitrievitch heard of the boy, and now he has adopted him. Why I cannot tell."

The conversation was here interrupted by the entrance of a tall and not very cleanly young man, who entered the room hurriedly, exclaiming "Ivan! Ivan!" He started on seeing the doctor, and said,

"Hullo! what's the row now? Ivan ill?"

"Is your name Sergius Nicolaevitch Palitzki?"

"It is. Why do you ask?"

"I wanted to know whether you were the student to whose care the boy was confided?"

"And if I am, is that any business of yours?"

"Decidedly," said Wolf, waxing warm; "the boy might have had a serious accident through your neglect."

"My neglect! What do you mean! I gave him the First Declension to learn; if he had done his duty *you* would not have been here!"

"Perhaps not; but you cannot expect the boy to love his duty when he sees you neglect yours."

"Who says I neglect mine?"

"It is well known," said Wolf, at a venture, "that you habitually neglect the child."

"I have not engaged myself as a nursemaid, and I am not answerable to any person here, especially not to a *German*—this in a tone of great contempt—for any of my actions, and I do not neglect my duty."

"Oh, yes, you do, though," said Smirnov, appearing as he spoke, and addressing Palitzki in a quiet, firm undertone. His appearance was so unexpected by the student that his surprise and fright partook somewhat of the comic element.

"Sir," said the student, "this is a fresh insult! What that German doctor said I can set down to the score of his ill-will at losing a patient. But what you say, as the guardian and protector of this child, is another and more serious matter."

"Oh, yes," observed Smirnov, in the same quiet, calm, and resolute manner; "you are quite right there. The one is only a medical opinion, although a valuable one; the other may be connected with serious consequences, Sergius Nicolaevitch Palitzki!"

At this the young man assumed a

very blustering air and commenced talking in a high key, but Smirnoff produced a small leathern case from an inner breast-pocket. This he opened, and selecting a paper from several documents therein contained, opened it, and held it out so that Palitzki could see the signature, and then, withdrawing it rapidly as that worthy made a sudden grab at it, as if to tear it away, said, without any change in his voice or demeanour:

"That is your handwriting, nor would it be of the slightest use to deny it. You are known, and must trust to my mercy and forbearance; it is quite ridiculous to attempt the heroics when I hold *this*!"

Palitzki said not a word, but turned away and entered the sleeping-room which he occupied in common with Ivan Dobroff. Meanwhile, Smirnoff turned to the doctor, and said, in a sweet and engaging voice,

"My dear sir, I am quite ashamed of myself to think of your being witness to a scene like this, and still more ashamed to think that you have been standing all this time. Pray take a seat, and allow me to express my obligation to you for your care of my boy, who I am sure will not forget it. I most particularly desire that if your other occupations will permit you should give us the benefit of your advice and valuable aid as our regular household medical friend."

"You are very good, and I am flattered by this mark of your confidence, but for the moment you must not think me churlish if I run away. I neglected an important case, which I should have attended an hour ago, but was called in to your interesting young *protégé* there."

"My dear doctor, if your time is so short, pray take my horses and droshky. They are fresh, and will carry you over the ground in no time!"

"Thanks! but my little nag with the tarantass will serve my turn. I am only going over to Daviedovo!"

"As you please; but you said you had neglected a dangerous case to come to my family, and I thought that my horses would help to make up for lost time!"

"Well, there is a great deal in that, so I will accept your offer, and perhaps through the freshness and better condition of your cattle I may be in time."

The two men left the house together to compare notes about their horses. There was not much room for any great diversity of opinion there. The droshky of the wealthy Moscow merchant was a curious structure on four small wheels, with a seat for one person in the body of the vehicle, which was as lightly built as possible and painted black. The horses were two beautiful black steeds in splendid condition, one harnessed to the shafts and having the universal Russian *duga* over his head, while the other was attached by a yoke and traces to the side. The driver was a stout, burly, good-humoured Russian, with carefully cut beard and hair, just a little of a white neckcloth to be seen above the collar of his long gown-like blue cloth coat, and he wore on his head a very smart low-crowned black beaver hat very curly in the sides, with very small brim and very wide top. Round the waist of this portly figure was bound a deep-red scarf, and he held in the horses with both hands. The tarantass of the doctor was like nothing else but another tarantass, so I

must try to make my young readers understand as well as I can by description.

The tarantass is a light frame on four wheels, on which some half-dozen very elastic wooden bars are placed parallel with the length of the machine. These are the *springs*. Upon them is fixed a semi-cylindrical contrivance made by bending a number of pieces of wood into the shape of half hoops; these are connected by longitudinal bars of wood, and the whole is covered with thick bark of trees. By this means a sort of basket is formed of a semi-cylindrical shape. The two ends are closed with bark and pieces of wood, and then this basket, boat, or cradle is fixed upon the elastic poles which do duty as springs. The axle-trees are very long, so long as to admit, in some cases, of shafts being fitted inside and also outside the wheel, each shaft forming a sort of fork in which the wheel plays. The vehicle owned by our friend the doctor was not so cumbrous, inasmuch as the shafts were simple like the ordinary shafts in general use. A board was strapped across this queer machine, adding much to its nautical look, giving the observer the impression that it was some odd kind of boat on wheels.

"Good morning, Dr. Wolf!" cried the driver of the dandy droshky to the doctor. "I hope you are quite well. Glory be to God, I am all right since you cured me that time at Tula. You remember?"

"I remember now," said the doctor. "Awful scamp he is too"—this in a whisper to Smirnoff, who nodded appreciatively, and said, with all the pride of ownership, "The biggest scamp in Moscow! I am very proud of him."

"Well, I want you to take the doctor across to Daviedovo. If you do it in a quarter of an hour I shall let you off that ten roubles for the wheel you smashed in your carelessness last Saturday."

Here the driver's face glowed with humour. "All right, barin!" he said; "you would never stop a trifle like that out of a poor man's wages—a gentleman like you, too! I know you better, and I thank you beforehand for the nice new crisp ten-rouble note you are going to give me if I'm back within the half-hour."

Both Wolf and Smirnoff laughed, and the latter said, "I don't want you back until Dr. Wolf wishes to return, only he must be in Daviedovo in fifteen minutes. Never mind me, doctor, I can take your tarantass to Moscow, from thence your man can drive back to Maziellovo in your vehicle. It's all right; jump up, and allow me to hand you this for your visit to-day. We have not commenced our annual regular arrangement yet, so this must be considered as an ordinary visit. Good-bye."

"You make everybody do what you like," said the doctor. "I cannot resist you; but you may depend on my doing my best for the boy."

"All right, doctor?"

"All right! Pasholl!"

This was to the driver, and meant, "Be off with you!"

And they were off! Away they darted up the broad, uneven road, then they turned down a branch path near the smaller houses. Away they went. Smirnoff stood gazing, so did the arteltchik,

so did Stefan, so did Saschinka, so did Gruscha.

At last they turned to enter the house, which Gruscha was the first to do. She uttered a cry of surprise. Smirnoff, attracted by the sound, rushed into the datché, thinking that something had happened to Ivan Dobroff. But who can paint his consternation on finding that Palitzki had fled? The window was open, the small drawer in the chest which contained his linen and one change of raiment was empty. The little hand-valise which he boasted could contain his all was gone also. And what else? Why, the little boy! Ivan Dobroff had vanished too!

(To be continued.)

THE STAR OF THE SOUTH.

BY JULES VERNE.

CHAPTER VII.—THE LANDSLIP.

A FORTNIGHT passed, and Cyprien found not a single diamond. More and more did he become disgusted with his trade. It seemed to him, without capital enough to buy a first-class claim and pay a dozen Kaffirs to work it properly, but little better than a swindle.

One morning, while Matak and Bardik went out with Steel to work, he stayed in his tent to answer a letter from Pharamond Barthes, which had been brought in by an ivory trader.

Barthes was enchanted with his life of hunting and adventure. He had already killed three lions, sixteen elephants, and an incalculable number of giraffes, antelopes, and such small game.

"Like the conquerors of history," he said, "we make war feed on war. It frequently happens that we not only feed the whole expedition on what we bag, but also make considerable profit by selling or bartering the skins and ivory." And in conclusion he said, "Why don't you come with me and have a turn on the Limpopo? I shall be there about the end of next month, and intend to go down to Delagoa Bay, to return by sea to Durban, whither I have promised to take my Basutos. Leave your horrible Griqualand for a few weeks and join me."

Cyprien was reading the letter over again when a tremendous noise, followed by a loud shouting in the camp, made him rush out of his tent.

An excited crowd were running towards the diggings.

"A landslip!" was the cry from all sides.

The night had been very cold, while the preceding day had been one of the hottest for some time. This sudden change of temperature had, as usual, caused the earth to crack and break away.

Cyprien hurried to the kopje. A glance showed him what had happened.

An enormous block of earth, about sixty yards high and two hundred long, had been cleft vertically, and a fissure formed in it like a breach in a rampart. Thousands of tons of gravel had been detached from the main mass and rolled down into the claims, filling them with sand, pebbles, and rubbish. Everything on the spot at the time—men, oxen, and

carts—had been hurled below. Fortunately the majority of the diggers had not yet gone down to work, so that but a very few were buried by the fall.

Cyprien's first thought was for Steel, and soon he had the pleasure of recognising him amongst the men near the cleft. He ran up to ask him how it had happened.

"We are all right," said the Lancashire man, as he shook hands.

"Where's Matakiki?" asked Cyprien.

"He is down under there," answered Steel, pointing to the rubbish which was heaped up on their claim. "I was waiting here till he had filled his first bucket when the slip took place."

"But we cannot leave him there without trying to rescue him. Perhaps he is still alive."

Steel shook his head. "It is not likely that he can be living under fifteen or twenty tons of earth. Besides, it would take ten men two or three days to clear all that off."

"Never mind," answered the engineer; "it shall not be said that we left a fellow-creature down in that grave without trying to get him out."

And then, through Bardik, who was standing near, he offered to the Kaffirs the high pay of five shillings a day to all who would help to clear out the claim.

Thirty negroes undertook the job, and without losing an instant set to work. Picks and shovels were there, buckets and ropes were ready, and the carts were standing by. A great number of the whites, hearing that they were trying to dig out a poor fellow buried alive by the landslip, volunteered their help, and Steel, thoroughly roused by Cyprien's energy, was by no means the least active amongst them.

By noon several tons of gravel had

been cleared away. At three o'clock Bardik uttered a hoarse cry. Beneath his pickaxe he had just caught sight of a

black head. The men worked with a will, and a few minutes later Matakiki's body was exhumed. The unhappy man

"The unhappy man was lying on his back."

"Men, oxen, and carts had been hurled below."

was lying on his back, motionless, and to all appearance dead. By a singular chance one of the leather buckets had been turned over on his face and covered it like a mask.

This Cyprien noticed at once, and it led him to think that he might recall the poor fellow to life. The hope, however, was very feeble, for the heart beat no longer, the skin was cold, the limbs had stiffened, the hands were clenched in agony, and the face—of that livid paleness peculiar to the negroes—was frightfully contracted by asphyxia.

Cyprien did not lose courage. He had Matakiki carried to Steel's hut, which was nearer than his own, and here he was laid on the table where the gravel was usually tried over. Systematic rubbing was then begun, particularly that chafing the thoracic cage, with a view to establish artificial respiration, which is employed in the case of the apparently drowned. Cyprien knew that this treatment was equally applicable to all kinds of asphyxia, and in the present instance he had nothing else to attend to, as no wound or fracture, or even serious bruise, was apparent.

"Look!" said Steel, who was rubbing away assiduously; "he is holding something in his hand!"

The result of these measures soon became apparent. The corpse-like stiffness of the young Kaffir gradually relaxed; the temperature of the skin sensibly changed. Cyprien, who was watching the heart for the least sign of life, thought he could feel a gentle trembling that augured well.

Soon the symptoms became more marked. The pulse began to beat, a slight inspiration seemed to insensibly inflate Matak's chest, and then a stronger expiration betrayed a manifest return of the vital functions.

Suddenly two vigorous sneezes shook

telligence, obedience, and ardour in his work were astonishing. He was fearless and obliging, and of a singularly quiet and cheerful disposition. He had, however, one fault—a very serious one—due evidently to his earlier education, and to the Spartan customs that prevailed in

the best he could of this fortunate circumstance by breathing only at long intervals. But little by little the air became foul. Matak found his senses gradually going, and fell off into a deep, painless sleep, whence he roused for a moment now and then to make a determined attempt at inspiration. Then all was a blank.

Cyprien let him talk for a minute or two, and then got him to drink and eat, and compelled him, in spite of his protests, to remain in bed for the night. Then, feeling sure that all danger was over, he left him alone, and went to pay his customary visit to Watkins Farm.

He wished to tell Alice what he thought of the events of the day, and of the dislike he had taken to the mine—a dislike which the deplorable accident of the morning could not but increase. He told her of his disappointments and vexations, and of the letter he had received from Pharamond Barthes. Would it not be better for him to take his friend's advice? What would he lose by going to the Limpopo and trying his luck as a hunter? Surely it would be a nobler occupation than that of sifting the ground like a miser, or getting other people to sift it for him.

"What do you think, Miss Watkins?" he asked. "You have so much practical good sense, advise me. I have lost my moral equilibrium; I want a friendly hand to set me right again."

Thus spoke he in all sincerity, pleased, he knew not why, at thus betraying his indecision to his gentle confidant, who listened with deep sympathy.

"I have long thought the same of you," she answered. "I cannot understand how a scientific man like you can abandon yourself to such a life. Is it not a crime against yourself and against science itself? To give your precious time to mere hand labour, such as a Kafir or a Hottentot could do much better, seems to me to waste it."

Cyprien had only one explanation to give of the problem which so greatly astonished and shocked the young lady. Perhaps she was exaggerating her indignation a little to force him to an avowal? But that avowal he had promised not to make, and so he restrained himself, although it trembled on his lips.

Miss Watkins continued, "If you want to find diamonds so badly, why don't you look where you are most likely to find them—in your crucible? What! you a chemist, knowing more than anybody what these wretched stones are which people value so highly, and set yourself to mere mechanical labour? If I were in your place I should try to make diamonds, not to find them!"

Unfortunately at this moment Watkins awoke from his sleep to ask the latest news from Vandergaart Kopje, but the seed had been thrown on good ground, and was sure to germinate.

As the young engineer returned home he pondered over Miss Watkins's thrilling words. All that was fanciful about them disappeared when he thought of the generous and almost tender confidence that they showed in him.

"And why not?" he asked himself. "The fabrication of the diamond may have appeared Utopian a century ago, but now it is as good as done. Frémy and Peil have made rubies, emeralds, and sapphires which are only differently coloured crystals of alumina. MacTear

"I should try to make diamonds."

the black carcass from head to foot. Matak opened his eyes, breathed, recovered his consciousness.

"Hurrah! hurrah! he's all right!" exclaimed Thomas Steel, as, dripping with perspiration, he suspended his rubbing. "But look! he has never left go of that piece of earth in his hand!"

Cyprien had other things to think of than such a trifle as that! He made his patient swallow a spoonful of spirits, and then raised him so as to facilitate his breathing. Finally, when he found he had really returned to life, he wrapped him up in blankets, and, with the help of three or four willing companions, carried him to his own hut at Watkins Farm.

There the poor Kafir was put to bed, and Bardik made him take a mug of hot tea. In a quarter of an hour he peacefully fell asleep. He was saved!

Cyprien felt that incomparable gladness in his heart which a man experiences when he has snatched a human life from the jaws of death; and, sitting down by Matak, took up a book, interrupting his reading from time to time to look at him as he slept—like a father watching the sleep of a convalescent son.

During the six weeks Matak had been in his service Cyprien had had every reason to be satisfied with him. His in-

his father's kraal. Matak was just a little of a thief, but almost unconsciously so. When he saw anything he liked he thought it the most natural thing in the world to annex it.

In vain his master, alarmed at the tendency, talked to him and argued with him. In vain he had threatened to send him away if he found him out in another attempt. Matak promised never to do so again, cried, begged pardon, and the very next day stole something else, as if nothing at all had happened.

His larcenies were not heavy, however. His covetousness was not excited by things of great value; a knife, a cravat, a pencil, or some such trifle would be enough for him. But Cyprien was none the less broken-hearted at finding such a failing in so sympathetic a nature.

"Wait! hope!" he said. "Perhaps I shall some day make him understand how wicked it is."

Towards nightfall Matak awoke, as well as if nothing had happened, and then he told his story.

The bucket that had accidentally covered his face, and a long ladder serving as a buttress above him, had kept off the pressure, and saved him for some time from complete asphyxia by leaving him a little air to breathe. He had made

and Hannay, of Glasgow, really made diamonds, and their only fault was that they were so horribly dear—dearer than the natural diamonds of Brazil and Griqualand—and consequently the discovery was of no commercial value. But when the scientific solution of a problem has been arrived at, the industrial solution is not far off. Why should I not seek for it? The men who have failed hitherto have been mere theorists—men of the study and the laboratory. They

have not studied the diamond in position—in its native earth—in its cradle, so to speak. I have the benefit of their work—of their experience—in addition to my own. I have extracted the diamond with my own hands. I have analysed it, studied it under every aspect in which it has been found. If anybody had a good chance of succeeding, I am the man—at least, I ought to be the man.”

Thus thought Cyprien, as, turning the matter over in his mind, he lay

awake during the greater part of the night.

His resolution was soon taken. On the following morning he told Steel that he did not intend to work his claim any more, and arranged with him to retire from the partnership as soon as some one could be found to take his place. Then he went back and shut himself up in his laboratory to think over his new scheme.

(To be continued.)

SCHOOL AND THE WORLD.

CHAPTER XIII.

“GARLAND,” said Ferguson the same evening, after tea, “can you come into our room during preparation? I want to talk to you.”

“All right, I will manage it.”

“Come in without letting everybody see you. It’s an unpleasant business I want to consult you about.”

Garland wondered what it was, but restrained his curiosity for the present.

He obtained permission to leave the big room half an hour earlier than usual. Ferguson was waiting for him.

“Would you like to be treasurer of the football this season?” he asked.

“No, thanks. Why? Are you going to resign?”

“Yes; there isn’t enough money to make it worth while to have a treasurer that I can see.”

“What do you mean?”

“I mean that some one has been paying a visit to my desk, and relieved the club of its superfluous cash. We shall have to get along with our old balls this year.”

Garland seemed thunderstruck.

“Who has done it?” he asked.

“You don’t suppose I know, do you? Keep calm, my dear boy.”

But Garland was unable to do so.

“Have you told the Doctor?”

“No, and I don’t want to till I have something more to tell him than I have now. I want to find where it is first, and then it’s the Doctor’s business to make the fellow who has got it disgorge.”

“You think it’s some one in the school?”

“There are a hundred and fifteen boys, and only about a dozen servants, so the odds are in favour of its being a boy.”

“But who do you suspect?”

“Now we’re coming to the point. You’re a safe chap, that’s why I’m telling you about it. The first point is, where is Melhuish?”

“He wasn’t in to tea, but he may have got leave to stay out.”

“No, he hasn’t; I found that out. I believe he’s gone—run away.”

“What for?” asked Garland, incredulously. “He’s been very queer lately, but I thought that was because he wasn’t well.”

“I don’t know why he’s gone, but you may be sure he has. You’ll find he won’t turn up at prayers, then they’ll find out about it. The point is this. On the face of it Melhuish has taken this money to run away with; but, on the other hand, suppose some one else knew he was going to run away, and so took the opportunity of helping himself, taking it for granted that the blame would fall on Melhuish?”

“That doesn’t seem probable.”

“No, but a lot of unexpected things happen. I’m inclined to suspect Melhuish, but I don’t mean to jump to conclusions too soon.”

“How can you prove anything?”

“I’ve several ideas. First, I’ve found out who were in here after I left the room about five minutes to five, when my desk was all right. Next, the gold I had in that bag was marked. You see, I didn’t like that business about Simpson’s money at the beginning of the half; it was never cleared up; so I resolved I’d keep an eye on the cash in my charge. We can find out if Melhuish paid for his ticket in gold or silver. I’m going down to-night about it. I can get the Doctor to let me out; in fact, he will be sure to send me, when he finds Melhuish is gone, to discover where he took his ticket for. If he doesn’t send me he’ll send you. Then both of us must keep a sharp lookout for any gold that is knocking about; if any youngster seems spending an unusual amount he must be watched.”

“I don’t half like this,” said Garland.

“My dear fellow, you don’t suppose it’s a pleasant job for me, but I don’t mean to stand the loss of three pounds ten without making an effort to get it back.”

The prayer-bell rang, and they went back to the big room. The Doctor stalked in with his book and mounted the desk. Names were read out; that of Melhuish received no response.

Prayers were proceeded with as usual, though not a few were wondering what had become of him. When the Doctor descended from his desk, he asked Mr. Pickering where Melhuish was. Mr. Pickering was unable to inform him.

“Come with me a moment,” said the Doctor. Excitement now took possession of the school; it reached fever height when Garland was sent for. He was to go to the station to make inquiries. Old John was interrogated, and stated that he had seen Mr. Melhuish go out “close upon five o’clock.”

As Ferguson told Garland, he had found out who were in the room after he left. Both Soady and Lang had visited it. Soady it was impossible to suspect; he was always in ample funds. Suspicion lay between Lang and Melhuish, with a great preponderance against the latter.

There was nothing to show how the desk had been opened, for Melhuish had taken the chisel with him, dropping it out of the carriage window when some ten miles from St. Mary’s.

Ferguson determined to keep the affair of the desk to himself for a time at least; he would see what he could find out before he spoke of it. Perhaps it would be as well to see Lang.

The first form crowded into their room at the close of prayers; they were allowed to sit up an hour later than the others. The one subject of conversation was Melhuish’s flight.

Ferguson did not take much part in the conversation, but pretended to busy himself with his accounts. Soon he looked up, and said quietly to Lang, who was standing near, “I say, Lang, you can’t give me a half-sov. for some silver, I suppose? These subscriptions load up one’s desk tremendously!”

“Yes, I can do it for you.”

He gave Ferguson the half-sovereign he had received from Melhuish, which the treasurer pocketed. When Lang had turned away he examined it carefully.

It was a marked coin; there was a minute dot just behind the Queen’s head.

Ferguson scarcely knew what to think. At this moment Garland came back; he had seen the booking-clerk, who remembered distinctly giving a ticket to Melhuish, who had paid for it in silver. There was no silver gone from the football money; the evidence, so far as it was of any value, seemed to point away from the runaway.

“What are you going to do?” whispered Garland.

“Tell the Doctor; I can’t get any further by myself. I’ve found out where some of the money is, at any rate.”

“Who has it?”

“Lang.”

“Shall you tell the Doctor that?”

“Yes, I shall. I don’t want to get any fellow into a row, but I don’t mean to lie under suspicion of being a treasurer who does not look after his treasure. It’s for Lang to clear himself; I dare say he will be able to. I suspect Melhuish.”

That same night, before going to bed, Ferguson saw the Doctor, and told his story. Dr. Fellowes looked very grave.

“The inference certainly is that Melhuish is the guilty party,” he said. “But we must not be too hasty. Don’t say a word of this affair to any of the boys, it is best kept quiet. I will see Lang myself. Send him to me.”

Ferguson put a bold face on it, and delivered his message just as he was going upstairs.

“What’s he want?” asked Lang.

But Ferguson pretended not to hear. Lang went in, puzzled as to the cause of the summons, but taking it for granted it was for something disagreeable, for he knew he had been getting more and more behind in his examination work, out of sheer despair of getting through.

Dr. Fellowes, though a good scholar and upright man, was not in all respects

"Delivered his message just as he was going upstairs."

an ideal schoolmaster. He was of a suspicious turn of mind, and he was of an unsympathetic nature. Now that Lang was once more under his suspicion his mind at once travelled back to the time when Simpson lost his money, and it was discovered that Lang was the only boy in the Rummage-room during the time the theft took place. Moreover, Lang had denied that he was there—or at least had not confessed he was when asked.

"Lang, do you recollect the last occasion when I had to send for you?"

"Yes, sir."

He remembered it only too well.

"It is a very serious thing that on this occasion the subject is of the same nature."

Lang looked up quickly.

"There has been some more money taken; this time under circumstances that leave no doubt as to its being a theft. But the money stolen was marked by the owner, and now I want you to account for the fact that part of it has been traced to you."

"To me, sir? I haven't heard a word about it!"

"Possibly not. I don't accuse you, I only want to know how you obtained the half-sovereign which you gave Ferguson."

"Melhuish gave it me, sir, this afternoon, just before he ran away."

"Ah, yes! I've not much doubt that is the fact. I wish I could say I was quite sure of it; but you must remember you

deceived me once, and now you are reaping the consequences. Were you on good terms with Melhuish?"

"We had a little quarrel the day before yesterday, sir, but we made it up in a sort of way."

"H'm! Is that half-sovereign all the money he gave you?"

"He didn't give it me; I gave him ten shillings for it."

Lang spoke almost insolently; the calm, hard way in which the Doctor spoke of the whole affair was infinitely annoying to him. He was as innocent as Garland, and yet the Doctor seemed to think it was quite an even chance whether he were a thief or not.

"Do you think I took it?" asked Lang, imperatively.

"No; I won't go so far as that," replied the Doctor; "but if you will look at the matter calmly you will see that my hesitation is not altogether unwarranted. Yet I have no right to accuse you on such slender evidence, and I have no wish to be unjust. Unless you mention this matter yourself no one else will; you will be quite unsuspected unless you bring it on yourself."

Lang went to bed. For half an hour he had a great mind to follow Melhuish's example and run away from a school where he was treated so unjustly. Twice had he come under suspicion of a crime which he had never committed. His

father would never let him stay under a master like Fellowes if he knew the truth.

He refused to speak to Ferguson, who on his side did not like to take the first step. Lang was ignorant that Garland knew anything about it, and the latter had asked Ferguson to keep his name out of the affair. Garland believed Lang innocent and Melhuish guilty; indeed, who would not have done so? More than that, Garland determined to show Lang more than usual kindness, and then let him know he was aware of the whole affair; that would be a proof of his belief in his innocence.

The Doctor, though somewhat harsh in his treatment of Lang, behaved generously as regards the loss the football club had sustained. In order to keep the theft unknown, and so maintain the character of the school, he himself gave Ferguson the three pounds ten that had been abstracted, so that the new balls were bought after all.

(To be continued.)

Jock o' the Mill.—See p. 133.

JOCK O' THE MILL.

A TALE OF THE BORDER.

As every one knows, it was not so many centuries ago that the borderland between England and Scotland was considered fair hunting-ground for those who lived within reasonable distance of the Tweed. It was claimed by various lords who probably had small right to it, but who tried to enforce their rights with little regard to the justice of their claims.

After Chevy Chase the ill-feeling between the border clans became still more bitter, and involved the unhappy people who lived in the neighbourhood in still greater misery than before. The raids of the English were revenged by the Scots, and *vice versa*, and numberless petty encounters took place of which neither history nor ballad takes any note.

The Baron of Melton was one of the chief raiders. In fact, in spite of his title, he was no better than a common robber. His misdeeds were connived at by the English Government because he was useful in checking the advance of the Scots, of whose inroads into England there was a constant dread. So the baron was permitted to enrich himself as well as he could from the plunder of his neighbours.

There was, however, a thorn in the baron's side. Jock o' the Mill was a man of no account socially speaking. He had been a plain miller till his mill had been plundered and his cattle driven off by the baron. He had been molested several times before, but had managed to carry on his business in spite of it. That last attack, however, convinced him that it was useless to try and continue his peaceable trade whilst such men as the baron were within a short night's ride.

So he gave up his grinding and turned his mill into the nearest approach to a fortress that he could contrive. The situation greatly favoured him. By building a barricade across a narrow path which ran along the side of the precipitous rocky bank of the river which fed his mill he was able to render it impregnable on one side. By raising the dam of his mill-stream he was able to flood the marshy ground around him, so that on the whole he was well defended. Add to this that the approaches to the mill, with the exception of the barricaded path, were through a tangled glen of which scarcely any one knew the secrets.

It was not long before Jock had a following of nearly a score men who had suffered from the incursions of the English and were eager for revenge. They made occasional expeditions on their own account as they grew stronger, and soon became known through the country-side. They made no attempt to attack the large castles and strongholds of the English, but confined themselves to exploits which were not hazardous.

Jock's chief desire was to revenge himself on the baron, yet he durst not attack him openly. But every now and then a shower of arrows would drop into the castle when least expected, wounding or perhaps killing a man or two, and the baron guessed rightly that Jock was at

the bottom of it, though no trace of any one could be found. More than once the baron's march home had been annoyed and impeded by sudden and rapid attacks, the enemy disappearing almost before they were seen.

All this was very annoying to the baron, who was a powerful lord, able to muster a hundred men-at-arms at need. He determined to rout out Jock and set his mill on fire, disposing of him once for all. So with fifty men he marched to the mill one dark night.

That was the most disastrous expedition he had ever made. He was ignorant of the existence of the barricade, so went steadily forward until it was reached. Then trouble ensued. The hinder riders pressed on those in front; one horse went over the precipice, not without noise; Jock's sentinels were aware of something going on and hastened to give the alarm. The attacking party soon found boulders rolling down on their heads; the confusion became still worse. By the time they regained a place of safety their numbers were reduced by nearly a third.

It can easily be imagined that the baron did not intend to sit down idle under this rebuff. He vowed the most terrific revenge. But he was wise enough to see he must be more cautious next time. Jock was not an enemy to be despised.

So the baron dispatched some spies, who were to discover the way down the glen so as to avoid the path along the hillside. But the spies were singularly unsuccessful in their search. The fact was that the first had been caught and killed on the spot, and the rest saw that to venture into the glen was certain death, for Jock was now on the alert.

But the baron, suspecting that cowardice was at the bottom of their reports, gave the last-comer, a hind named Pierce, a taste of his heavy hand and sent him out again, vowing to hang him if he came back without certain news of the approaches to the mill.

It was a week before he returned. The baron had almost given him up.

"Have you succeeded?" asked his lord, imperiously.

"I have penetrated even to the mill itself. I know every approach," replied Pierce, humbly.

"Good for you you do," said the baron, "or your bones would soon be whitening! Lead the way to-night, and tell the men-at-arms to prepare. There is room for horses?"

"In single file through the glen, but there is open space enough close to the mill."

"That will do," said the baron.

When night fell the little army sallied forth. Pierce rode in front to lead the way, promoted for the time to the dignity of a horse. The baron followed with his company, leaving those on foot to make the best of their way in the rear. He knew the ground would soon be so difficult that they would overtake the horsemen.

The journey was made without mishap. By four o'clock they were at the head of

the glen. The moon was low on the horizon, but in the east were some signs of dawn.

They plunged into the dark wood, following closely at the heels of Pierce.

"I don't quite like this," said the baron, as his steed stumbled down the narrow path.

"It will be better soon," said Pierce.

It certainly was, and progress became more easy than they anticipated. But there soon came a check. The horses sank rather deep into the miry ground and the baron halted.

"Is there no way round this quag?" he asked. "We shall sink over our heads in this, by the look."

Pierce slipped off his horse.

"There is a path if you will follow me," he replied. He led his horse straight on. The baron tried to follow. Then Pierce's horse began to sink; he made desperate struggles, but got deeper and deeper. Pierce, however, did not stay to help him out, but, leaping lightly from boulder to rushtuft, was quickly out of reach.

It was hopeless to try and follow him. There was a bog on each side of the path, and the floundering horse blocked the way and helped to obscure the proper stepping-places, even had the men known them. The archers were in the rear, ignorant of what had happened, so that Pierce made his escape without even risking a scratch.

It was evident the baron was betrayed. He gave orders for an immediate retreat. But it was not to be ended without interference. From all sides there soon came a galling shower of arrows. The horsemen could do nothing amongst the trees, and the footmen and archers were at a terrible disadvantage fighting against invisible foes and ignorant of the ground. By the time they emerged from the glen half their number were either killed or wounded, amongst the latter the baron himself. Mocking shouts greeted them as they left the wood, Pierce's voice being specially distinct.

The explanation of the ambush is easy. Pierce was tired of the baron's severities, and when he was threatened with hanging unless he was successful in his reconnoitre, thought that the simplest way would be to turn traitor at once and make his neck safe. He was warmly welcomed by Jock and persuaded to return and lead the tyrannical baron into the glen. He was made complete master of the intricacies of the bogs, as the event showed, and had the satisfaction of seeing his stratagem successful.

Jock's desire was accomplished. He had not anticipated so easy a victory. He knew, however, that the baron must ultimately be too strong for him, so he and his companions left the neighbourhood secretly and joined the Scottish king's army. So that when the baron did at last penetrate to the mill he found no one there on whom to wreak his vengeance.

However, he burnt the mill to the ground, and tried to persuade himself he had gained a victory.

THE SEA KINGS OF OLD ENGLAND.

SIR FRANCIS DRAKE.

The Chair from the Golden Hind.

THE first to discover the mainland of America was Sebastian Cabot; the first to take his ship round the globe was Francis Drake. In each case, however, the honour is due to a freak of fortune. The Genoese Columbus only missed the mainland by resting content with the West Indies; the Portuguese Magellan only missed the circuit by quarrelling with the King of Zebu and meeting his death in the Philippines.

Magellan—or rather Magalhaens, for so his name should be spelt—left San Lucar on September 20th, 1519, in command of a Spanish expedition. Reaching Rio Janeiro, he coasted down to Port San Julian, and there spent the winter—May to September—of 1520. A dangerous mutiny then broke out on the part of the officers under his command, who, as in Cabot's case, were jealous of one who was not their countryman. Whereas, however, Cabot put his chief mutineers ashore, Magellan stooped to assassination.

Port San Julian was left in the middle of October; and on the twenty-first of that month, now famous for ever as the day of Trafalgar, Magellan discovered and entered the straits that bear his name. For a month and seven days, during which one of his ships deserted him, Magellan beat through the straits, and on the 28th of November first spread his sails on the Pacific. Sailing right across it, he reached the Philippines after a four months' run, and at Matan he received his death from the blow of a lance. One of the ships was burnt, one was taken by the Portuguese, and the other, the *Vittoria*, under Sebastian del Cano, crossed the Indian Ocean, doubled the Cape of Good Hope, and completed the first circumnavigation in three years and a fortnight.

Of Drake's early life we gave a sketch in our first volume, and with his share in the defeat of the Armada we dealt in the fourth. It was during his voyage in 1572 that he first caught sight of the Pacific. He himself commanded the *Pascha*, of seventy tons, and his brother John had charge of the *Swanne*, of twenty-five. The united crews amounted to seventy-three, and although a third of these were lost, he attacked Nombre de Dios, and other towns on the isthmus, seized the mules from the Mexican mines, and captured several Spanish vessels, the smallest of which was larger than his largest ship.

"After travelling certain days," says the old account, "we came to the height of the

desired hill (lying east and west like a ridge between the two seas) about ten of the clock. And here the chiefest of the Cimarrones took our captain by the hand and prayed him to follow him. Here was that goodly and great high tree, in which they had cut and made divers steps to ascend near to the top, where they had made a convenient bower, wherein ten or twelve men might easily sit; and from thence we might see the Atlantic Ocean we came from, and the South Atlantic so much desired. South and north of this tree they had felled certain trees that the prospect might be clearer.

"After our captain had ascended to this bower with the chief Cimarrone, and having, as it pleased God at this time, by reason of the breeze, a very fair day, had seen that sea of which he had heard such golden reports, he besought Almighty God of His goodness to give him life and leave to sail once in an English ship in that sea. And then, calling up all the rest of our men, acquainted John Oxenham especially with this his petition and purpose, if it would please God to grant him that happiness; who, understanding it, presently protested, that unless our captain did beat him from his company, he would follow him by God's grace."

Drake returned to England in 1573, and with three frigates served under Essex in Ireland. Oxenham, who by turns had been soldier, sailor, and sea cook, got tired of waiting, and in 1575 started for the isthmus in a vessel of his own. Landing on the north side of Darien he drew his ship aground in a creek and hid her with boughs. He burned his provisions and great guns, and with two small pieces of ordnance advanced for over thirty miles into the interior till he struck a river running to the south. On this river he built a pinnace forty-five feet in the keel and embarked in her on the South Sea—the first Englishman to reach it.

He took some Spanish prizes, the gold ship from Quito and the silver ship from Lima, but foolishly set them adrift near his hiding-place. The result was that the Spaniards were led to the river, which had three mouths. Some feathers came floating down one of them, showing that fowls were being plucked on its banks. The English were thus found and attacked, the pinnace and the hidden ship were both captured, and Oxenham was taken prisoner, and shortly afterwards hanged at Lima.

Meanwhile Drake had returned from Ireland, and resumed his preparations for the passage through the Straits of Magellan. His crews consisted of one hundred and sixty-four men, "gentlemen and sailors," and his ships were the *Pelican* of 120, the *Elizabeth* of 80, the *Swan* of 50, the *Marygold* of 30, and the *Christopher* of 15 tons. With this pigmy fleet did he propose to sail round the world and dare the serious perils that had been magnified tenfold by the interested Spaniards. In these days of five thousand ton Arawas built to run round the globe in seventy-eight days, we are apt to forget the seaworthy cockleshells in which our fathers faced the waves. All honour to the tiny *Pelican*—the forerunner of our mighty modern liners, one of which would take seventeen times the tonnage of Drake's entire fleet—as on the 13th of December, 1577, she led the way out from Plymouth for "Alexandria," *alias* the wide Pacific!

With many minor adventures Drake reached Port San Julian on June 20th, and with three ships left that "accursed port" on August 17th. On the 20th they made Cape de las Virgines, entered the Straits of Magellan, and on the 24th anchored ninety miles within them. Here Drake changed the name of his ship from the *Pelican* to the *Golden*

Hind, "out of compliment to Sir Christopher Hatton," of Stoke Pogis, but why or wherefore is not quite clear.

On the 6th of September he entered the Pacific, the fourth who had got through. Magellan had discovered the passage in 1520, Loyasa had been through in 1526, Ladrilleros had surveyed it in 1558, and Drake was the fourth to pass. This he did in twelve days, which, as compared with the weeks spent by the Spaniards, speaks volumes for his skill or good fortune.

On the 30th of September the *Marygold* was lost, and on the 7th of October the *Elizabeth* parted company, and failing to fall in again with the admiral, made the eastward passage and returned home. Drake was driven southward to Tierra del Fuego, and afterwards lost eight men in the sloop. The sloop regained the straits, and steering eastwards, reached Port San Julian and then Rio de la Plata, where six of the eight men, wandering in quest of food, were attacked by savages. Four were made prisoners, and two escaped, closely pursued. The four survivors, all of whom were hurt, rowed to a small island, where two of them died, and the sloop was dashed to pieces in a storm. The two survivors at last went to sea on a plank ten feet long, and after three days and two nights reached the mainland. One of them overdrank himself on the fresh water and died; and Peter Carden, the sole survivor, after many years' residence with the Brazilian savages, and captivity among the Portuguese of Bahia de Todos los Santos, succeeded in regaining his native country, and was duly introduced to and rewarded by Queen Bess, as fully set forth in Purchas.

Drake was driven down to 56°, and on the 28th of October he discovered and anchored at Cape Horn, nearly forty years before Schouten and Le Maire bestowed on it the appellation it now bears. Drake's name for the islands round the Horn was the *Elizabethides*, which fortunately soon became defunct. The whole region of South America had been labelled by the Spaniards *Terra Incognita*. Drake took upon himself to call it *Terra nunc bene cognita*, and as such it appears on his maps.

Drake then steered northwards. At Valparaiso, then inhabited by nine families, he took the Grand Captain of the South, and at Arica, then inhabited by twenty families, they captured several ships, in one of which were fifty-seven brickbats of silver, each weighing twenty pounds. At Callao he surprised seventeen Spanish vessels, and thence he started in chase of the *Cacafuego*, and came up with her off Cape Francisco. She held twenty-six tons of silver, thirteen chests of rials of plate, and eighty pounds of gold, besides diamonds and gems of lesser value.

He made his way up to Nicaragua; thence coasting along, he reached Port San Francisco in California, which he named New Albion, and thence he set out on his perilous voyage across the Indian Ocean, and home round the Cape of Good Hope. He left the Moluccas on the 9th of November, and was nearly wrecked on a reef near Celebes on the 9th of January, 1580. Java was left on the 26th of February, the Cape of Good Hope passed on the 15th of June, and on the 26th of September, after a voyage of two years and ten months, the *Golden Hind* cast anchor in Plymouth Sound. On the 4th of April, 1581, Queen Elizabeth went in state to dine on board the *Golden Hind*, then lying at Deptford, where by the Queen's command the famous ship remained for years until at last it rotted away, and out of what was left of its "carkasse" was made the chair now in the Bodleian, of which we give a sketch.

Oxenham in h's Pinnace on the Pacific.

In 1585, Drake, with Frobisher under him as vice-admiral and Carille as lieutenant-general, was sent to attack the West Indies. On New Year's Day they captured San Domingo, and then, after cruising about the gulf, dismantling many fortresses, the squadron sailed for Florida, and took off the survivors of an unfortunate colony sent out by Raleigh in the preceding year. In 1587 Drake sailed with thirty ships to the coast of Spain, and hearing from a Dutchman that a fleet was lying at Cadiz ready to sail for Lisbon with provisions and ammunition for the Armada, immediately made his way there, and in the course of one day and two nights destroyed ten thousand tons of shipping destined for our invasion. Between Cadiz and St. Vincent he captured a hundred vessels, and then sailed off to intercept the San Felipe, a Portuguese carrack from the West Indies. Before he could reach her track his provisions ran short, but partly by promises and partly by threats he kept his men together, and soon had the satisfaction of carrying home the richest prize that had yet been met with on the seas.

The next year came the Armada, the story of which, as it was given in our part for August, 1882, we need not here re-tell. Of Drake's part—the principal part—in the defeat of the Spaniards it must suffice us here to say that it was gallantly and successfully performed. During one day his ship received forty shot-holes!

Hitherto Drake had had supreme command in his long sea expeditions, and fortune had ever followed him; henceforth he was to share command, and fortune quit him. In 1589 he went with Norris to restore Don Antonio of Portugal; but a dispute arose between the chiefs of the expedition and it returned without doing anything. In the year 1595 he started on his last expedition to the West Indies in company with Sir John Hawkins, the main object of the expedition being to take possession of the treasure at Panama.

One of the ships, the Francis, fell into the hands of the enemy, who thus became acquainted with the plans, and prepared to give

Drake showing Queen Elizabeth's Picture to the Californians.

the English a suitable reception. Hawkins was so much mortified at the disaster that he died of combined grief and disease before Porto Rico. On the evening he died a shot from the town penetrated the cabin where the officers were at supper, knocked the stool on which Drake sat from under him, killed Sir Nicholas Clifford, and mortally wounded Brute Browne. In the morning the assault was delivered and the town captured; but the treasure had been carried off, and the victory proved a barren one. Santa Martha and Nombre de Dios were also taken, or rather found abandoned to the assailants, and then, on the 29th of December, Baskerville started with seven hundred and fifty men on his at-

tempt to cut his way through the Isthmus of Panama. He advanced halfway and then retreated, and returned, depressed and disheartened, to the ships.

This was the crowning disappointment of the expedition, and it threw Drake into a fever, of which three weeks afterwards he died off Porto Bello at four o'clock in the morning. It was the 28th of January, 1595, and Drake was in his fifty-first year.

He lived by the sea, died on it, and was buried in it, deeply lamented by the country whose maritime power and reputation he had advanced more than any of his predecessors. His name will live as long as the world he encompassed.

Drake's Crest.

THE ORIGINAL ROBINSON CRUSOE.

It is usually stated and commonly believed that the world-renowned romance of Robinson Crusoe, by Defoe, was suggested by the story of the sojourn of a Scottish sailor, Alexander Selkirk, on the island of Juan Fernandez. Captain Woodes Rogers, of the Duke frigate, found him on the island, and received the relation from his own lips. Selkirk had been master of the Cinque Ports, commanded by Captain Stradling, a ship that came to Juan Fernandez with Captain Dampier in 1703. On the recommendation of Dampier, Selkirk was made second mate of the Duke—a honourable recompense for his cruel abandonment on the island by his former chief, Captain Stradling. The Duke was one of two privateers fitted out by Bristol merchants, the Duke commanded by Captain Woodes Rogers, and the Duchess by a Captain Cook. The celebrated navigator, Captain Dampier, accompanied this expedition merely as pilot, although during the voyage the skill and experience of the veteran seaman often proved of vast use to the younger captains. In his "Voyage Round the World," Captain Dampier gives an account of a solitary man left on the island of Juan Fernandez, where he remained above three years. He was left there in 1681, and released in 1684, several years before Alexander Selkirk was heard of. The details are perfectly authentic, for Dampier was in the ship which left him in 1681, and which found him in 1684; and Dampier, during a later voyage, commanded one of the two ships, the other of which was commanded by Captain Stradling, the tyrannical chief who left Selkirk on the island in 1704, and he was pilot of the Duke privateer, Captain Woodes Rogers, which took off Selkirk, after his solitary exile of four years' and four months, in 1709. Dampier knew everything about Selkirk's case, but in his earlier voyage he describes this previous abandonment of a solitary man, and his stay for three years on the same island. Here is the narrative as given in his book.

"The nineteenth day (March, 1683), when we looked out in the morning, we saw a ship to the southward of us, coming with all the sail she could make after us. We lay nuzzled, to let her come up with us, for we supposed her to be a Spanish ship, come from

Baldivia, bound to Lima, we being now to the northward of Baldivia, and this being the time of the year when ships that trade thence to Baldivia return home. They had the same opinion of us, and therefore made sure to take us; but coming nearer we both found our mistakes. This proved to be one Captain Eaton, in a ship sent purposely from London for the South Seas. We hailed each other, and the captain came on board and told us of his actions on the coast of Brazil and in the River Plate. He met Captain Swan (one that came from England to trade here) at the east entrance into the Straits of Magellan, and they accompanied each other through the straits, and were separated after they were through by the storm before mentioned. Both we and Captain Eaton being bound for John Fernando's Isle, we kept company, and we spared him bread and beef, and he spared us water, which he took in as he passed through the straits.

"March 22nd, 1684, we came in sight of the island, and the next day got in and anchored in a bay at the south end of the island. We presently got out our canoe, and went ashore to seek for a Moskito Indian, whom we left here when we were chased hence by three Spanish ships in the year 1681.

"This Indian lived here alone above three years, and although he was several times sought after by the Spaniards, who knew he was left on the island, yet they could never find him. He was in the woods hunting for goats, when Captain Watlin drew off his men, and the ship was under sail before he came back to shore. He had with him his gun and a knife, with a small horn of powder and a few shot, which, being spent, he contrived a way, by notching his knife, to saw the barrel of his gun into small pieces, where-with he made harpoons, lances, hooks, and a long knife, heating the pieces first in the fire, which he struck with his gun-flint and a piece of the barrel of his gun, which he hardened, having learnt to do that among the English. The hot pieces of iron he would hammer out and bend as he pleased with stones, and saw them with his jagged knife, or grind them to an edge by long labour, and harden them to a good temper.

"All this may seem strange to those that are not acquainted with the sagacity of the Indians, but it is no more than these Moskito men are accustomed to in their own country, where they make their own fishing and striking instruments, without either forge or anvil, though they spend a great deal of time about them.

"With such instruments as he made in that manner he got such provision as the island afforded—either goats or fish. He told us that at first he was forced to eat seal, which is very ordinary meat, before he had made hooks; but afterwards he never killed any seals but to make lines, cutting their skins into thongs. He had a little house, or hut, half a mile from the sea, which was lined with goatskin; his couch of sticks lying along about two feet distant from the ground, was spread with the same, and was all his bedding. He had no clothes left, having worn out those he brought from Watlin's ship, but only a skin about his waist. He saw our ship; the day before we came to an anchor, and did believe we were English, and therefore killed three goats in the morning, before we came to an anchor, and dressed them with cabbage, to treat us when we came ashore. He came then to the seaside to congratulate our safe arrival, and when we landed a Moskito Indian, named Robin, first leapt ashore, and, running to his brother Moskito man, threw himself flat on his face at his feet, who, helping him up and embracing him, fell flat with his face on the ground at Robin's feet, and was by him taken up also. We stood with pleasure to behold the surprise and tenderness and solemnity of this interview, which was exceedingly affectionate on both sides; and when their ceremonies of civility were over, we also, that stood gazing at them, drew near, each of us embracing him we had found here, who was overjoyed to see so many of his old friends come hither, as he thought, purposely to fetch him. He was named Will, as the other was Robin. These were names given them by the English, for they have no names among themselves, and they take it as a great favour to be named by any of us, and will complain for want of it if we do not appoint them some name when they are with us, saying of themselves they are poor men, and have no name."

* From a capital New Book for Boys, "True Tales of Travel and Adventure." By Dr. Macaulay, Editor of the "Leisure Hour." (Hodder & Stoughton.)

CHESS.

(Continued from page 110.)

Problem No. 88.

By H. F. L. MEYER.

White to play, and mate in three (3) moves.

This problem is built upon the root position No. 40, page 103, Vol. V.

SOLUTION OF PROBLEM No. 84.

White has several moves to prolong the game, which are given here under *a*, *b*, *c*, and *d*.

- a*. 17. P-Kt 3. Kt x Kt (d. ch.)
18. K-Kt 5. R-B 4 (ch.)
19. K-Kt 4. R-B 3 (dis. ch.)
20. K-R 4 (or *c*). R-B 5 (ch.)
21. Q-Kt 4 (or *f*). R x Q (ch.)
22. K-R 3. R x P (dbl. ch.)

To Chess Correspondents.

E. O. (Livorno).—Your game of 17 moves will now soon be published.

P. T. N. MOESVELD.—No foreigner can obtain a commission in our Navy unless he enters it before he is thirteen years of age, and has been previously naturalised.

ENGINEER.—We have no sympathy with English lads entering the combatant services of foreign powers. If you must fight, fight for your old country.

RAOTO.—The active principle in carbolic acid is not rendered inoperative by the acid being vaporised on a heated fire-shovel.

F. P.—For repairing a bicycle tyre use Prout's marine glue, price one penny per stick, obtainable from any Indian rubber shop. There are many imitations of this preparation, some specially prepared for cycle work, and all obtainable from bicycle shops.

C. W. H.—If you read Professor Freeman's book on the English Constitution, published by Macmillan, you will know better than to ask such a question.

BEAVER.—1. The word cañon in "The Silver Cañon" is pronounced as if written "canyon." 2. Carlin-Sunday is so called because of the beanfeast that took place on that day; only the beans happened to be peas fried in butter. It is sometimes called Pea Sunday. It is the Sunday before Palm Sunday.

A MONTHLY SUBSCRIBER.—"Home, Sweet Home" was written by John Howard Payne, and was first sung in his drama of "The Maid of Milan." The music was written by Sir Henry Bishop.

A NIGGER.—1. We do not know of a guide to "the bones," nor of any music specially written for that instrument. The great secret is to waggle them furiously, and make as much noise as you can. 2. The "blacking" is simply powdered burnt cork.

FRANK.—Give your saddle a coat of soft-soap. It will stain it as agreeably and quickly as anything.

CIVIL SERVICE.—It is difficult to say. You have to give references before you are appointed, and the strictest inquiries are made as to your previous good character.

A LOVER OF KITES.—Mr. Pocock's book on "Kites" is out of print. You might get it through a second-hand bookseller. There is no other book specially on kites that we know of.

A YOUNG WELSHMAN.—Consult a lawyer; never apply to a layman for legal advice. The Married Woman's Property Act is the one you are in search of.

J. B. M.—The half-mile has been run in 1min. 55³/₄sec. by L. E. Myers. The best English record is W. G. George's—1min. 57sec.

T. F. M.—The "Fifth Form at St. Dominic's" was in the fourth volume. It began on October 1st, 1881, and ran for thirty-eight weeks.

H. S. BOULT.—Beehives can be obtained from Messrs. Neighbour, of Holborn, and other firms. See advertisements in gardening papers.

T. H.—Appointments in the Colonies are either made through the Colonial Office, in which case the examinations take place here under ordinary Civil Service regulations, or through the Colonial Governments, when the examinations take place in the colony.

JIM.—The present inhabitants of New Zealand are, we suppose, called New Zealanders; the natives they found there on arrival were the Maories. In Stewart Island, however, there is an older race.

EVACUATE.—If a young lady were to conclude a letter to us with "and believe me to remain, yours truly," we should in reply ask her to believe that we remained yours truly. In fact, there is no safer rule than to answer a letter in the terms and spirit in which it is written.

WONDERING HOW.—There can be no doubt that the voyage would do the lad good, but we should never advise a boy to be apprenticed unless it was intended that he should follow the sea as a profession. The earlier part of a sailor's life is always the most objectionable.

OLD WOMAN.—1. If you yourself keep a good-sized tomcat, and treat him well, he will very soon perceive the annoyance you suffer from the cats of your neighbours, and make it his business to clear them off the premises at all hours in double-quick-time. 2. The only profession in which a knowledge of Hebrew would be useful would appear to be that of the ministry. 3. For the scholarships at the Universities you should consult the University calendars. 4. The question is too vague.

M. C. S.—You will find how to make ice cream in the April part for 1881.

W. WESTMORELAND.—Particulars as to Government appointments only hold good for the month of publication. The post you mention is no longer open to public competition. For all particulars apply either direct to the Admiralty or to the Civil Service Commissioners in Cannon Row. Full particulars as to the examinations for the Navy are given in the quarterly Navy List, published by John Murray, Albemarle Street, but you can only trust the current number.

NESTOR.—Read our articles on the Bar in "Professions, and how to enter them," in July part for 1883.

YELLOWHAMMER.—We can but regret that any lad's friends should discourage his study of natural history on the ground that he is "now growing to be a man, and should be thinking of something better;" and you have our sympathy in your uphill struggle. Stick to your hobby as long as you can, work at it thoroughly and conscientiously, and if you cannot convert your friends you may at least convert their children, and save them from becoming the victims of such stupidity. The only book that would fulfil your requirements is Morris's "British Birds," or "Bree's Birds," each of which costs about three guineas. There are 322 species of birds reckoned to be British. Articles on entomology appear in all the volumes. See answer to B. DERBYSHIRE.

BRITON.—The best lubricant for wood on wood is a mixture of milk and blacklead.

C. M. LAWTON.—Dr. Lankester's "Half-Hours with the Microscope" is a cheap book on the subject; but there are several shilling books issued by the London publishers, and obtainable at most bookstalls or opticians.

MEM.—In our fifth volume we gave an article on the Pantagraph, and how to make and use it. Refer back.

E. H. H.—1. The pronunciation of Giaour is as nearly as possible that of Jower. 2. Your master should explain his meaning; he is more competent to do so than we are. 3. For fretwork machines you cannot do better than try Churchill.

PAGANINI.—It is a matter of taste. Some players prefer gut strings, others silk. We should say that nothing can equal a good gut string. The silk will stretch, but not to so great an extent as the gut; it will, however, wear fluffly.

DISHEARTENED FIDDLER.—1. Leave the three notes alone till you can be practically shown how it is done. 2. If you lightly place your finger on the centre of the string you will get its octave. 3. The only plan is to get the A string correct, tune the second to it by chord or stopping, tune the fourth to the third in the same way, and then tune the first to the second. As the fourth stop and the next open string give the same note, you can easily check your tuning.

DUMBBELLS.—Dumbbells should never exceed two pounds in weight. If you want something heavier use Indian clubs. See our articles on Gymnastics in the third volume, and on Indian Clubs in the fourth.

X. K. C. and CALEDONIA.—We never offer criticisms on such contributions: you must judge for yourself, or get others to do so for you. It is not customary to pay for such compositions: the newspapers insert them gratuitously as far as the author is concerned, and in some cases even charge for them as advertisements.

H. H. S.—1. Try Oliver's "Botany," or the manuals by Henfrey, Balfour, etc. 2. We could fill the paper with an exchange if we were so minded, but have no intention of providing such a temptation to dishonesty. If you will get a number of the "Bazaar," or "Exchange and Mart," and see the regulations that are necessary to work the subject properly, you will understand our reasons for abstaining from it.

NEMO.—You must join the ranks of the volunteers and work up.

FOFA.—Apply to the Registrar of the University of London, Burlington Gardens, or the Registrar of Victoria University, Manchester, for particulars of examinations for the degree you desire to go in for.

E. M. WILLIAMS.—We thank you for the detailed information, but as it will probably be out of date in a few months, and our readers forget that examination regulations given in back volumes may have been since superseded, we are unable to use it. A copy of the quarterly Navy List will always give them the latest particulars.

HERBERT.—1. There are several books of family crests obtainable from heraldic stationers. Being in the trade you would get one easiest through your master. 2. Bleach ivory under glass, or wash it in a solution of an ounce of nitric acid in ten ounces of water, brushed on with vigour and thoroughly rinsed off in clean water.

B. O. P.—Read the article again. It does not say "the Admiral of the Fleet is giving instructions." All the difficulties you raise were anticipated in the article. A hasty skim from title to tail-piece is not reading. It is a habit easy to acquire and difficult to lose, and only results in waste of time—to yourself and other people.

J. K. JOHNSON.—Queries as to the numbers and stations of lifeboats should be addressed to the Royal National Lifeboat Institution, John Street, Adelphi, and not to us.

T. M. L.—The Magyars are the Hungarians. The Transvaal stamps are all poorly printed. The one you sent was genuine.

X. Y. Z.—Indian-ink pricked into the skin is tattooing, and you will remain disfigured for life. You cannot get such marks out. See our article on Tattooing in No. 272.

PERSERVERANDO.—Shorthand is useful for everybody: there can be no question about that. Pitman's system is generally considered the best; those recently advertised are but modifications of it. The address is Paternoster Row.

S. EVERETT.—You can get fencing foils from all the cricket outfitters. They cost from six shillings to a guinea per pair; the blades alone are from eighteenpence to half-a-crown each.

JACK OF HAZELDEAN.—The delay in publishing the results would be so increased that we could not adopt your suggestion. Coloured plates have to be prepared more than twelve months in advance.

J. BROWN.—Fluoric acid is what you mean, but the ovals are cut with the diamond. A two-cell battery would not be strong enough for an incandescent light.

DELORAINÉ.—Wash the fly in alcohol or spirits of turpentine, and when he is dry mount him in Canada balsam, which you can get from the nearest chemist.

DIET.—To make oatcake mix moderately fine oatmeal to a stiff paste with boiling water; roll it out thin, bake it in a slow oven, do not let it brown, and when it is done dry it before the fire.

FLAGS.—We have had a series of articles on Signals only recently. There was an article on Flags in the first weeks of October, 1882, and of October, 1883, and there was one on Storm Signals in No. 58.

A FOOTBALL PLAYER.—You may discover a cure for "a red nose not caused by drink" by applying to a doctor. We cannot tell you to what it should be assigned. We know nothing of nosology, and never answer medical queries.

T. H. CHURCHER.—A book on ticket-writing is published by Messrs. Crosby Lockwood and Co., Stationers' Hall Court. Mix your colours with varnish.

YACHTIST.—You might get a good second-hand boat by advertising in "The Model Yachtsman." It is published in High Street, Hull, price eighteenpence per annum post free. It comes out on the first of the month, and costs a penny per number. You can get it in your neighbourhood of Mr. H. Butcher, 7, Bedford Terrace, Kensington.

DEVONIAN.—Distilled water boils at 212° in the open air, but in a closed vessel you increase the pressure, and hence the 212° can be exceeded. From ignorance of this trifling fact your argument is a mere waste of time. A little knowledge is dangerous, even in a Devonian.

A WOULD-BE SAILOR BOY.—You will never get a situation on board ship unless you make personal application to the Mercantile Marine Office, to the owner, or to the captain, and the sooner you give up the idea the better.

COLONIC.—Emigration to Australia is now worked on the nomination principle. A colonist applies for a ticket to bring out his friend, and sends it over to this country, and then the fares are very low. Four pounds will take a young man; two pounds a young woman, to Sydney. To go to Queensland costs eight pounds, but young women are in demand there, and so can get out at one pound apiece. To New Zealand a young man can go for four pounds, a young woman can go for nothing. Be it understood this is only on nomination tickets, and the information only holds good for the month of publication. Apply direct to headquarters when you think of going. The New South Wales offices are at No. 5, Westminster Chambers, Victoria Street; the Queensland offices are at No. 1; the New Zealand offices are at No. 7.

C.—All that shipping of boys from quays and docks is now done away with. If you want a berth you must apply at the Mercantile Marine Office, which is a branch of the Board of Trade. Try Poplar or St. Katharine's Docks.

P. B.—1. Kennington Oval is ten and three-quarter acres. It is the property of the Duchy of Cornwall. 2. The "Daily News" first started on January 21st, 1846; the "Daily Telegraph" on June 20th, 1855; the BOY'S OWN PAPER on January 18th, 1879.

G. H.—The steeple is the whole thing, tower and all; the spire begins at the top of the tower. Many Nonconformist places of worship have steeples, and the saying you quote is a popular delusion. The old story of the tall boy whose mother intended him for the Church, and whose aunt thought she intended him for the steeple, might have put you on the right track.

FIDDLER JOE.—1. The best violin bows are those that have most spring, but they must not be too stiff. 2. The hairs are cleaned by washing in soap and water and thoroughly rinsing afterwards in clean water. 3. Mix together some vegetable black and gold-size until it is as thick as cream, and give the violin-case a coat of it. It will dry in a very short time. Use a soft brush, or it will look streaky.

MKT. HARBOROUGH.—Surely, if you had knowledge enough to read the R., her Majesty's signature as standing for Regina, you might have detected in the I. the initial of Imperatrix—Queen of the United Kingdom and Empress of India.

THE "BOY'S OWN" CHRISTMAS NUMBER.

OUR Special CHRISTMAS NUMBER is now ready, price 6d., and may be had of all booksellers. Every reader of the B. O. P. should endeavour to secure a copy at once. It cannot be reprinted, and will NOT be included in the Annual Volume.

The Contents include the following stirring contributions:—

Breaking Up. By Somerville Gibney.
An Acting Proverb. By Paul Blake.
A Midnight Visitor. By Edmund Mitchell, M.A.
The First Day of the Season.
The Derelict Brig: a Tale of the North Country. By Dr. Gordon Stables, C.M., R.N.
"Catch me if you can!"
A Midnight Swim. By Robert Richardson, B.A.
The Middy's Plum Pudding; or, a Christmas Dinner on Board a Slaver.
Christmas Matin Song. Words by Paul Blake; Music by Arthur Hudson.
Findings not Keepings: a Christmas Story. By F. L. Rowton.
"God rest you, Merry Gentlemen."
Winter Sports in Canada.
Christmas in a Tree-Stump. By Theodore Wood.
Fascinated by a Fakir. By James Cox, R.N.
Round the Christmas Fire. Roman Puzzles.
"Var da Vaigher" (Guide the Wanderer).
Home for the Holidays.
Bilk's Fortune. A Ghost Story. By T. B. Reed.
Chromatropes and Paper Fireworks.
A Race for a Christmas Cup. The Ice-Yachtsman's Dream. By W. J. Gordon.
Picture Plaiting.
"Follow my Leader!"
A Snowskate Race in Lapland.
Mirror Magic.
Our Christmas Penny Readings. In the Signal-Box: a Stationmaster's Story. By G. E. Sims.
The "Yule-Bau." An Adventure in the Shetland Isles. By Jessie M. E. Saxby.
Christmas round our Coast.
Crabbe's Practice. By A. Conan Doyle, M.B., C.M.
Yule-Tide Amusements.
A Storm in a Teacup.
Two Striking Experiments.
An Evening at Home.
The Obedient Cane.
Out in the Snow.
The Kaleidoscope, and How to Make it.
Christmas Fares.

No. 308.—Vol. VII.

SATURDAY, DECEMBER 6, 1884.

Price One Penny.
[ALL RIGHTS RESERVED.]

PETER'S PERPLEXITIES IN PURSUIT OF SCIENCE.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER I.

"PLEASE let me in, Dobbin; I won't bear-fight," and a gentle application of the speaker's toe to Dobbin's study-door accompanied the request.

Charlie Ross was a small boy in the fourth class. Dobbin, alias Peter Carruthers, was in the first, and it might be assumed that he was therefore far above

his junior in social and political importance. But assumptions are not always reliable, and if we draw a comparison from the poultry-yard, Charlie Ross might represent a spick-and-span young bantam, strutting about with a chirp and a crow for every one, while Peter Carruthers would more nearly resemble

a sick and sorry old chanticleer, with plumage always ruffled, pecked and chased from one end of the yard to the other, feeling no respect for himself, and consequently eliciting none from his companions.

Different as these two boys were in disposition, they were nevertheless chums.

"He might be seen careering wildly down the playground."

Ross, in the generous simplicity of his nature, felt compassion for the old booby, and the old booby was glad enough to avail himself of the proffered patronage.

Carruthers had received the nickname "Dobbin" from some facetious wag, who recognised a distant resemblance between his aristocratic surname and the plebeian word "carthorse." Dobbin was an eccentric character. I should not be surprised if some day he were to turn out a genius, and astonish the world by a brilliant discovery or two, for he certainly had a strong bent in the direction of science when at school.

One of his favourite notions has frequently engaged the attention of scientific men, but success has not hitherto crowned attempts to solve its difficulties. Dobbin had an idea that the problem of aerial flight was within the grasp of human ingenuity. He often meditated deeply on this abstruse question. He might be seen at times careering wildly down the playground, spreading out the skirts of his coat to their widest extent, and executing frantic leaps and gyrations. His coats were invariably loose, to allow for growing; and if a high wind prevailed, his movements were not altogether unlike those of a frolicsome porpoise curveting and gamboling in the sea.

He would occasionally bring in the corpses of rats, found during his walks abroad in the vicinity of wheatricks and farmyards. These were secreted under his bed, to be dissected with his pocket-knife as occasion offered, a custom neither pleasant nor wholesome, and from a master's point of view not to be condoned even under that specious excuse, "the pursuit of science."

He once brought home a live snake, which he tied up in the leg of an old pair of trousers, and fed upon worms for two days in his bedroom, unbeknown to his companions. When it was eventually discovered, Dobbin and the reptile were promptly assailed by the other inhabitants of the dormitory, and the offender, habited only in his nightshirt, had to catch up his pet and beat a hasty retreat down the passage, followed by a shower of slippers, gym-shoes, sponges, tooth-brushes, pieces of soap, fives-balls, and whatever other missiles chance put in the way. The renegade was not readmitted either until by vows of penitence and entreaties, and promises of handsome reward, he had appeased the indignation of his companions.

Dobbin's reward took the shape of stale tarts, procured from an old apple-and-gingerbread woman who lived near the school. By way of surprise he put one of these tarts in each boy's bed in his dormitory. When, therefore, the boys prepared to retire to rest that night they found the tempting delicacies displayed to view. But, alas for the short-sightedness of the unlucky Dobbin! The tarts were of the kind known to confectioners as "open," and the jam had in most cases manifested such "chemical affinity" for the upper sheet that it had almost entirely parted company from the crust. One boy had unwittingly scrimmaged on his bed, and the general havoc occasioned by the squashed tart may be more easily imagined than described. Suffice it to say that the results of Dobbin's device differed strangely from his expectations. There was a general howl of disgust and

clamouring for vengeance. But I draw a veil over the subsequent proceedings, which are really too painful to record.

In consequence of these vagaries Dobbin had what may be termed "a lively time of it." He learnt with bitter reflection the melancholy truth that no sympathy with his deep pursuits was to be expected from his comrades. He became moody and depressed, he shunned the society of the other boys, and in the solitude of his study he would meditate gloomily on his blighted hopes, and only practise with extreme caution and secrecy his attempts to pry into the mysteries of Nature.

Such was his frame of mind that afternoon when Charlie Ross stood at his study-door demanding entrance.

Now it must be admitted that there was some excuse for Dobbin's pranks. Doctor Porchester had lately introduced experimental lectures in science as an attractive feature in the routine of scholastic studies. A learned professor had actually come down from London and sojourned for a fortnight at Highfield House. The boys had been electrified and magnetised; they had enjoyed ocular demonstrations of the existence of chemical force; they had been delighted with fizzings and explosions, and half suffocated with the fumes of noxious gases, which set them coughing like a flock of sheep; they had been half blinded by the burning of phosphorus in oxygen, and witnessed many other marvellous experiments. In fact, they had been initiated by pleasant paths into the realms of scientific lore.

This digression must be lengthened a little further to record that after the last lecture, when the room was being set to rights for evening prayers, and the butler was wiping down the table, his dignity had been completely upset by the behaviour of sundry portions of that whimsical element sodium. These had been spilled inadvertently about the table, and had remained peaceable enough while undisturbed. But now, as with vigorous sweeps of his cloth, the lord of the pantry began to subject these particles to friction such as they had never before experienced, coupled with the presence of abundant water—their appetite for oxygen became so intensified that they bubbled and squeaked, and fizzed and exploded, and spurted and flamed, and ran frantically about in red-hot balls, tumbling and bursting like shells with fiery scintillations upon the floor. It was by far the most effective experiment of the evening!

The bearing of the gallant butler under this trying ordeal was truly heroic. He winced perceptibly at each explosion, but did not draw back his hand nor cease to ply his mighty strokes until the table was purified, and all danger removed of volcanic outburst. He might have been Gulliver wiping off an army of Liliputians, who were bravely contesting every inch of the ground, and shelling the giant with red-hot shot.

Now it might well be supposed that under the influence of such stirring scenes as these, the youth of Highfield would not be slow to develop a taste for chemical investigations. But such is the contrariness of puerile nature, that few of the boys were moved to make personal researches. The generality of them loved "a good stink," as they irreverently styled the less agreeable odours; and an

unexpected explosion was "nuts" to them; but beyond this they cared little to enter into the why and wherefore of what they saw. The entertainments gradually grew flat, and from the Olympian heights of "jolly fun" (as they were considered at the outset), the lectures subsequently descended into the Tartarean depths of "awful rot" in the estimation of the majority.

It is needless to state that poor old Dobbin formed an exception. He took the deepest interest in the lectures. He was ever ready in moments of emergency to hold a jar, to warm a retort, to carry off a vessel that might be disgorging offensive fumes; in fact, he was the professor's right-hand man. Dobbin would take copious notes of the experiments, and compile them afterwards into treatises of an original character, and expressed in language which could not always be considered scientific in accuracy nor grammatical in form. For example: "If you mix something with sulfuric acid you'll make an awful stink. Warmed stuff like salt and black-lead gives oxejin. Fosphoras burnt in it gives splendid light. Pottasum likes hidrojen."

Dobbin was engaged with his notebook when the importunate entreaties of Charlie Ross for admittance disturbed his meditations. "Please let me in, Dobbin!"

"What d'you want?"

"Oh, I want to speak to you awfully particular. Please let me in."

"All right; wait a jiff."

The jiff having elapsed, during which fraction of time Dobbin hastily concealed a box of fuses, a piece of brimstone lately abstracted from a dog's tub of water, some fragments of glass tube, and a paper of gunpowder, the hero cautiously unfastened the bars of his castle. He feared this might be a dodge practised by some of the other fellows to gain entrance for unlawful ends, so he planted his foot against the door as he opened it two inches, and looked out. Seeing no signs of the enemy, he let Ross in and quickly bolted the door once more.

"I've got to write out my rep. for the Doctor, Dobbin, and if you'll let me do it up here I'll be very quiet."

"All right; there's the ink. I haven't got a pen. Oh! I see you have."

The pen was soon scratching away, interrupted by periodic sighs and groans, and a hint from Peter the Hermit whenever the fancies of Phadrus presented a formidable aspect, which they seemed to do every second line.

It had been a wet half-holiday in the Easter Term. Most of the boys were in the gymnasium. Ross had a cold and was kept in the house, and his friend cared not for feats of muscular contortion.

At length the rep. was finished, and Ross asked the philosopher as to the nature of his abstruse speculations.

"I'm going to try an experiment. It will be the grandest I've ever done."

"What's it to be?"

"Will you promise not to say a word to any one about it?"

"Rather!"

"Will you come with me when I do it? I shall probably want an assistant."

"Oh yes; do tell us."

"Well, it's a very dangerous job, and may possibly blow us both up!"

"That'll be awful sport, Dobbin!"

"Well, if you'll really promise not to let it out—"

"Oh, I'll promise faithfully."

"Well then, look here. But I don't believe you can keep a secret, Ross."

"Oh, bosh! I promise you I can!"

"Well, then, I'll tell you. Professor Stubbs told us the other day that guncotton is common wool steeped in sulphuric and nitric acids. I'm going to make some."

"Jolly! What shall we blow up?"

"It's an experiment which nobody ever made before."

"You're nobody, and you'd better make it behind, or the Doctor will catch us."

"Don't be an ass, Ross. It misbecomes a rat to be an ass."

The conversation was broken off at this point by reason of the rat's jumping on the carthorse's back, and riding him round the study three times, which same ride was brought to a conclusion by the carthorse backing on to a chair, over which he tumbled, and horse, rider, and chair were involved in ruin. Order being restored, the philosopher proceeded.

"I don't believe any one ever thought of what I am going to do; but if it succeeds it will be very valuable in time of war, and I shall write to the Government about it. I expect it will be all right. It may seem rather cruel to you, Ross, but we can't always avoid giving a little

pain to animals in making important discoveries."

"Well, do let us hear what on earth you're going to do."

"I'm going to make guncotton on a large scale. But it's a very dangerous dodge. I shall have to think it over for a long time, and there will be so many things to arrange that I don't suppose it will come off this term. In fact, I think I shall put it off till the holidays."

"Oh, no; we'll do it at once. But do tell a chap what it is?"

"Well, look here. If guncotton is only cotton-wool soaked in acids, why shouldn't it be possible to turn the fleece of a live sheep into guncotton? And if it could be done to one it could be done to a whole flock. And only think what that means. If ever England should be invaded the farmer's would have to give up their flocks. I've thought a good deal about it. Say an army of 20,000 men was encamped on Salisbury Plain. The explosion caused by one full-grown guncottoned Southdown sheep would be sufficient to kill at least 20 men. Consequently it would require 1,000 sheep to destroy 20,000. Only think of that! A whole army blown up at the cost of only 1,000 sheep! Think what a saving it would be to the Government. The taxes would be let off. The nation would rest secure in the possession of my grand

secret, knowing that it had nothing to fear from invasion."

"I say, that's a grand idea, and no mistake! But how should you let off the sheep?"

"Oh, I've thought of that. I shall invent a sort of cracker, so constructed that you can time its bursting. That's easy enough, you know. Every inventor soon hits upon the small dodges for making his invention answer. The cracker could be tied to the sheep's tail. A harmless-looking shepherd would be told to drive the flock in sight of the enemy. They would rush out to capture it. We read in Latin the other day that they always do that in time of war. Say it would take twenty minutes to get the flock safe into camp. Allow five minutes more for the soldiers to collect round to see it. An hour would be ample from the time the flock was sent out of our lines, so I should make all the crackers to go off an hour after they were lit, and our soldiers would only have to sit still and smoke their pipes and wait for the explosion. Isn't it a splendid idea, Ross?"

"I should just think so! It's all bosh waiting for the holidays when you've already planned it all out. I vote you try the first experiment on Saturday."

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

BY PROF. J. F. HODGETTS,

Author of "Harold, the Boy-Earl," etc.

CHAPTER III.—OZOONOVO.

IN the terrible calamity which we have already recorded as happening at Berozovo, the whole house perished. Old pictures, the gift of Peter the Great, a snuffbox presented to an ancestor of the proprietor by the Empress Catherine, a number of books, chiefly in Russian or in French, furniture, dresses, and other property, perished in the flames.

Tenterton and the steward, as described in the first chapter, took the portmanteau between them and walked, or rather ran off with it to deposit it in a large building devoted in days of yore to the reception of numbers of carriages, sledges, carts, and other vehicles. Now, however, the requirements of the family had ceased to demand accommodation on so gigantic a scale, and a caleche, a prelyotka (or hooded gig on four wheels), a landau, two or three specimens of the odd-looking vehicle called a tarantass, some sledges, and an English wheelbarrow without a wheel and with only one leg, completed the collection, leaving a large space unoccupied, which was now destined to receive the articles saved from the burning ruins.

Having seen his worldly possessions in safety, Tenterton returned with the steward to the scene of the conflagration, earnestly bent on rendering what aid he could in saving the property of others. Suddenly he was startled by an appalling shriek which seemed to come from the part of the house to which the "ladies' door" led. He rushed to the quarter from whence the sound proceeded, and found a number of women assembled, consisting of the lady visitors,

the female servants, governesses, and various hangers-on, all grouped around Madame Abrazoff, who had just uttered the piercing shriek which had so alarmed Tenterton.

"Pray what is the matter? Can I help?"

"Oh, my jewels! My diamonds! Some of which are priceless. I am ruined without my diamonds! What shall I do?"

"Where are they?" asked Tenterton.

"There in the room next the entrance to my apartments, but all the rooms are full of fire and smoke. It is useless, hopeless, to seek them. I left them on a marble table between the two side windows."

Off flew Tenterton like a shot, and was soon lost to view as he plunged into the blazing pile. In the first moment he felt that he must retreat for want of air. The penetrating nature of the wood smoke seemed to sting every portion of his skin, to enter into his very heart and almost paralyse him. His eyes smarted, he was more than half choked by the fumes and scorched by the raging flames.

Still he dashed on; and partly by guess, and partly by that rare faculty which seems specially awakened in many men when threatened by danger, was safely guided to the boudoir in which the treasure lay.

By the glare of the flames he was enabled to see a box like a writing-desk encased in a covering of black leather standing on a console table. He had sufficient presence of mind to remember that the jewel-case was stated to be on a

marble table between "windows." He seized the box, and had barely strength enough remaining to stagger to the right-hand window (which was now nothing more than a charred and heated aperture in the burning wooden wall) and fling himself with his precious burthen into the garden below—a fall of some three or four feet only—when he fainted from the combined effects of excitement, heat, and smoke.

How long he lay in this condition of course he could not be expected to know. When he regained his consciousness he was nearly deprived of it again, for he found himself on a bench in a peasant's hut, where the odours inseparable from the habits of life peculiar to the Russian lower classes are known by those who have experienced their strength to be more powerful than pleasant. Added to this was a strange feeling in the right leg, which increased to a stage of excruciating agony when he tried to move.

The peasant owning the hut came in to see whether anything was required, and finding Tenterton awake, addressed him in very choice Russian, of which, however, Tenterton only understood some two or three words, but the expression of pain in his countenance was too acutely depicted to leave any doubt as to his sufferings, and the peasant rushed out to seek Paul Nicolaevitch, with whom he returned in a very short time, and who really seemed much concerned at the evidently critical position of the young Englishman. He at once dispatched the peasant with a message to his father requesting his immediate at-

tendance, and so well and quickly did he perform his mission that Mr. Abrazoff was at the side of the sufferer in an incredibly short space of time.

"My dear Mr. Tenterton," he exclaimed on entering the room, "how sorry I am to find you here! We are all greatly indebted to you, and my wife especially so. You have saved quite a fortune for her. She will be here herself directly to thank you."

The change in manner which had come over Mr. Abrazoff was something wonderful, and diverted for a moment the attention of the patient from his sufferings. The Russian is very keenly alive to service done for him, and not infrequently is quite overcome with gratitude for even trifling kindness done from a feeling of good will. The rescue of the jewels seemed to have exerted a remarkable influence on the generally morose and ill-tempered Abrazoff, and he was—to Tenterton, at least—another man. He began to inquire into his hurt, and on finding how grave the matter looked, became very anxious and serious indeed. He called the peasant to him and demanded, "How soon will people be back from Riazan?"

"To-morrow evening."

"Too long to wait. What is to be done? A doctor must be had immediately."

"You told Trifon to bring a doctor with him, but he went in the teleyga [a sort of light cart], and cannot reach Riazan before some time to-day."

"When did he start?"

"Just after the fire broke out last night."

"Then mount the best horse in the stables and drive off to Orekhovo. Take a return ticket for yourself, and lose no time in seeing the best doctor in Riazan. Bring him back with you. I will take care that a droschky with two horses is in waiting at the station to bring you along. Now be off! Here are thirty

roubles, you will not want more, and start at once."

given in Russian, and secondly because his wounds pained him so as to render him almost incapable of thought. The peasant departed on his errand, and Abrazoff sat down on a dirty rickety stool to bestow more attention on his young guest, as he asked him in kind tones about his wounds, but Tenterton was too much overcome with the exhaustion of excessive pain to understand what was said to him, and Abrazoff became more and more alarmed as delirium seemed to set in. He tried, with the assistance of his domestic servants, to remove the patient to a mattress which he caused to be laid on the floor, but the agony produced by all attempts at changing the position in which he lay caused them to desist.

The small house of the intendant, or steward, had been converted into a temporary lodging for the ladies, while the steward himself had turned out into the hut of one of the wealthier peasants, who was only too glad to receive him.

All the peasants had been pressed into the service, and were working with a will among the ruins. Two small hand fire-engines had been got out of their usual place of durance, but the gardeners had borrowed the tubing and had only returned a portion of it to the outhouse where the engines were kept, and this was not sufficient to reach more than half way to the river, and by the time the missing length was found there was nothing left of the house to save.

But, as the gardener observed, "It was all one. What was to be done? If the tubing had been found the engines would have been of no use whatever against such a fire. As it was, the magnificent court dresses of Madame Abrazoff had been, as by a miracle, saved from the flames. The young Englishman had saved the diamonds, and if the blessed picture of the patron saint of the family—which the priest had duly held up against the

a cigarette when the door of the hut in which he was now located was opened, and who should enter but Madame Abrazoff herself.

"Take me at once to Mr. Tenterton," she said.

"He is lying in one of the poorer huts, badly hurt, quite impossible for you to see him," was the reply.

"Impossible! What do you mean? I must see him. Do you know that at the risk of his life he has saved what, for many reasons, is dearer to me than my own—of more consequence to me than all the house full of things besides. And he is badly hurt in performing this grand service for me, and shall I not see him and perhaps help him!—take me and Marie Nicolaevna to him at once!"

As the Russians say, "There was nothing to be done" but to comply with this mandate, uttered rapidly but with remarkable decision. So Ivanoff led the way, wondering at the odd idea of a lady going to visit a "teacher" just because he was a little "singed," as he expressed it. When they reached the door of the hut he was still more surprised to find the "barin" himself and the young barin seated in the wretched hovel talking to Tenterton, who seemed to know nothing of what was being said to him.

"Ah! Nicolai Alexandrovitch!" exclaimed the lady, "I am most glad you have come here to aid this brave young Englishman who has done so much for me. None of the others stirred to help. Anton Petrovitch never offered any assistance. My own son never attempted to save these precious gems, and of all my friends no one was willing to help me, and I owe the possession of my treasure to a mere stranger whom I had never seen till yesterday!"

Mr. Abrazoff did not seem to relish this speech. Whether it was that he disliked to hear other people praised, or that he was annoyed at the dispraise lavished on his own friends and household, we cannot tell, but his countenance assumed the same sinister expression that we saw it wear in the carriage when the death of the old foster-mother was announced to him by the villagers. But he said nothing.

The lady could not help remarking the cloud that passed over her husband's brow, but she had too much tact to let it appear that she felt the change. She very adroitly led his thoughts into their natural channel—avarice—by saying,

"You see, at all events, that without those jewels we should have been in a very different position. Apart from their value there is the document which you obtained from your father giving the whole of his possessions to our Pauly if your brother died without leaving a son. You often told me that he was killed in action, and was never married, so that Paul is a rich boy now, and you, as uncontrolled guardian of your son and all his wealth, are richer than any man in all the district."

These words seemed to fire a train of thought which exploded in these words,

"Katya! [the diminutive of Ekaterina] Did you ever find that accursed will?"

"What will?"

"What will! why, that of which we have so often spoken, in which Ivan was acknowledged to be the elder brother, and all things, great and small, were left to him and to his heirs for ever, leaving

roubles, you will not want more, and start at once."

Paul, or Pavel, was astonished at this unusual energy on the part of his father. Tenterton, of course, understood little of all this, first because the orders were

flames—had failed to extinguish them, what could be expected of two old pumps?—made in Germany too!" he added, with withering contempt, as a clincher.

The intendant was just about to light

me a paltry fifty thousand roubles! Have you forgotten it?"

"Certainly not, I have hunted everywhere, upstairs and down, I have turned out all the writing-tables in your study and in the library, in my own and in Marie's rooms—in short there was not a hole or corner left unsearched by me. But yet it cannot matter. He is dead, he had no children. All is over now. And if the stupid will could ever have done harm, its power to hurt is ended! Those flames have put a stop to any fears on that account!"

"If I only could have seen the wretched scrawl burnt up before my eyes, I should have felt more happy. But there's a doubt, and doubt is more distressing than any other ill! The doubt can never be solved now that the house is burnt."

Here an involuntary exclamation, half sigh and half groan, broke from the sufferer and made both wife and husband start.

"You see I quite forgot the wounded Englishman," cried Madame Abrazoff, rushing to the wretched bench where Tenterton was lying. She went up to him, took his hand in hers, and cried,

"I hope your wounds are nothing serious; burns always are so painful, but I feel quite sure no graver harm is done than those distressing burns; no bones at least are broken! But still our debt is just the same."

Tenterton felt the charm of her gentle voice; and as Madame Abrazoff spoke, it seemed to assure him that he was not left friendless in his pain. It seemed as though the previous conversation, of which, of course, he understood very few words, for it was carried on in Russian, must have referred to him. Soothed by her tones, he asked her faintly to tell some servant to bring him a glass of water.

She immediately rose, and without noise, without bustling about the room, had contrived to obtain for him a glass—a clean glass, too—full of delicious water. And Tenterton has often said that in all his life he never had a draught so fresh, so pure, and so delicious.

She looked a moment fixedly at Tenterton, and then said, in a low, soothing tone,

"Your wounds seem very painful; you must not lie suffering here. A doctor has been sent for to the nearest town, and until he can come and see what is to be done you must be moved to us. The house where we are is not very large, but it is clean compared with this, so I shall send the servants to remove you immediately."

Then turning to Abrazoff, she exclaimed, "I fear this is more serious than you at first supposed. He is a brave boy and will not cry and groan like a baby that has burnt its finger. Let him be moved to our place yonder, and let him have the best room in the house. We are not injured, and, besides, I am going to the Narishkins' as soon as the things saved can be packed."

To do Abrazoff justice, he never contradicted his wife. He seldom followed her advice, it is true, but as to openly contradicting her, it never occurred to him for a moment. So he just said, "As you please," and left the hut.

When he had really gone Tenterton seemed more able to speak, for he said, with considerable effort,

"Pray, do not take any trouble. I

would much rather lie here; in fact, I could not bear to be moved."

"Is the pain so dreadful?"

"It is very bad."

"Run, Pauly, and call the intendant," she cried to her son.

Pauly's pace was not so rapid as it

exercising agony. At last all this was got through; he was placed in the new bed in comparative comfort, although the pain continued to increase.

As soon as these arrangements were made Madame Abrazoff, accompanied by Paul, came to visit the patient, and she

might have been had he been an English boy, but still he hurried over the little street, and soon returned, having met the intendant, who had been dispatched by Mr. Abrazoff to the scene of suffering.

After one or two questions put to Tenterton through the instrumentality of Madame Abrazoff, the intendant said,

"I fear that the upper part of the leg is very badly broken. I would rather not have anything to do with moving him before the doctor comes, but he certainly ought to breathe better air than the atmosphere of this wretched hut."

"Then let the men carry him on the bench as he lies to your house; let him have the best room—we can manage; we are not wounded. Do as I bid you."

The intendant was surprised. It was a new experience to the German to see the heads of the house so interested in a "teacher," "only a teacher" being greatly looked down upon by the servants and peasants.

"But," said the intendant, "we cannot move the bench; it is fastened to the wall."

Madame Abrazoff, without raising her voice or changing a muscle of her face, said, calmly, but with a decision against which there was clearly no appeal, "Unfasten it," and left the house.

Nothing exceeds the dexterity with which a Russian peasant uses his axe. So the owner of the hut was called, who in a very few moments had succeeded in detaching the bench from the wooden wall, and in a few more they were all in the cottage belonging to the intendant. Here the little best sitting-room had been converted into a bedroom for the reception of the suffering Englishman.

On endeavouring to undress him and get him to bed his new attendants found the right leg above the knee so swollen that they could not remove his clothes, which had literally to be cut from him, an operation which seemed to occasion

was greatly shocked to see the change which a few hours' suffering had wrought in his appearance.

Mamashinka" (a pet form of mamma), said Paul, "when we were at Berozovo the peasants said that the priest had come to Ozoonovo. Shall I try to find him?"

"It is of no use," said Madame. "The English are raging heretics, and do not believe in the only true and orthodox faith."

"I do not mean to talk religion to him, but they say that the Berozovo priest is a learned man, and knows something of medicine."

"That is a good thought, Pauly, find him out and bring him here. Madame Narishkin has driven home, and I never thought of asking her to look at Mr. Tenterton. She, too, is clever as a doctress, but I have no nerve for such things. Have Petatchock saddled, find out where Simeon Ilitch is, and bring him here directly."

"All right, Mamashinka; I'll find him out somehow." And off flew Paul, really excited and ready to do anything for the suffering man. As he left the room the intendant entered, accompanied by a clever-looking young man in a peasant's dress, who had been a servant in the family, but who preferred agriculture to the constraints of life in Moscow and St. Petersburg. He had travelled with Mr. Abrazoff and knew a little French, in fact quite enough to make himself intelligible. Madame Abrazoff stopped a moment, and addressing this individual, said,

"I want you to be very careful and watchful, Nikieter. This gentleman is a friend of ours, and what you do for him shall be rewarded by a very handsome *na Tchai*" (money for tea, the Russian name for a gratuity), "and Nicolai Alexandrovitch will see you about the house question."

Thus saying, Madame Abrazoff left the cottage and proceeded with her daughter to enter the landau which was awaiting them, and in which they were going off to stay with their friend Madame Narishkin (whose house was twenty versts off), where they were to remain a few days to recover before returning to Moscow, where Abrazoff had a splendid mansion.

Such of her wardrobe, and of the thousand and one indispensables of the toilet, as had been saved from the fire, had been packed in sundry large boxes, portmanteaus, etc., which were all securely placed on a country cart of the better kind, to which three horses had been harnessed abreast. This cart had been sent away beforehand as soon as the articles could be packed up. The precious casket with the priceless diamonds was securely fastened under the seat of her own landau, which formed a kind of locker to receive it. She placed her treasure with her own hands in this receptacle and secured it with a key, which she wore attached to a sort of girdle round her waist. Marie Nicolaevna sat in the back seat of the landau and Madame Abrazoff took her seat beside her daughter. Then the French governess took her seat next to the German, *Fräulein von Drachenhausen*.

Another carriage drove past in which were seated the Russian governess and Madame Abrazoff's French maid Thérèse (between whom a feeling of mutual contempt existed), and in front of them, as gay as larks, sat the Russian maids of Madame Abrazoff and Marie's trim handmaiden Proscovia. This young lady had already enlisted the sympathies of the coachman, who solemnly pledged himself to bring them all to their journey's end in first-rate, prime condition. Off flew the happy *cortège*, quite forgetting in the fun and excitement of the drive the more terrible excitement of the previous evening. And by the time the ladies reached Madame Narishkin's house Madame Abrazoff had forgotten all about her perils, the rescue of the diamonds, and very nearly all about Edward Tenterton.

But we must not do the same, and therefore our story returns to the cottage of the intendant, where we left Tenterton in great agony, attended by Nikieter, who had been watching him most carefully.

At length the sound of horses' hoofs were again audible, and again the village dogs barked in full chorus as Paul rode up on his pretty little Cossack horse, trotting by the side of a telega, or country cart, driven by a peasant in a striped calico shirt, bound round the waist with a piece of string, a pair of wide calico trousers, which had once been blue, and a conical hat with no perceptible rim to it.

This man was driving a wonderful little wiry horse, such as can be met with only in Russia—undersized, underfed, overworked, but as cheerful as the peasant himself. Behind the peasant, on a little heap of sweet hay, sat the priest, attired in a long brown garment of cloth reaching nearly to his feet. This coat was bound round the middle with a broad leathern belt. The sleeves were very wide at the cuffs, hanging down, in fact, quite loosely, and displayed tight inner sleeves of black belonging to an inner garment. On his head he wore a low-crowned, broad-brimmed wideawake of

black felt, below which his long, unshorn hair waved, full and free. He wore a full, long, venerable beard, and presented on the whole a most patriarchal—or rather apostolic—appearance. His hair was dark-brown—nearly black—and seemed well cleaned and kept, his shoes were scrupulously neat and clean—a Russian must indeed be in a state of indifference or utter despair if his shoes and boots be not attended to!

Arrived at the cottage, Paul sprang from his little Cossack horse and helped the "batushka," or "little father," to alight. Servants from the house (that had been) were in attendance to take charge of the horses as the priest and Paul entered the intendant's house. Nikieter received them at the door with beaming smiles, and stated that the patient was asleep. The priest, however, walked into the room in which he lay, and, going up to the little iron beadstead, found that he was really not asleep but in a swoon.

He examined the wound, and found that the limb had swollen fearfully, but his knowledge of medicine was very slight, his acquaintance with surgery still slier. Fortunately, like many Russian priests, he was a modest, humble-minded man, thinking less of himself than of the wants of his flock, and yet not loved by them, for out of their poverty the little that supplied his wants and those of his family had to come.

He looked at that young Englishman lying senseless on the wretched bed before him, and he could not repress a sigh of almost envy as he contrasted the fine handsome countenance and well-cut features, full of refinement—full of *something* which in all the faces he had watched in sickness, misery, and death, had been wanting.

He bade Nikieter bring large buckets of cold water from the well, and tearing up a sheet from a second bed in the room, first introduced a number of the fragments so produced under the suffering limb to keep the water he should bathe it with from spoiling the mattress below. He then saturated other fragments in the ice-cold water and applied them to the leg and to the patient's head. At last this constant application of cold water refreshed the patient and reduced the swelling of the limb. All the evening the priest patiently sat at his task of mercy and soothed the fever of the aching head. At length he resigned his post to Nikieter, who took his turn at nursing. So through the night they relieved each other at their post. The morning brought a change in Tenterton, who really fell into a wholesome sleep, and when he woke he was more able to converse, though still in dreadful pain.

The second day was drawing to a close, and yet no regular medical aid had arrived. The setting sun shot rays of autumnal splendour through the village trees, tinging them green and gold. Countless pigeons flew about the huts, seeking their nests betimes. Dogs, tired with the heat and languor of the day lay down in corners for a snooze. The girls had finished all their harvest work and now were singing the low melancholy chant peculiar to the Russian peasant. There was a soothing drowsiness about the place that seemed perfectly Oriental in its character, perhaps as the result of extreme heat leaving a lassitude in nature hardly conceivable in this snug little island, where, thanks to sea air,

rain, and fogs, we seldom know a summer's heat or winter's cold, the whole year being like a changing autumn day!

But the dogs were soon startled into savage activity, and the peasant boys were recalled from their prowl among the ruins of the "house," and the peasant men were roused into activity by the sound of approaching bells. "The wrangling and the jangling of the bells" (as Poe expresses it) woke up the dormant faculties of quadruped and biped in Oozonovo. To this succeeded the sound of wheels, and, tearing into the village as hard as the high-bred horses could scamper, came the carriage with the doctor and the peasant.

Nikieter was at the door signing to the driver to pull up where he (Nikieter) was standing, because, of course, the peasant having left Tenterton in a hut on the opposite side of the village, he was naturally inclined to take the doctor there, but seeing Nikieter waving his cap, he stopped before the door where he was standing.

"Stop there! All right, doctor. Your patient is within! Get down, you pigs of dogs! will you? Just lash out a bit with your whip, Anton, they want it, and must catch it. All right, doctor, jump down! Just in time. Nicolai Alexandrovitch will be here directly. This way, doctor. Hurrah, *what* a doctor! the young Englishman will be cured by the very sight of you! What illness could stand against *such* a doctor?"

Dr. Strammeller was, indeed, as far as the outward man went, a doctor to feel confidence in. He was six feet six inches high without his shoes, and stout in proportion. He was a Prussian, an army surgeon originally, but in the war with France he had quarrelled with the senior major of the guard regiment in which he served, a duel was the consequence, and the major was dangerously wounded. So the doctor fled to Russia, where his great skill in medicine, coolness as a surgeon, and enormous physical strength, soon placed him at the head of the medical world of Riazan, whither he had gone quite by chance to perform an operation. He spoke little Russian, for he had been but a short time in the country, but he was making rapid progress in his study of the language. When he saw Tenterton lying in the condition we have mentioned, with the priest applying the cold water cure, he went up to the bed, opened it without a word, examined the burns and the more serious affair with the leg, and then said in German,

"That is the best treatment for non-medical people that could have been adopted." Then turning to Nikieter he asked in Russian whether the wounded man were a German.

"No, doctor. That is to say, not quite. He is '*Anglitchan*,'—an Englishman."

"You are a clever fellow," said the doctor, "you are a philologist."

"Indeed, I am nothing of the kind; I am a Christian!" was the indignant reply.

"All right," said the doctor. "Who is this young gentleman?"

"I," said Paul, "am the son of Mr. Abrazoff, in whose house this trouble happened. Would you like to speak German? I understand it, though I speak it very little and very badly."

"Famous!" said Strammeller, heartily, in his own beloved "Deutsch." "What a pleasure it is to speak German! Now to business. Our young friend here is in a bad way. Something must have fallen on him. There is a compound fracture of the thigh-bone of the very worst kind; to move him for weeks to come will be impossible. A carpenter must be sent for to make a special couch for him, on which he must recline and never move. It will be dangerous work to move him from that bed to the couch, but on the bed he cannot be attended to, and besides he must sometimes move or he will perish. On the couch I shall make him this will be unnecessary, and I guarantee his recovery."

"For that assuring speech, doctor," said a new-comer, in very fair German, "you have my best thanks. Do what you like, order what you will; whatever it costs he must be cured, so I give you *carte blanche*."

"It is my father," said Paul.

"And quite the right sort of father to have too, my boy," said Strammeller. "I wish I had had one like him. You may depend upon my exerting my utmost skill for your Anglitchan, as you call him. But it will be weary work for all the rest of you, though of course interesting from a professional point of view to me. And I shall often run over to see him—"

"Oh, no," interrupted Abrazoff.

"Oh, no!" said the doctor, angrily;

"why not? I must—I must see him frequently. I thought just now you would do any mortal thing to pull him through this, and now you seem to hang back."

Abrazoff laughed. "You misunderstand me," said he. "I want you at any cost to remain here with your patient, giving up your other practice, and if you have to lose a practice at Riazan, I will guarantee you one in Moscow. You shall be no loser in the bargain."

"That is a very tempting offer, but we are quite strangers to each other, and I propose that we let things remain as they are for a few days, and then if you are in the same mind you can make me your proposal in writing. Let us now look to the patient."

"Be it so," said Abrazoff. "Whatever you require my intendant will supply. There was a medicine chest full of drugs at the house, but that is burnt with the rest. The only things saved were my wife's jewels, which have cost this young man so dear, part of her wardrobe, my cash-box, which, however, had not much in it, and a deed-box, which contains some valuable securities; all the rest perished."

"Well," said Strammeller, "our present work is to cure this patient, and I see the carpenter has brought the wood. Will you assist me to explain what I want him to make?"

"With pleasure."

Here the entrance of the carpenter cut short the conversation, and he received the orders to make a sort of chair

composed of three flat boards joined at right angles, and so contrived to move in a socket as by adjusting the frame the attendant could alter the position of the patient from sitting to lying without his (the patient) having to move a muscle.

Abrazoff was delighted with the invention, and told Strammeller that he ought to take out a patent for it, as it would be invaluable in war as a litter and couch combined.

The doctor laughed, and said, "No, thank you; I have burnt my fingers already that way. I shall employ it where I can for the good of humanity. It is the only thing for the fracture of the femoral bone, as in this case. There is a rib broken too, but that is nothing; the real danger is the thigh-bone. I suppose I can have plenty of lemons here?"

"I think there are plenty. There were lots sent in, I know, but whether they are burnt or not I cannot tell. Nikieter, run and ask whether there are any left in the outhouses or whether they all went up to the house."

Away went Nikieter, and as we cannot do anything to help our poor countryman we will leave him too in the hands of Dr. Strammeller, and pay a visit to Moscow, for the exigencies of our tale and the plan of its construction will not permit of our continuing in one unbroken, even line, and now we must follow the fortunes of our hero—Ivan Dobroff.

(To be continued.)

ASIATIC EXPLORERS.

THE RIVER OF GOLDEN SAND.

escape of Vambéry from recognition by the Russian sailors at Ashourada—when on his way to Gomushtep and Samar-kand—will be in the recollection of our readers. It was to the same port on the Caspian

that Captain William Gill and Colonel Baker came from petroleum-soaked Baku on their way to explore the border and frontier by-ways of the land of the Shah.

Crossing the Elburz Mountains by a pass 12,000 feet above sea level, and skirting Mount Demavend, they entered the dense

forests of Mazanderan, and through these by way of Damghan followed the road along the northern boundary of the desert of Khorasan. After a visit to Meshed they went on to Kilat, perhaps the most naturally impregnable fortress in the world. It is a valley surrounded by mountains with precipitous sides towering up from two to three hundred feet from the plain. Into it are but five entrances, and these are narrow gorges cut vertically through the cliffs and only a couple of yards in width. The valley is fertile and under cultivation, and the difficulty of provisioning it in time of war is solved by the springs that rise in its centre, the stream that flows through, and the flocks and herds that graze on its extensive meadows. From Kilat the Kurdish colony of Darakgaz was visited, and then the travellers proceeded over the Kurendagh, explored the upper streams of the Attrek, and then bearing south-west went on to Jahjirm, Shahrud, and Teheran.

This was Captain Gill's first trip. His next was on the other side of the Asiatic continent, and was undertaken as a preliminary to the great journey of his life—his explora-

tion of "the river of golden sand." This first Chinese trip took place in 1876. In his pleasant book he tells us how he was struck with the vehicles of Shanghai, where the growler is replaced by the wheelbarrow and the hansom by the jinnyrickshaw. This vehicle of many spellings is a curious man-cart drawn by a coolie, who runs along in the shafts followed behind by a companion, with whom the pulling is taken in turns.

We have his jinnyrickshaw experience of the lynch-pin coming out and the wheel slipping off, and the Chinaman ingeniously tying it on again with a hair out of his pigtail. Talking of pigtails—that badge of servitude inflicted on the Chinese by their Manchu conquerors, and now retained as an honour—we have the story of the Chinese gentleman riding in a jinnyrickshaw and accidentally letting his pigtail slip overboard. It caught in the wheel near the centre and the unfortunate possessor was gradually wound out of his seat. He shouted, but in vain, for the "horse" took it as a hint to go faster, and the man behind was horror-struck. An English sailor passing along saw the diffi-

culty at a glance, and with one slash with his knife cut off the pigtail and freed its possessor. But that sailor had to flee for his life, and his ship had to steam away in double-quick time, for the whole neighbourhood was up at the insult unwittingly offered by the seaman to the almond-eyed gentleman in difficulties.

Curious, too, did he find the currency of Peking and Northern China, where "lumps of silver" take the place of coins. Ingots had to be carried about by the travellers, and an adjournment had occasionally to be made to the village blacksmith to cut off a lump or two to serve as small change, every tiny

He ascended the Yangtze to Chung Ching with Mr. E. C. Baber, and then travelled on to Cheng-tu, the capital of Szechuen. From Cheng-tu he made a loop up into the Min Mountains, and was the first to become acquainted with those curious highlanders, the Mantzu and the Sifan, who are supposed to be the descendants of the ancient people whom the Chinese conquered. For the Chinese, ancient as they are, were not the first race to inhabit Eastern Asia. Just as the Britons of old, when they crossed from the mainland, found a race in possession that they had to subdue, so did the Chinese, on arriving probably from the plains of the

Captain Gill.

lump having to be weighed to ascertain its value. From Peking, which is fast becoming civilised—and even imports its wood for fuel from America—Captain Gill went northwards to the Great Wall, described by him as consisting, for seven or eight feet, of granite blocks, and, for the rest of the height, of fifty-five courses of four-inch bricks. Then he went on round the Gulf of Pechelée. In this part of Northern China, away from the tea districts, the local drink is not tea, but plain hot water—not cold, for to cold water administered internally or externally the natives entertain a peculiar aversion. Rice, too, generally supposed to be the universal food of the Chinese, is here replaced by maize and oats. We wish we had space to quote the cheery narrative of this pleasant trial trip, with its shrewd observations on the peculiarities of the men and the animals, not forgetting the malpractices of the bay horse Tom Bowling, so named "because his virtues were so rare"!

In 1877 Gill started on his exploration of the Chin-Sha-Chiang—the "river of golden sand." This was one of the most careful pieces of work yet done. Nothing that he did not see did Gill put on his map, and his route shows none of the pleasant streams meandering away to the right and left in gay profusion, such as are frequently met with in travellers' books. There is the route surveyed as an engineer would survey it, accurate and trustworthy in every particular. And the route was a long and adventurous one. Gill had intended to go from Cheng-tu across Kashgaria and come out in Europe, but news from home as to the chance of war with Russia made him turn off to the south and make his way out through Burmah.

Caspian, have to conquer the nation that had preceded them. These highlanders differ much from the Chinese in their character, and are lacking in that peculiar thrift which distinguishes the Celestial—a thrift due most probably to the fact that owing to the natural poverty of the soil the utilisation of waste products has had to be carried to excess, and the wants of the people reduced to a minimum, for the race to be kept alive. At least, this was Captain Gill's opinion. He it was also who first pointed out that the chief reason of China's stagnation is the sifting out all the talent by means of examination into the service of the State and leaving only the mediocre and the ignorant to indulge in private enterprise. From the Min Mountains Captain Gill brought away an old manuscript, written in a character older than the ancient ideographic system of the Chinese, but probably connected with it in very remote times, and which is thus one of the oldest written records that we have.

On returning to Cheng-tu the anticipated exploration of Central Asia from the east had to be abandoned, and the route was taken for Tibet and the Irawadi. Up into the tableland, into that strange country of Eastern Tibet, with its prayer-drums and votive offerings of pieces of coloured cloth on the bushes, as in Persia and Afghanistan, went the little exploring party, much to the surprise of the still queerer people who loll out their tongues as their most cordial salute and shoe their horses only on their hind feet. Many were the difficulties to be overcome and great was the tact required to make good the passage, but the expedition kept on through Litang, and thence reached Talifu,

Marco Polo's Carajan. From Talifu the road was taken to Bhamo, where the long journey of nearly three thousand miles was ended.

There is much humour in Captain Gill's description of the wonder of the Chinese at the whole affair. Why such a traveller with such instruments should come amongst them was a mystery, and all the proceedings, from early morn to dewy eve, were watched with the greatest interest. The poor photographer once ventured on an explanation of the camera. He was met by the reply, "A man, or a dog, or a horse cannot see without eyes; how, then, can that machine? It has not got eyes of its own, it must therefore have the eyes of somebody else, and so—get off!" and the photographer had to do so at a run amid a shower of bricks and stones. The remarks on the personal appearance of the explorers were not always uncomplimentary. For instance, Captain Gill was once described as "having a nose big enough for him to be an official," the popular opinion being that the size of the nose varies in direct proportion with the ability to pass competitive examinations.

Gill was soon at work again, and after visits to Turkey and to Afghanistan, he was sent with Professor Palmer—the famous Oriental linguist, well known to us all in connection with the exploration of Palestine—on that mysterious expedition to the sheikhs of the Sinai desert, in which all three met their death. They started from the Wells of Moses on August 8th, 1882, and were surrounded by Arabs during the dark night of the 10th. They fired their revolvers and kept the enemy at bay in the darkness, but when the morning dawned, and the Bedouins saw how few they were, they simply walked up and secured them. They were taken to a wild, romantic place, with precipices shelving down into Wady Sudr, and inaccessible for camels from the road above where the party was attacked. Below the precipices was a narrow gully forty-seven feet deep, and about twenty wide, and into this they were given the choice of jumping if they cared not to be shot. Palmer jumped, and so did Gill; Charrington, the dragoman, and the cook, who formed the rest of the expedition, were shot.

Gill was born at Bangalore, and thus he began and ended his life on the continent whose every chief country he knew so well. He had been educated at Brighton College, and in the chapel there is a memorial tablet whose inscription aptly summarises his character and career. It reads as follows:—

"This is erected to the memory of Captain William John Gill, a pupil here from 1856 to 1861. He entered the Royal Engineers in 1864. An adventurous journey in Northern Persia, 1873, developed his capacity for exploration. Some years later he undertook an expedition to China, with the view of penetrating its western frontier by routes not before traversed, and succeeded in making his way through Eastern Tibet to Talifu, and thence in the footsteps of his school-fellow, Augustus Raymond Margary, to Bhamo, on the Irawadi river. Being attached to the Intelligence Department of the War Office, he made several hazardous journeys to collect valuable information for the public service. In 1882, during the British intervention in Egypt, he was dispatched by Government on special duty to the Suez Canal, and having proceeded into the Desert of Sinai, in company with Professor E. H. Palmer and Lieutenant H. Charrington, R.N., the three were captured by an overpowering force of Bedouins and murdered on August 11th, 1882. His remains, with those of his companions, were interred in the crypt of St. Paul's Cathedral on April 6th, 1883, where a memorial tablet has been placed by their country in commemoration of their services and untimely deaths. He was a good friend, a good soldier, and a most enterprising and accomplished traveller."

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XIV.

THOUGH autumn was far from its end according to the almanacks, the keen wind and chilly mists of the last days in favourite game to join the "football-ers." There was a grand match to be played such had his work cut out. He knew well enough that he ought to have resigned in view of his coming exam, but

"Walked past the Doctor and Mrs. Fellowes."

October showed that summer, at all events, was long past. Cricket had gone to the wall once more, fives was the only rival of football, and lately even the devotees of fives had forsaken their

in a week, the town against the school, and every boy in the place, whether he was going to play or not, thought of scarcely anything but the coming contest.

Lang was captain of the team, and as

he had not the heart to do it. He believed his chance of passing was nil, so he thought he might just as well enjoy himself and let the matriculation get on as best it could

Soady was in the team too, his weight telling in scrimmages. But Soady meant business, and refused to practise except between morning school and dinner, three-quarters of an hour a day. Probably this moderate exercise helped instead of retarded his mental powers; at any rate he was getting on with his work in superior style.

"Think we shall lick 'em, Soady?" inquired Tommy, as they went in to get ready for dinner.

"Don't know, Tommy; you see we haven't got you in the team yet."

Tommy grinned, but made a mental note of the sarcasm. He revenged himself for it on the Saturday afternoon when the first and second fifteens played the school. He and Featherstone took Soady in hand and did nothing but follow him about, get in his way, and generally spoil his play. Soady felt like a horse tormented with flies, for though he tumbled them over about six times a minute, one or the other was up again and on him "like a knife," making life a burden.

"Think you'll lick 'em, Soady?" grinned Tommy, when the game was over, and the two teams had won by three goals to two.

Soady looked doubtful whether he should maintain his dignity and knock the youngsters' heads together or confess he had been paid out fairly. He did the latter, and stood them both a bottle of ginger-beer. Not only that, but he stood them a couple of bottles each just before the return match on the following Wednesday afternoon, the consequence of which was (as he had foreseen) that the youngsters lost their wind after the first five minutes and were of no use the rest of the afternoon.

The day of the match came, and Lang felt of more importance than usual. The match was played in the town fields, about a mile from the school. Lang was on the ground before the rest of the team to make the final arrangements. As he strolled up to the tent he saw some one standing there whom he recognised at the first glance.

"Hullo, Fanshawe! what on earth brings you here?"

"Lang! by all that's lucky; there isn't a fellow in the school I'd sooner have seen."

They shook hands, though Lang was not anxious to do so. He knew quite well that the less he saw of his old friend the better. But they had parted on very good terms, and it would be uncivil to cut him now.

Add to this that Fanshawe was a swell at football, and used to be captain, so it would have been in the last degree ungracious for Lang to have given him the cold shoulder.

"I heard the match was on," said Fanshawe, "and as I had to come to Melchester on business this morning, I thought I'd just step over and see it. I wanted to have a look at some of you fellows as well. Where's Melhuish? Is he in the team this year?"

"Melhuish has run away," said Lang.

"Run away?" cried Fanshawe, with a low whistle. "When was that?"

"Oh, a week or two ago."

Fanshawe looked as black as thunder. "Do you know where he is?" he asked.

"Yes, in London."

"Whereabouts?"

"I don't know."

"Then what's the good of telling me he's in London? I might as well look for a needle in a bottle of hay."

"What do you want to see him for?"

"He's an old chum," explained Fanshawe; "besides, he owes me some money," he added, ingenuously, "and a little money would be uncommonly welcome just now."

Lang did not take the hint; in fact, he seized the excuse of the entry of his team to get away from Fanshawe. He would not care to be seen by his side if the Doctor came down to witness the match.

Fanshawe evidently did not intend to leave just yet, for he strolled tranquilly about with a pipe in his mouth, occasionally stopping for a few minutes' chat with some one of the team.

He did not look quite a desirable companion. He was a tall, fine-looking young fellow, but his eyes were watery and his skin out of order. He looked as if he drank too much and smoked too much, as in fact he did. Then his clothes, though of good cut, were not so clean as they might have been, and his gaiters wanted brushing. His hat had lost its first gloss, though it had the fashionable curl and was cocked rakishly on the side of his head.

"Who's that?" whispered Tommy to Featherstone, as they wandered about outside the flags.

"That's Fanshawe, of course," said his companion, though why "of course" he did not explain. "He's smoking! Here's a go; here comes the Doctor!"

Featherstone rubbed his hands in glee; he could not divest himself of the idea that the Doctor must have some authority over his former pupil, and that he would never allow him to go on smoking. To the small boy's disappointment, the Doctor took no notice whatever of Fanshawe, but walked about with Mrs. Fellowes as if unconscious of his presence.

However, Fanshawe did not mean to be ignored, so he ostentatiously walked past the Doctor, and, looking straight at him, passed on without even touching his hat. The Doctor was unmoved by his rudeness, but some of the small boys felt a sort of creeping sensation, and wondered to see Fanshawe still survive.

The match was a keen one, so closely contested that Fanshawe had considerable difficulty in making up his mind on which side to bet. He decided at last to back the school team, the members of which from practice every day were in better staying condition than the town, which only met twice a week. Having managed to secure several takers at the small odds he offered, he proceeded to do his best to make his money secure by informing Lang, during an interval, of a change in the tactics of the town, which he had overheard being discussed. Thanks to this timely information, which took the form of advice only, the school team were the victors by two goals and a try to one goal.

The Doctor left the field after the school had won their first goal, so now there was no one to check Fanshawe. For the next half-hour he was the observed of all observers. He talked loudly and bigly; the small boys wondered and some of the older ones envied. To be one's own master, to laugh at the Doctor, to be able to smoke without fear of punishment, not to have to go in by half-past five—these seemed enormous privileges.

And all these were to be obtained by the simple process of leaving school!

"I say, Lang," said Fanshawe to him when the match was over and his bets were collected, "you must come down town and have an hour or two with me."

"Can't; it's getting on for five, and they shut gates at half-past, as you ought to know."

"Yes, I know well enough, but those old gates didn't always manage to keep me in. Can't you cut preparation and have a spin with me, or something of the sort?"

"I might get leave," said Lang, hesitatingly. That sealed the matter.

"Of course you can. If you can't, take French leave. Meet me at the Crown about seven; you'll be back then before prayers."

Lang promised to come. He knew Mr. Pickering would be in charge that evening. Now, Mr. Pickering never played football nor came to watch it; the classics engrossed his attention too much. He would know nothing of Fanshawe's visit. Lang resolved to boldly ask him if he might spend the evening out, as a friend of his was paying a visit to the town.

It fell out as he had anticipated. No objection was raised if he would promise to be back before prayers.

Fanshawe was waiting for him. As if it were a pre-arranged thing, he led the way to the billiard-room.

"Have a smoke?" he asked, holding out his cigar-case.

"I don't mind trying a cigarette," said Lang.

"All right; I'll have a pipe if you don't mind. What do you say to a game?"

"All right; I don't play much, you know."

"Oh, I'll give you points, of course."

He gave Lang a good start. The game ran on fairly evenly, but when eighty was reached Fanshawe was only three behind. However, he won by seven only, and as he congratulated Lang on his skill and assured him that with very little more practice he would play a first-rate game, Lang seemed flattered, and paid cheerfully the small amount he had lost. He was fairly in Fanshawe's hands now.

However, he declined to play another, and Fanshawe did not press him. They lolled along the benches to finish their smoke.

"How are things going this half?" asked Fanshawe.

"Oh, I don't know, and don't much care."

"No, I suppose not, as you're going to leave at Christmas. What are you going in for then?"

"Pater wants me to be a solicitor."

"Ah! you're going to follow in my footsteps. Well, it's a very decent profession, but I wish it brought in a little more cash during the first year or so."

"You like it?" inquired Lang.

"Oh, yes, it suits me very well. You see, I've an easy-going boss, so I do pretty much as I like. It wouldn't suit me if I had to stick at my desk all day. As it is, I've bother enough getting ready for my exams."

"Haven't you finished yet?"

"Bless you, no; hardly begun."

"Are they hard?" asked Lang, anxiously.

"Pretty fair, but I don't mind that."

"You passed matric in first division and saved a year's articles, didn't you?"

"I passed in honours," replied Fanshawe, "and you'd better do the same."

"Wish I could, but I've no more chance of passing than of becoming Lord Chancellor."

"Oh, stuff! it's easy enough."

"Yes, to a clever fellow like you," responded Lang, dolorously. "My pater is as hot as possible about my going in, and there'll be the mischief of a row when he finds I am plucked, as I shall be as sure as a gun."

Fanshawe laughed.

"Bosh! you can get through easy enough."

"I wish I knew how."

"Get some fellow to pass for you," said Fanshawe, with another laugh. "I'll do it for you cheap if you like."

"I wish you would," replied Lang, in the same unhopeful tone as he would have used if he had been wishing for the moon.

"I will," replied Fanshawe, almost eagerly; "that is, of course, if you can make it worth my while."

"What do you mean?"

"What I say. I know the subjects backwards. I can get up the classic translations in a couple of days with a crib; the rest of the exam is the same every time."

"But won't they know your name?"

"You duffer! I shall pass under yours. You send in your application and all that, and I shall attend in your place, that's all. It's as easy as A B C."

Lang was silent. The offer had come so unexpectedly; he had not yet collected his thoughts. The temptation was a strong one.

"Of course," went on his companion, "I can't do it for nothing. What money will you have when you go up to town?"

"Pater let my brother have £10 a month when he first went up."

"Little enough too. Now, if I say I'll pass for you for £10 you can't say I'm swindling you. You see, if you don't pass you'll be thrown back six months, that's £60 allowance more out of your dad's pocket. I wouldn't offer to do it so cheap if I weren't so plagued hard up, and if that sweep Melhuish hadn't hooked it without paying up. Ten pounds! Why I ought to say fifty pounds."

"I wouldn't be much good saying fifty; I don't quite see where your ten are coming from."

"Oh, you can save it out of your allowance. I shan't want it all at once. A fiver when the news comes that you've passed, and the rest as you can manage it. What do you say?"

"You're quite sure we shan't be found out?"

"Of course not. Do you think they photograph every one who goes up, or keep a register of their handwritings for comparison?"

That Lang was yielding was shown by his question. He had ceased to struggle against the temptation, and had even passed the stage of considering the right or wrong of the affair. The point now was, could it be managed in safety?

Before they parted that evening it was all arranged. Lang was to act as if he were going into the exam, but on the days it was being held he was to absent himself. He knew no one else going up, so it was not possible his absence from the exam-room would be noticed.

As to Fanshawe, he thought he was lucky to have hit on Lang. Ten pounds was not much, but it was more than he expected to squeeze out of him, and at all events that fiver would be very useful after Christmas. As to the exam, he did not trouble a bit. He was well up in everything, fresh from having passed it high in honours in the previous June.

"Good night, old man," were his last words to Lang; "you know my address."

"Yes, thanks. You'll be sure not to say a word to any one?"

"Is it likely?" asked Fanshawe, and he was gone.

(To be continued.)

THE STAR OF THE SETTLEMENT.*

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER VIII.—THE GREAT EXPERIMENT.

IN the course of his brilliant researches into the solubility in gas of the solid bodies which had occupied him during the previous year, Cyprien had necessarily remarked that certain substances, silica and alumina for instance, although insoluble in water, are dissolved by watery vapour at high temperature under high pressure.

It was owing to this that his first idea was to find a gaseous solvent for carbon with a view to subsequent crystallisation. But all his efforts in that direction were fruitless, and after many weeks of failure he resolved to change his batteries. Batteries is an appropriate word, for, as we shall see, the cannon had a good deal to do with the attack.

Several circumstances led the young engineer to think that the diamonds might be formed in the kopjes in the same way as sulphur in solfataras. For, as is well known, the sulphur there results from a partial oxydation of sulphuretted hydrogen, some of it being changed into sulphurous acid, while the rest is deposited in crystals on the sides of the solfatara.

"Perhaps," said Cyprien, "these diamond deposits are really carbonataras. If a lot of hydrogen and carbon hung about the streams and alluvial deposits in the form of marsh gas, why should there not have been an oxydation of the

hydrogen with an accompanying partial oxydation of the carbon, such as would bring about a crystallisation of the carbon in excess?"

With this idea to begin with, a chemist had little difficulty in selecting a compound to play the part of the oxygen in an analogous but artificial reaction, and Cyprien immediately entered on the investigation.

In the first place a state of things had to be devised experimentally to resemble as much as possible the supposed conditions under which the natural diamond was produced. This was simple enough. Everything great in science and art is simple. What can be less complicated than the greatest discoveries of humanity—gravitation, the compass, the printing-press, the steam-engine, the electric telegraph?

Cyprien went himself down to the lowest depths of the diggings and there selected samples of the earth which he thought best suited for his experiment. With it he made a thick pasty mortar, and with this he carefully lined a steel tube about half a yard long, two inches thick, and three inches in bore.

This tube was simply a piece of cannon condemned as unfit for service. He had managed to buy it at Kimberley from a company of volunteers who had been disbanded after a campaign against the neighbouring Kaffirs. This cannon, sawn in segments in old Vandergraart's workshop, gave the very instrument that was required—namely, a chamber of sufficient resistance to support enormous internal pressure.

After firmly closing one end of the tube, he placed in it a few fragments of copper and about three pints of water. Then he filled it with marsh gas, and then carefully luting it with his mortar he drove stoppers into each end and fastened them in strongly enough to withstand any force.

Thus was the apparatus constructed. The next thing to do was to submit it to intense heat.

To obtain this it was put into a large reverberating furnace kept going night and day for a fortnight, so as to give a constant white heat.

Both the furnace and the tube were then enveloped in a thick coating of refractory earth, so as to retain the greatest possible quantity of heat, and to cool down as slowly as possible when the time came. The furnace looked like a huge beehive or an Eskimo hut.

And now Mataka was able to be of use. All the preparations had been watched by him with great attention, and when he found that they were going to try and make a diamond his interest in the experiment became intense. He soon learnt how to stoke the furnace, and the charge of that department was entrusted to him.

As can be imagined, these arrangements took some time. In a European laboratory the experiment would have been begun within a couple of hours of its having been planned out, but in this half-civilised place it took three weeks before all was ready. And Cyprien was very lucky in several things; for in-

* We have just been informed that the title selected by M. Verne for his story, "The Star of the South," had been anticipated by a book already published. To prevent the remotest chance of confusion, we at once change our title, as above.

stance, in finding the old gun, which just suited him, and in procuring coal for fuel. In fact, so rare was coal at Kimberley that he had to apply to three merchants to scrape together a single ton.

At length all difficulties were surmounted, and once the fire was lighted, Mataki took it in charge.

The young Kaffir was very proud of

take part—could not but contribute to his prestige.

Cyprien often smiled at the solemn airs the black gave himself in performing this humble task of stoker and preparer, in putting on the coal and poking the fire, or dusting the rows of crucibles and test tubes. And in this gravity there was something even pathetic—that artless expression of the awe inspired by

he washed and got-up Cyprien's linen; on Mataki's part by the rigid punctuality with which he carried out all his master's instructions.

But sometimes the two friends went a little further in their endeavour to gratify their "pa." Occasionally, for instance, Cyprien would find on his table certain fruits or dainties that he had never ordered, and which never appeared in the tradesmen's bills. Now and then when his shirts returned from the wash they would be provided with gold studs of mysterious origin. An excellent easy-chair appeared amongst the furniture; an embroidered cushion, a panther-skin, and several costly knickknacks came into the hut none knew whence.

And if Cyprien asked Li or Mataki about them, all he could get were evasive responses, such as, "It wasn't me, sir!" "I wonder who did it!" etc., etc.

Cyprien would have taken little notice of these things had he not suspected that the gifts had been very easily acquired. Had they cost more than the trouble of taking them? Nothing, however, happened to confirm his suspicions, and all his inquiries produced no result, while behind his back Li and Mataki exchanged sly looks, significant smiles, and cabalistic signs that seemed to afford them intense gratification.

Cyprien had, however, other cares to attend to. John Watkins seemed to have made up his mind to get Alice married as soon as possible, and with this in view seemed to keep open quite a museum of probable admirers. Not only was James Hilton there every evening, but all the bachelor diggers whose success in the kopje had in Watkins's eyes given them the necessary qualifications for his son-in-law. The German Friedel and the Italian Pantalacci were amongst them, both having been among the lucky ones of the mine. Friedel was more pedantic and peremptory than ever; Pantalacci had blossomed out into a colonial swell, resplendent with gold chains and diamond pins. He wore a white linen suit, which made his yellow complexion look still yellower and more cadaverous.

With his buffooneries, his Neapolitan songs, and his attempts at being a fine gentleman, Pantalacci tried in vain to please Alice, who despised him heartily for the very obvious motive that brought him to the farm. She never listened to him if she could help it, and never gave the faintest smile either at his jokes or his attitudes.

And Cyprien was at work both night and day on other experiments which he intended to try should he fail in his first attempt at diamond-making. He was not content with theory and formula, though with them for hours he would fill notebook after notebook. Frequently did he visit the kopje, to bring home fresh specimens of the gravels and sands and submit them to a searching analysis, which, repeated in many ways, allowed of no margin for error. The greater the danger became of losing Alice Watkins, the more was he resolved to omit nothing that might give him the victory. And yet, so little confidence had he in himself that he whispered not a word to her of the experiment in progress. All Alice knew was that he had gone back to his chemistry—and she was very glad to hear it.

(To be continued.)

"The young Kaffir was very proud of his functions."

his functions. They were not quite novel to him, as once or twice in his native land he had assisted at a more or less diabolical act of cookery. For amongst his fellows it seemed that Mataki had the reputation of being a magician. A few secrets of elementary surgery, and two or three mesmeric passes learnt from his father, were his whole stock in trade. But the Kaffirs came to consult him for all their ailments, real or imaginary, for the interpretation of their dreams and the settlement of their disputes. Mataki was never at fault, and had always some formula ready, some portent to explain, or some sentence to pronounce. The formulae were generally strange and the sentences preposterous, but his countrymen were satisfied. And what more would you have?

Besides, the flasks and retorts by which he was surrounded in Cyprien's laboratory—to say nothing of the mysterious operations in which he was allowed to

science in a nature degraded, but intelligent and greedy to learn.

But Mataki had his play hours like other men, especially when he was in the company of Li. A firm friendship had sprung up between these two, different as they were in their origin, during the now very frequent visits that the Chinaman paid to Watkins Farm. They had both been rescued by Cyprien from imminent death, and regarded him with the warmest gratitude. It was thus very natural that they should be first drawn towards each other by a sincere sympathy, and then that this sympathy should be changed into affection.

Amongst themselves Li and Mataki had given the young engineer a familiar name that well expressed the nature of the sentiment with which they regarded him. They called him "Pa," and never spoke of him except in terms of admiration and devotion.

On Li's part this devotion showed itself in the scrupulous attention with which

Studies from Nature.—Leopards at Home.

PETLAND REVISITED.

THOSE of our readers who have not yet read the Rev. J. G. Wood's biography of his cat, Pret, will find it republished in the recently-issued book, by Longmans and Co., which bears the title that heads this article. As a study of feline nature the little history is still unsurpassed. More especially is it enjoyable by those who are interested in Pussies and appreciate their affectionate ways.

Never was cat so fortunate before. From his birth to his tragic death, when the rats formed a combination against him and killed him with over thirty bites from their chisel-edged teeth, we have the complete chronicle of Pret's acts and deeds. We trace him from house to house during the many moves, and cannot help sympathising with him under his many afflictions. Pret was by no means a bad sort of a fellow. "When he was a few months old he began to scrape acquaintance with other cats, and used to meet them in the back yard, which by common consent both of cats and householders seemed to be the feline club-house of the neighbourhood. Now, it was very well for Pret to be social in his habits, but when he took to hospitality the consequences became serious. It is true that he never allowed strange cats, no matter how big they might be, to enter the house; but then he was fond of entertaining his friends in the yard, and was in the habit of bringing his own dinner to the club for the benefit of his acquaintances, and then wanting a second dinner on his own account in

the evening. He even went so far as to be disgusted with the meals furnished to a neighbouring cat, thinking that cat's-meat was not fit for feline consumption. Acting on this supposition, he was seen to take away the cat's-meat as soon as it was brought by the itinerant purveyor, to carry it into the cellar, bury it under a heap of small coal, and to take his own dinner upstairs for his friend." His generosity at last grew alarming, and had to be stopped, as it led him to rob the larder, his manifold devices for doing so being frustrated one after another. His last effort did credit to his ingenuity. "In vain did we keep the doors shut and the windows fastened so as to admit air but to exclude any animal larger than a mouse, for Pret always managed to enter the forbidden precincts whenever he chose. At last we found out that he achieved the feat by hiding under the servant's dress and stealthily creeping in when she had occasion to visit the larder. His exit was made in a similar manner."

Pret's method of executing the mice did also credit to his ingenuity. "When he had pounced on some unhappy mouse and enjoyed his usual game of pretending to be asleep, letting it run almost out of reach, and then stretching out a paw and drawing it back again, he proceeded to the next act of the drama. Taking the unfortunate victim by the tip of its tail, he used to convey it to the top of the house, and when he had got to the

uppermost landing he would push his head between the banisters and deliberately drop the mouse through the well, cocking his ears forward to catch the sound of the fall. As soon as he heard the thump of the mouse's body against the hall floor he would cry 'Wow!' in a very triumphant tone, and dart downstairs with his tail erect to recover his prey. He would then pick it up, canter upstairs, and repeat the process till he was tired. His next proceeding was to take his prey and bring it to me, and he was never satisfied till I had taken the mouse out of his mouth, stroked and admired it, and praised him for his achievement."

Pret was very sensitive to praise, and liked it much. Blame or scandal he could not stand. "When he is very comfortable the black tip of his tail lies on the ground coiled up like a watch-spring. In this way he will lie when dozing, and if I speak to him he just straightens the tip of his tail and coils it up again as an acknowledgment of the call and a hint that he is very sleepy and does not want to be disturbed. If, however, we begin to talk about him, and especially if we mention him in a disparaging manner, the tail becomes more and more uneasy, is straightened, and jerked indignantly from side to side. At last his patience refuses to hold out, and he rises to his feet, looks around with an air of injured dignity, walks to the door, and requests to be let out."

The deeds of other cats are also lovingly

told in Petland. We learn, for instance, how Tiny and Brownie helped each other. "The kitten, however, grew so fast, and became so heavy, that Tiny—who, as her name implies, was a small cat—was hardly able to carry it up the stairs, even though she got on the stair above it and hauled it up by its neck. Again she went to Brownie and had a long talk with him. They went together to the kitten, which Brownie picked up. She then walked upstairs with her tail very upright, while Brownie followed her, carrying the kitten just as a nurse carries the baby behind her mistress."

And we meet with a still more noteworthy peculiarity in Thomas Henry. "We had a cat who used to come up, wake us every morning regularly, and then get into bed. At that time I also possessed a very pretty small tortoise called Mary Ann. Thomas Henry was devoted to her. They used to drink milk out of the same saucer, and when they had finished Thomas Henry would lick the milk off Mary Ann's head and neck, and tidy her up generally. She was so used to the process that she only used to blink her eyes, and did not even trouble herself to draw in her head. When evening came, and Mary Ann was too sleepy to toddle about with him, he used to have a game of his own invention. He used to pick up Mary Ann in his arms and see how far he could run on his hind legs before letting her fall. I have often seen him run six or seven yards before letting her down. This absurd game always went on in a passage with an oilcloth floor, so that the quick, scurrying footsteps could be heard at some distance, and every tumble made a great bang."

Of dog stories we have also a goodly batch. The scapegrace Roughie again comes before the world, but some of the others are new friends. Of the dog's power of finding his way we have the following remarkable instance. "A collie was sent from Inverkeithing, on the Frith of Forth, to Calcutta. The sender received a letter acknowledging the receipt of the dog, but adding the information that the animal had run away and was lost. A few weeks afterwards he was astonished at the arrival of the collie, who was mad with joy at finding his master. On inquiry, it was found that he had taken ship at Calcutta for Dundee, and thence had come to Inverkeithing by a collier." This is a very extraordinary case. A more pathetic one is that of the Scotch terrier Medore. The owner, a drawing-master, "was obliged to leave Paris for a time, and, not being able to take the dog with him, left it in charge of a friend. By some curious chance the friend was called suddenly to St. Petersburg, and, not knowing what to do with the little creature, took it with him. Both man and dog reached St. Petersburg safely, but shortly after their arrival the dog was lost. About the end of May, some months after the letter had been received, the drawing-master came as usual to give his lesson. He seemed in great grief, and in broken accents asked to be excused from giving the lesson as he was quite incapable of it. "My poor little dog! my poor little dog!" was all that he could say. At last he told the story. For some time a miserable, half-starved dog, covered with scars and bruises, had persisted in scraping at his door, and the servant, being annoyed by its persistence, kicked the dog downstairs repeatedly. But as soon as it recovered from its fall it returned to the door and renewed the scratching. Whenever the master entered or left the house the dog kept jumping upon him and trying in every way to attract his attention. At last an idea flashed across his mind. Could this disreputable-looking animal be by any possible chance the dog which had been lost at St. Petersburg? He fixed his eyes upon it, and said, "Medore!" The dog gave a piercing cry and fell at his feet. He picked it up, carried it into the house, and laid it gently on the sofa. But Medore was dead!"

That dogs gain information from others of their own kind, and converse in a manner perfectly intelligible to themselves, is undeniable, and well known to every one accustomed to watch their habits. Of this faculty of conversation many instances are given, to which we beg to add the following as being of recent occurrence, and not having before appeared in type. A gentleman who had a couple of fox-terriers sent one of their pups to a farmhouse, about three miles away, to be properly trained. At the farmhouse was a disagreeable old cat, who took a great dislike to the puppy, and made his life a misery for him. In fact, her cruelty called for constant interference. After a time the dog was sent home, guaranteed to behave himself with all due decorum, and the cat was delighted at his departure. Her happiness was shortlived. Somehow or other the puppy must have told his father the way he had been bullied about by puss, for on the morning after his return the old dog and the youngster were observed, side by side, trotting down the road to the farm, evidently bent on business. They reached the farmhouse, and the pup led the way to the cat. The father instantly dashed on to her and killed her with a grip. And then, side by side, the two dogs came trotting home, seemingly well satisfied at the result of their expedition.

Unconventional pets receive a fair share of Mr. Wood's attention. The chameleon—that curious reptile considered by Weissenborn to be so destitute of the power of concentration that for all practical purposes it consists of two animals glued together, each half wishing to go its own way—is described at much length, and, indeed, an individual that can be awake on its right side and asleep on its left, and changes different colours on different sides, is not to be lightly passed over, unsatisfactory pet though it be.

The Coati-Mondi, with its partiality for perfumes sweet and otherwise, also puts in an appearance, and we have an illustration showing Kiko's exquisite bliss at finding a scented pocket-handkerchief, which is quite a masterpiece of animal draughtmanship. The hedgehog and the ferret are passed in review, and the monkey claims its niche. But we may as well tell how the monkey interested himself in the household arrangements. "One day he watched my cook while she was preparing some partridges for dinner, and probably considered that all birds ought to be treated in the same manner. For he contrived to make his way into the yard where his mistress kept a few bantams which she especially cherished. After robbing the nests of the eggs, he managed to capture one of the poor hens, with which he proceeded to the kitchen and then commenced plucking it. The noise which the unfortunate bird made brought some of the servants to the rescue; but they found the poor bantam bleeding, and altogether in such a pitiful condition that in mercy it was at once killed. After this outrageous act Mr. Monkey was chained up. Such ungrateful treatment after all his exertions in the cooking line broke his heart. He steadily refused his food and shortly afterwards died."

Rabbits, mice, rats, sparrows, snakes, toads, frogs, blindworms, newts, lizards, porcupines, leopards, bears, beetles, and spiders, have all been tamed, and of each some particulars are given, but perhaps the most curious pets in the book are the two butterflies with which we conclude. "Having obtained some honey, which I diluted with rose-water, I put one drop into the centre of the open blossoms of a fairy rose and placed the little plant in the cabinet. I soon had the joy of seeing the butterfly flutter round the rose and settle upon it. Whether it really drank or not I cannot say. I thought it must have done so, as it appeared to grow stronger and more lively every day. I fed it in this manner for a fortnight; and by the end of that time it became so tame that it would

step off the flowers and appear quite happy and at rest on my hand. It also appeared to understand that I wished it to come to me when I called it by the name of Psyche, that being the name I had given to the insect. About three weeks after the advent of Psyche we were gladdened by the addition of another butterfly to our establishment—a tortoiseshell. He was strong and vigorous from the first, and flitted swiftly about like a gleam of prismatic light. I used to fancy that they talked to each other, as he at once fell into the other's ways and habits; and when I called Psyche he too would come. They lived in this way until the earth had donned her glowing summer robe of lilies and roses, and then the cabinet was placed with open doors before the window. It was many days before the butterflies ventured to leave the window-sill, and this much to my joy, for I thought that it might be affection for me that held them back. However, one day, with many bitter tears, I saw them depart and join some wild companions, but at night we found them again in the cabinet.

"On the following morning they left us and came not back again until the cold and stormy September weather set in. Yet when in the garden they would come if I called them, and rest for a short time on my hair or hands. At length, on a cold windy day in September, we saw them on the window-sill, and on our opening the window they came in and resumed possession of their old quarters and abode there for the winter. The sun and earth ran their appointed course, until they brought us to another bright June, and again I bestowed the boon of freedom on our fairy pets, who went forth gaily; but alas! never to return. One day after a thunderstorm we found the inanimate form of a yellow butterfly upon the window-sill. I took it up carefully, and did my best to revive it, for I believed it to be the material form of my own beautiful Psyche, who had sought refuge from the storm, but found the window closed. Of this I cannot be sure, for all our efforts to restore her were in vain. The wondrous essence that had given it life, beauty, motion, affection, and memory, had returned to the hand of its mighty Creator, and with Him let it rest!"

FISHING FOR THE MONTH.

DECEMBER.

THIS is the month for the perch *par excellence*, for they now begin to "pack," as it is termed, or herd together. It is not known why they do this, and are apparently very distant friends during the brighter and most salubrious months of the year; but certain it is that as the days draw in and the winds grow colder and the frosts more frequent, they herd very closely, so much so indeed that it is often quite possible to capture three or four dozen fish without once moving from the spot in which you are fishing, and this one after the other almost as fast as you like. One word of caution must, however, be added here. If you, through haste or unskillfulness, happen to lose one, it is some time ere they come on feeding again, and sometimes not at all, so I advise you to be careful.

The best tackle for this season of the year for perch is the paternoster. I will not dive into the whirlpools of etymology for the derivation of the word, though it probably refers to the number of hooks one above the other of which the tackle consists. Suffice it to say that it is effective and easily constructed. (You only really need put on the hooks (No. 6), though of course you can have gimp if you like.) My own "pater" is made by attaching a small perforated bullet on the end of the line. At a foot above this or less, according to the probable depth of the water to be fished, I attach a hook on short gut at right angles, another is attached above this, and a third above the last at equal distances, which are immaterial unless the water be very shallow. In that case of course one can be dispensed with. Minnows are considered the best bait, but I ought to say that not only *Leuciscus phoxinus*—the minnow—but the gudgeon, and, indeed, the fry of all fish are good bait.

Though the perch is styled a "bold biting fool" by the poet Drayton in his "Polyolbion," there is sometimes considerable circumspection in his movements about the angler's lure. At this time of the year most of the swarms you meet are composed of females, with scarcely a male fish amongst them (perhaps that accounts for their extra wisdom), and they will occa-

sionally disdain the captivating minnow altogether. Now is the time to bring your worm-bag into requisition, and even as you are sure to win your sister's goodwill by making her a present of a coral trinket, so surely will Mrs. Perch thank you for that piece of animated coral—a well-scoured red-worm. These baits are remarkably effective when the water is muddy. When there are only large perch in a lake, and they show no disposition to herd—as is sometimes the case—a spinning minnow is a good bait, or the spoon bait is very effective. At this time of the year, however, nothing is so good as the paternoster.

In earlier season fishing for perch alone is sorry sport unless you know that no other fish lurk in the vicinity. When there are many perch and a few chub, etc., it is a good plan to whip under the overhanging boughs with a fly rod and line, with a freshwater shrimp for bait. Sometimes capital sport is thus afforded. Another very amusing method is that given in the late David Foster's "Scientific Angler," and which I quote, not having had an opportunity of trying it myself. He says, "Cast them with a trio of artificial red palmers; . . . these are used as small flies, just as when making them for trout, with this exception—when a fish is hooked no action is taken whatever. The hooked fish will quickly be shown, and will work the remaining palmers indefinitely better than the rodster can; and, incredible as it may seem, by this means each lure will have secured its capture in a very short time after the first was hooked, and the difficulty of landing these contributions adds in no small degree to the diversion of the angler."

Another "dodge" for getting the perch together in lakes, where the tendency to shoal together is not so marked as in rivers, is by means of a sort of ground-bait. Procure a quantity of bones of a sort of ground-bait. These have been denuded of all the saleable meat, but there is still left thin shreds adhering, which you can render additionally attractive by scraping up with a penknife into worm-like filaments. These bones are all strung on a cord of, say, half a dozen yards in length, and lowered overboard in a likely perch spot. You can often fish over them with worms and minnows, and make a bag which otherwise would not result if the fish were not enticed together as suggested. A piece of raw beef is often a capital bait. Yet another ground-baiting plan. Take a large glass globe, such as are sold for goldfish-keeping, and fill it with minnows (and water, of course), tie a fine net or gauze over the top, and let it down in a likely perch-hole. Of course a cord must be attached, and great care exercised not to break it. You can fish all round this for days, and I once caught seven dozen and three perch within a couple of yards of such a contrivance sunk in the lake of a gentleman's park not a hundred miles from Winchester, and all in less than four hours. By the way, a shrimp—especially the pink one—is by no means a bait to be despised.

Don't forget that pike are in good condition, and whilst you are perch-fishing you may very often get hold of one. It is a good plan to take an artificial

bait in your pocket, in case you see a jack of some size on the feed.

So, too, a bright clear morning may invite you to lay aside thoughts of perch, and to realise the scene which, like Falstaff, "in my salad days" I once put into verse as follows:—

(I.)

A frosty morn—the sun has shed
A sparkling mantle on the lawn;
Its twinkling jewels thickly spread,
Glitter and flash in the radiant dawn.
The giant sable-plum'd pines
Are robed in white—o'er them the sun
A blaze of dazzling silver shines,
And glints the laughing river's run.
The cooing doves love and rejoice
Amid the huge firs' diadems;
The yellow-billed bold blackbird's voice
Is heard from 'mongst the laurel stems.
All this we fishers see; and sing
With merry voice a blithesome lay,
"Hurrah for weather fine, and sport
Among the pike on a frosty day!"

(II.)

Deep-bosomed in the glistening scene
The rippling river runs away,
And in its depths of lucid green
We'll find the pike this frosty day.
The white-crowned coots on wavelets dance,
And mock us with a querulous cry;
Kingfishers flash an azure glance;
The ghostly heron mounts on high.
Our oars plash lightly in the stream,
We gear the pliant trusty wand,
The silver bait, with dart and gleam,
Is piled by supple wrist and hand.
Thus through the clear cold air we go,
And gaily, cheerily chant our lay,
"Hurrah for weather fine, and sport
Among the pike on a frosty day!"

(III.)

"Ha, ha! a thumper; give him line!"
"He'll take what line he wants, I trow;"
A full ten-pounder is on mine,
And thrills me through with throb and glow.
How fiercely fights the fish for life!
How gallantly he holds his own!
Was ever such an earnest strife?
Was ever such resistance known?
He throws himself up out in air—
A bar of light—then down he dives,
And struggles here and plunges there;
To gain his covert then he strives.
But no! His strength is gone. He dies.
We o'er him sing a funeral lay,
"Hurrah for weather fine, and sport
Among the pike on a frosty day!"—J. H. K.

be added the business habits they acquire, and which may prove of so much real value to them in after life.

Well, this is the month, not for making repairs, but for looking ahead and considering what is to be done in the coming season. Are you a beginner? Has it only this moment struck you that you would like to keep poultry? Ask yourself and answer for yourself—by aid of the information so often given in these pages—the following questions: What will it cost to commence? Can I raise the funds to make a good start? Have I convenience for keeping poultry in comfort to themselves, and with good hopes of their doing well? What shall I go in for?—laying breeds, breeds for the table, or both? (If both, remember it is to be a happy, not a higgledy-piggledy mixture, or you and your fowls will speedily go to the wall.) What is the nature of my soil and surroundings? etc., etc. There are so many breeds to choose from, and if we rank only by size, we have anything, from the stately Cochins or Langshans to the merry little cheviably bantams.

Well, a word or two now to our boy friend of years, the old poultry fancier. You have gained experience, and we have not to tell you anything very new, but merely remind you of things. Eggs we dare say you will be expecting. Then your feeding must be correct, not too fattening, and somewhat stimulating; you will not of course forget meaty scraps, and you will see that your fowls have shelter and exercise, and everything to make them comfortable and happy, without which they will not lay. The food must even be warm in very cold weather. Do not open the door for them too early in the morning if the weather be wet and stormy. Yours should be either laying, or, if they early hatched, and have laid their complement, they will be seeking to sit. If you do set any now, it must be in a quiet warm place, with light and fresh air, but no draughts.

Keep all straight in the run; keep no birds that don't pay, or are not likely to. You should know the age and breed and history of every pullet and cockerel and fowl in the run. Let your birds on to the grass run if you have a grass run; if not, do not forget plenty of green food, and remember to clean it up next day, for rotting vegetation will breed disease now just as it did in the middle of August or July. Read over the DOINGS for last month and that previous, many of the hints given therein hold good for this as well.

THE PIGEON LOFT.—We predicted a cold and stormy winter, and will be much surprised if it has not come by the time these lines are under the eyes of our readers. (N.B.—We are writing these DOINGS on October 16th, so long must we be in press before our issue comes out. We may state that those of our boys who press for a reply to their queries in a week should take a hint from this statement.) We mentioned something about a garden pigeonry in our last. Birds do excellently well in them, and they do look nice. Plan the erection of a place of this kind in some quiet corner of the garden. Let the size suit that of your pocket or purse. It need not be an expensive affair. Having planned it out on paper, with its comfortable, close, well-thatched living-room and aviary, which ought to be at least three times the size of the former, proceed to business when the weather is fine. Begin by measuring off your ground with a gardening line, and placing down pegs. Then thoroughly level the ground, and rake it and tramp it. Next put down a few dozen barrow-loads of road scrapings; then, having levelled this, bricks are to be laid down, and over this some grouting of Portland cement. The whole should be level and dry before you proceed to erect your building. The more rustic it is the better. Posts put in position and weather-boarding nailed over does very well. The roof should be thatched and the sides either tarred, or, what looks so much better, covered with the rough bark off trees that you may procure at a sawyer's or wood-yard. Posts are placed in position to form the yard, and over this for the sides fine-mesh wire is to be nailed. The roof of this aviary may be the ordinary twine net, which is sold for a penny per two square yards to place over fruit trees. All the ordinary furnishings and comforts of the pigeon-loft must find a place in the pigeonry.

Have you visited any shows? You ought to do so this season. One learns so much, and soon finds out what birds should be like. We will speak about matching in our next. Meanwhile be in no hurry to buy, only keep your eyes skinned, as sailors say.

THE AVIARY.—Begin bird-cage making. It is such a nice employment. You will be awkward at first, but persevere, and we do not doubt you will be able to turn out something really nice. We have little to tell you this month. We need hardly remind you that whatever birds you have must be kept very clean and well-fed, and have fresh water daily, and, whenever it can be got, a blink of December sunshine. A little green food will not be thrown away on your favourites. Do not give dainties; canaries thrive well without them. A tiny morsel of sweet apple or bit of sugar may be excepted, and does no harm.

If at any time a bird seems moping, put it in a warmer corner, give a little egg and bread-crumbs, and put a little saffron or an iron nail in the water. If suffering from cold or so-called asthma, a bit of gum about the size of a pea, with a few drops of glycerine, and paregoric should be put in the water fresh every morning.

THE RABBITRY.—Look out for colds, and remove any rabbit into a hospital-hutch that seems to be ailing; feed it more nourishingly, keep it clean and dry and warmer than usual, and it will soon come round even without medicine. A few drops, say ten, of paregoric does good if there be sneezing and running at the eyes. You cannot be too careful during this month in seeing to the feeding and comfort of the rabbitry.

THE POULTRY RUN.—Many writers recommend the 1 month of December to be specially devoted to cleaning up and repairing. We would advise the poultry-run to be cleaned up specially at no time, but to be always ship-shape. There is no better way for a boy to learn thorough business habits than to keep poultry as they ought to be kept, each day to have its own duty, every month its own particular doings. He ought to read books about poultry, and keep books. Not a new idea that strikes him but he ought to write down, not one jot of experience but

should be entered, nor a penny spent or gained that should not find a place in the day-book; if this is combined with a diary, and the whole indexed, he will have at the end of the year or season something worth studying and worth reading. Then, too, if he finds that he cannot make poultry pay, why he should give it up, and try some other hobby. Boys must not, however, expect to make their little fortunes by this or by any other fancy; if they make pocket-money enough to buy books or scientific toys, they do very well indeed, for to this advantage must

One hard night of frost may lay the seeds of disease that you will be unable to eradicate for months, if ever. So be warned.

THE KENNEL.—What shall we say for our friend the dog this month? The outdoor animal suffers most. Pray see that the wind does not whistle into his kennel. Let his bed be always dry and warm, with oceans of straw in it; but there may be nights so inclement that you would be guilty of a moral crime in leaving the poor fellow out of doors. How grateful a dog is to see the bright firelight on a night like this! Feed extra well, two good solid diets a day, and as much milk as you can afford. Give him plenty of exercise, only do not permit him to go into the water.

It does not do to wash dogs much in winter, but you can well groom them every morning. If he is a big dog this is capital exercise for the boy, who does it far better than the dumb-bells.

The best little dogs for boys to keep depends upon where they are to reside. If in town, get a fox-terrier or English terrier, or black-and-tan Manchester. If in the country perhaps nothing suits better than the rough-haired old-fashioned die-hard, or Aberdeen terrier. They are very affectionate, hardy, good guards, and know no fear. They cost hardly anything to keep. The scraps of the table are ample for them, and an occasional big bone makes a die-hard as happy as a king. They are not pretty any more than a door-mat is, but they well repay their keep.

THE KITCHEN GARDEN.—Tidy up all walks and borders; see to hedgerows and fences. Wheel out manure on frosty days, and wait.

THE FLOWER AND WINDOW GARDEN.—These are both asleep, but you can read the DOINGS for spring and summer months, and make preparations for the coming season.

Correspondence.

T.—The address of the secretary of the Victoria Model Yacht Club is Mr. W. H. Melville, 9, Frederick Place, Bow. The pond is in Victoria Park, and the boat-houses of the Alexandra and Prince of Wales Clubs are on the banks of the same pond. We know of no other clubs in North London, although the numerous reservoirs of the New River Company would be capital places for model yacht sailing. The secretary of the Serpentine Club is Mr. H. Lear, 13, North Street, Westminster, S.W.

A. P. (Moscow.)—You have simply failed to follow the instructions. The calendar has been constructed by hundreds of readers from the description, and a large firm in the north of England took the trouble to print it as described, and it is now issued broadcast. Try again, or try one of the more recent calendars we have given.

BULLDOG.—The "Sailing Boat," by H. C. Folkhard, is published at the office of the Yacht List by Messrs. Hunt and Son, Church Street, Edgware Road. It refers only to full-size boats. For models, try Biddle's "Model Yachting." A more recent book than Folkhard's is Davies's "Boat Sailing," published by Gill, 170, Strand; and there are in addition Dixon Kemp's "Boat Sailing," and Captain Fitzgerald's "Boat Sailing," all for full size craft. Kemp's is the best, but it costs twenty-five shillings.

YOUNG DUTCH AND PETER.—The more work an apprentice gets the better for him. When you are out of your time you can be lazy if you please, or you can work strictly to time, and never do a stroke beyond. But if you wish to do any good to yourself you will find that you can only differ from "all the fellows I know" in prosperity, by differing from them in the amount and quality of your work. "The eccentricity which they despise betrays the power by which you rise."

C. X.—The "Model Yachtsman" is published by T. Grassam, 161, High Street, Hull. It costs one penny per month.

T. WRITER.—For the boilers of model engines you can use sheet copper No. 19, but do not have it thinner. You must harden it by hammering.

SILURIA.—1. Write to Messrs. Stanford, Charing Cross, for their catalogue of geological maps, and select for yourself. 2. The reports of the Civil Service Commissioners can be purchased from Eyre and Spottiswoode, West Harding Street; or Hansard, Great Queen Street, W.C.

NIMROD.—To fish with salmon roe in private lakes may not be illegal, but it is very unsportsmanlike, and we will do nothing to encourage it.

NEMO.—As you have taken in the paper from the very first number, you will find the fullest answer to your queries by looking well back, say to the articles on training in the second volume.

CATAMARAN.—You can buy indiarubber solution so cheap now at the cycle shops that it is hardly worth while to make it yourself. It is rubber shredded fine and dissolved in benzine or sulphide of carbon.

STUDENT.—The "legal rate of interest," if you can call it so, is five per cent.

Y. Z. B.—Consult one of the electricity periodicals, where the schools for telegraph instruction are advertised.

S. E. A.—1. The examination is no longer open to the public. 2. The latest information is to be found in the Admiralty circulars. They are issued with the Navy List.

I. C. H.—When "boiled" oil is mentioned, boiled linseed oil is meant. No other oil is ever sold "boiled," and no mechanic boils it for himself if he can help it. Ask at the nearest colour-shop for "boiled oil," and there will be no difficulty.

A. R. KYD.—Get Martin's "Float Fishing," price two shillings, from Messrs. Sampson Low and Co., and read up his remarks on worm culture.

C. A. HARSTON.—The plates are published in a packet at the close of the volume. The price is given in the numbers for the last week in September in each year.

AN ASKEAN.—1. Bayard was a French knight known for his chivalry—the Chevalier Bayard. 2. The X comes in the centre of the four words Crux, Rex, Dux, and Lex, and the meaning is "for the Cross, the King, the Chieftain, and the Law."

A. S. E.—For "how to place the cricket-field," and how to change at an "over," see the Cricket articles in our second volume.

A DEAL PLANER.—The best way to polish a floor is to coat it lightly with turpentine and beeswax rubbed on with a cocoanut husk cut in half, and used with cup edges downwards. Rub always in one direction.

E. SMITH.—Apply at the Mercantile Marine Office in St. Katharine's Docks. You will there get the information you want. Waterman's Hall is at No. 18, St. Mary-at-Hill, E.C.

A. G.—What a pity you did not ask a few more questions and fill up all the paper! Messrs. Silver and Co., Cornhill, publish "An Australian Grazer's Guide," and will send it on application.

CIVILIAN.—Apply to the Civil Service Commissioners, Cannon Row; or the Secretary of State for India, Whitehall.

MUSICIAN.—1. At the present day there are probably more violin makers and players in Germany than elsewhere. 2. Paganini was an Italian.

J. G. PEARCE.—1. See answer to CIVILIAN. 2. We do not undertake binding. 3. The Christmas part is not paged in the volume, but there is no reason why you should not bind it in. It will not be bound up with the annual issued by us.

Winter Memories.—See our "Boy's Own Christmas Number."

No. 309.—Vol. VII.

SATURDAY, DECEMBER 13, 1884.

Price One Penny.

IVAN DOBROFF:

A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Author of "Harold, the Boy Earl," etc.

CHAPTER IV.—NOVOYE DERAYVNIE.

It is a singular fact that all large towns, certainly all capitals, spread westwards. The tide of life, like the tide of emigration, seems to roll in the "way of the sun"—i.e., from east to west. "The west end" as a rule is the best end, and a great city grows like some advancing monster swallowing up the country in its course westward.

In accordance with this rule the low parts of Moscow lie eastward, and to the worst of these we are now about to introduce our reader. Unlike the "slums" of London, the streets in this uncanny locality are not narrow. The houses are often large, generally of wood, always old and tumble-down. The streets are unpaved, so are the yards in which the houses stand, into which it is a perilous enterprise for a well-dressed person to enter. Unwholesome, pale, wretched faces meet the gaze, and there is a weird gruesome look about the whole district that would warn off any visitor but a policeman or one of the actual residents. Indeed the police seldom go, save in considerable numbers.

"He felt himself raised from the floor as by a giant arm."

On the morning of the day after the abduction of Ivan from Maziellovo, a hackney drosky was seen driving up to a house in this region of ill-repute. It contained two passengers, of whom, to make no mystery, one was Palitzki and the other Ivan. Our hero looked fagged, worried, and dirty, and the tutor looked many shades dirtier than ever.

"I am very sorry I ever came with you, but you called me to you in such a way that I did not like to disobey you. And after all you did not show me the pony which you said we should see before it was given to me! What will Mr. Smirnoff say? How frightened he will be! I think it very wrong in you to give him such a fright."

"Don't be a *durak*! [i.e., a fool], Ivan. I meant to have taken you, after seeing the pony, to my uncle, who has some models of English ships. You can tell Mr. Smirnoff how sorry I was not to have found him!"

"But indeed we ought to have gone back at once to him, and not have remained in that dreadful hotel. How you could do so I don't know. It seems cruel to him. He will feel it terribly!"

"Never mind, Ivan. It was not your fault, but mine. I took you from your play to see the pony come along the road from Moscow, and if we missed it the fault was not yours! He cannot punish you for that!"

"I don't care about punishment. He never punishes; and if he did, I should care less about what I had to bear than the thought of paining him who is so good to me. How wretched he will be if your friend did not see him to say where I was."

"How can my friend help finding him? He went to the Loubiyanka at the right time, I am sure."

Palitzki had invented a little fiction of sending a friend of his to Smirnoff to tell that gentleman what had become of his protégé and of the custodian he had selected for him. The truth was that he had no idea of letting the good merchant know anything of Ivan's whereabouts, or indeed of communicating with Smirnoff at all, until certain plans which we have now to watch were matured. In pursuance of his plot he had driven to the Novoye Deryvanie (new village), the haunt of the most lawless portion of the population of Moscow.

The worst part of this ill-favoured neighbourhood is called Schouvalovsky Peryoulok, and here Palitzki made a pause as if looking for a house which he could not immediately find. He paid the driver, and, turning to a strange-looking individual in a red calico shirt, blue-striped trousers worn very full and very baggy, very high boots, and a greasy flat cap that might have been of any shape when new—it was of none in particular now.

"Can you tell me the way to the house of Mr. Hermann?"

"Why do you want to know? Who are you?"

"I have a number."

"Oh, indeed!" said the stranger, now manifesting a little interest. "And what may that be?"

"I am Number Seventy."

"Come this way."

Ivan's fears began to rise as Palitzki, guided by this new acquaintance, entered the court of a large rambling house built of wood in a very old-fashioned style,

and so decayed in parts as to remind an English spectator rather of the wreck of some old wooden ship that had been washed ashore fifty years ago, and was now falling to pieces. But he was a courageous boy, and although in his heart of hearts greatly disapproving of Palitzki's action in removing him from Maziellovo, he could not suddenly regard the man who had been placed over him as his tutor and guide as his enemy. So, overcoming his dislike to the new phase of life thus opened to him, he put his hand in that of Palitzki's and trudged along at his side, through a crowd of urchins and ruffians, holding his head up fearless and erect. They were somewhat hustled, it is true; but still the unprepossessing crowd made way for them, and no actual violence was offered. Indeed, as they advanced there seemed a disposition to make way for them rather respectfully than otherwise.

At last they entered the house itself—or rather the central building of the group which formed this house. They entered by a doorway, in which the door, more than half off its hinges, hung, a mockery, and no defence. Passing into the entrance-hall, the strange guide opened a little side door leading into a large room, from which another door led into an inner chamber. The farther door of this inner room was closed, so that the interior to which it led was not revealed, but it was evident from the size of the house that there were rooms beyond.

The first room contained three or four plain deal forms or benches generally seen in peasants' huts, and a deal table, on which was quite a collection of bottles of the peculiar shape made in Russia to contain the national poison. Some of these were empty, but the greater number were full. The walls and ceiling, as well as the table and the forms, were all as black as the charred ruins at Berozovo, and all over the grimy floor were scattered the ends of the little *papiros* (or cigarette) which are smoked by men and women alike all through the empire.

The guide strode on before and entered the second room, where, stretched upon a wretched sofa begrimed with dirt, which left no traces of its original colour, and through the well-worn cover of which protruding bits of straw proclaimed the material of the stuffing of the upholstery, there lay a man dressed in a peasant's garb. He was evidently very tall, for the feet, which in the case of ordinary mortals would have found ample room on the uneasy couch, were placed on one arm of the same, while his head rested on that opposite to it.

As the guide and Palitzki entered the room this man started into a half-recumbent attitude on the couch; and then, sitting up fully, exclaimed, "Who are you? What do you want?"

"I am Number Seventy, and want the district chief—letter B."

"What is in the mill-stream?"

"Fish."

"That's good news! What of the Loubiyanka?"

"I think it a safe speculation."

"What's the boy?"

"A pledge, a hostage, and a golden goose!"

"Anton, remove the lad and show him all the dogs."

The guide attempted to seize the hand of Ivan Dobroff, but for the first time the boy showed signs of rebellion.

"No! I won't go with that red-haired butcher; he will kill me, I know. I want to stop with Mr. Palitzki, he is my tutor. I will not leave him!"

Ivan now set up a series of howls, but they had no effect upon the inmates of the mansion beyond causing a hearty laugh from the lungs of the big man on the couch.

"Don't be a little *durak*," said that individual. "Nothing shall happen to you, and if Anton kills you I will kill him directly after; so you are quite safe."

"Not so safe as if you were to kill him now," answered the boy. "Much good it would do me if you killed him after!"

This was received so favourably that the gentleman on the couch called out with a loud voice, "Annie! Annie!" several times, until at last the door of the room opposite to that at which the student and Ivan had entered was flung open, and a bright-looking girl of some eighteen summers entered the room where our friends had all this time been standing. She was a well-dressed lady-like person, and formed a striking contrast with the mean surroundings of the place. She closed the door carefully behind her and stood looking earnestly at the boy, who in his turn stared strangely at her.

"Will you go with Annie and look at some pictures in the other room?" asked our friend on the straw-stuffed dirty sofa.

"Yes," replied the boy; "she looks good; and I like pictures, but I like dogs better."

"Take him with you, and make him as merry as you can. Do what you like to amuse him, and give him something to eat."

"Chorascho," replied Annie, an expression meaning "well," "good," "certainly," "all right," according to circumstances.

"Come with me, little one," said the girl, in a gentle melodious voice that won Ivan at once.

He followed her without a word, and Palitzki remained staring at the door that closed after them in mute astonishment.

"Now then, sir!" said the man on the couch. "We can talk business. Anton, bring in a 'stoff' of vodka and a box of 'papiros.' Can I offer you some tea?"

"No, thank you, but it would be well to give the little boy something substantial, as he has eaten nothing beyond a small breakfast roll of white bread all day."

Instructions were given, and Anton quitted the room, leaving Hermann and Palitzki alone.

"Now," said the elder rascal, "what is in the wind? What do you want of me? And who in the name of Saint Nicolas is that boy in there?"

"I will answer you categorically," replied Palitzki. "First, the Hermann division is blown!"

"I know," said the other, coolly.

"Secondly, as I hold an important position in the corps as 'Number Seventy' I was in the habit of sending signed reports to headquarters. One of these, incautiously expressing my devotion to the cause, and signed with my own name, has by some means fallen into the possession of my employer, who engaged me to act as tutor to the young scamp

now in yonder room. The boy is an innocent little chap, full of fun, and taking advantage of a sort of scrimmage at Mazielovo, I induced him to slip away with me. Finding a return drosky I came right into Moscow. We slept the night at a tracteer's [eating-house], then we walked about vaguely 'to find my uncle,' to throw off suspicion, and now we are here. I want a man sent to Smirnoff to take a paper demanding the document, which must be sent at once to any address you like me to give, and then promising the return of the boy."

"How does that put fish in the mill-stream?"

"Smirnoff is wealthy, and will be very likely to reward the messenger handsomely."

"Yes, with Siberia for life! How about the Loubiyanka? I suppose this is the same rich merchant who is to be 'practised' upon?"

"He is. Now I have told you what is in the wind; I have told you what I want of you; I shall now tell you what this boy is. He is the adopted heir of Smirnoff, the rich merchant of the Loubiyanka. Do you understand?"

"I understand. Take some vodka!"

"Thanks! Do you consent?"

"What are your terms?"

"My terms?"

"Of course! You do not imagine that I am going to be such an unmitigated durak as to send one of my men to Siberia just for the pleasure of serving you? How do I know who you are? You have the pass-word all pat enough, but that proves nothing."

Palitzki smiled, opened his coat, which had been closely buttoned over his chest, and taking a penknife from his pocket, opened with its aid a seam in the inside of the breast of the coat, and from the aperture drew forth a small packet wrapped in an oilskin case. This he carefully opened and showed to Hermann, who perused the mysterious signs thereon inscribed, for there was no writing, and, returning it to the student, observed,

"This is all right enough, but it gives you no authority to command; I can, therefore, make what terms with you I please, although I dare not betray you. Now what terms do you offer?"

"I cannot tell. What do you demand?"

"Halves!"

"What do you mean by halves? I have nothing."

"Well, half the fish in the stream for me, and half of the remaining moiety to be given to the man who runs the risk! Now look here. I am not going to work for nothing. You don't want money so much as the paper, so I propose we act in this way. You write to Smirnoff and tell him that you can produce the boy, but that you have been at great expense for his keep and guardianship, and that as indemnification you require a sum of twenty thousand roubles (£2,000) and the paper to be given up to a person duly accredited by you. Of this twenty thousand roubles, ten thousand come to me, five thousand to the person running the risk of receiving the money, and five thousand you may keep for yourself! Do you agree?"

"Most certainly not," said Palitzki, indignantly. "Why should I rob Smirnoff of his money?"

"Look here, Number Seventy! Do you know who I am? I am at this

moment *Number Three*, and perhaps the most powerful of the whole confederation! Write as I dictate to Smirnoff, demanding your paper and the money, and promising to return the boy. These are my *orders*!"

"Can't do it. As a student of the University my name and address are known to the authorities, and I am in the hands of these authorities. Most emphatically I refuse these terms, and I desire that Ivan be given up to me directly. I will return from whence I came, and manage differently. Ivan! Ivan!"

There was no reply to this call. Palitzki rushed to the closed door, through which he had seen the child disappear, and strove with frantic violence to open it, but all his efforts were unavailing. He tugged, he shouted, and he raved. Suddenly he was seized from behind as in a vice. He felt himself raised from the floor as by a giant arm. The next moment he was flung down heavily and with such force that he lay stunned on the ground as though he were dead.

On the other side of the door a very unexpected scene had presented itself to Ivan. He found himself in a nicely furnished drawing-room, well provided with elegantly bound volumes of French, German, and Russian classical authors. There were large glasses between the windows and a splendid suite of drawing-room furniture. The next room to the drawing-room was a dining-room, and was provided with a magnificent grand piano-forte. This room had a door in the wall farthest from the front of the house, which door was the entrance to the sleeping-room occupied by Annie. A second door nearer the angle of the wall led to the kitchen and to the place where the servants lived.

Before the sofa in the drawing-room was a large oval table, on which was a handsome lamp, a rich porcelain vase, some photographic albums, and other books. The whole place made the impression of a refined and comfortable home, which in a fashionable quarter of the town would have been quite in keeping, but which in a "*slum*" like the Schouvalovsky Peryoulok was singularly out of place.

The young woman who had led Ivan into this place seemed in every way to be the presiding genius which had called up a paradise in that moral wilderness. She herself seemed as much surprised at the sight of Ivan as he had been on seeing her. She held him kindly and gently by the arm and seated him upon the sofa, then she removed the lamp and vase from the little oval table to a more secure position, and, spreading open a portfolio with magnificent photographs representing various celebrated works of art, began a chatting conversation which soon set our hero at his ease.

"Are all these pictures yours?" he asked.

"Yes, but I have more to show you afterwards if you are a good boy."

"I mean to be good, but what is your name?"

"Annie Feodorovna."

"Nice name; shan't call you Feodorovna, but just plain Annie. What a lot of books! Do you like reading?"

"Very much. Reading, music, and drawing are my three delights."

"What do you read? Story books?"

"Not always, I have the best of all books here, and that is my greatest comfort."

"What is that?"

"The Bible."

Ivan was puzzled, for the perusal of the Word is not general in Russia, although the New Testament part of it may be found in most homes, and, thanks to the exertions of the British and Foreign Bible Society, this may be had at a very cheap rate all through the empire. But the teachings of what is generally called the Old Testament are mostly conveyed to the people in such forms as the priests think fit, and, as they are chiefly engaged in the service of the church, this portion of the Word of God is, comparatively speaking, unknown.

"What!" cried our hero. "Are you a heretic?"

"I am a Protestant."

"Oh dear, oh dear! How dreadful! Perhaps you are a German too?"

"Yes, indeed I am."

"What shall I do?" said Ivan, beginning to cry as if his heart would break, and moving away from his newly-found friend, in whom he had been so greatly interested, and by whom he now felt as strongly repelled. "I wish I had disobeyed Palitzki and run into Mr. Smirnoff."

"Don't cry," said the girl, "I would do anything to make you comfortable. I will do you no harm, and only wish to take you back to your friends with a happy face. You must not cry. You shall see all these books, and the one you like best you may keep for your own."

But it was long before Ivan could be comforted. At last he rose from the sofa, fancying he heard the voice of Palitzki calling him. He went therefore to the door at which he had entered, over which a broad, thick, heavy curtain was drawn. On drawing this aside he found a door, which he opened, but instead of finding himself in the room from which he came, and in which Palitzki remained, he discovered a sort of niche formed by the deep doorway, and another door, the back of which was furnished with iron bars right across the whole width. These bars fell into sockets in the upright timbers, and formed effectual barriers against great force.

"Why am I brought to this horrid place?"

"I don't know; but I have been told to take care of you, and I mean to do so if you will let me. What is your name?"

"My name is Ivan Dobroff."

"Well, Ivan, you may be sure that I shall be your friend. Where does your father live?"

"I have no father; but Mr. Smirnoff lives in the Loubiyanka, and he is all the same as a father."

She wrote the name in a dainty little address-book, and then said, "Now, Ivan, you must be very hungry; I shall order the samovar and something to eat, and while that is getting ready you shall write to Mr. Smirnoff, and I will take care to send a letter."

"Will you, though?"

"Yes; and, you know, a German girl keeps her word."

"That is true. Will you please give me some paper, and I will write?"

This modest demand was at once complied with, and Ivan set to work in earnest to write to Smirnoff. During the com-

position of this literary work, Annie had given orders for a repast, which was got ready under her own inspection in the adjoining dining-room, but her preparation was aided by a nondescript peasant servant, who, however, seemed willing to make amends by the excellence of her viands for the forcible detention of the guest.

It was a sort of luncheon that was being prepared. The samovar, or urn, which boils the water was there. The delicious fragrance of the Russian tea, and the more powerful perfume of hot fried sausages, proved too much for Ivan; he threw down his pen with a sigh.

"May we begin?" he asked; "I am as hungry as a wolf! Set dines, too! and pickled herrings! What fun!"

The girl and boy now got on famously together, and as the ice broke more and more beneath the sunny beams of her really kindly heart, Ivan's fear, shyness, and uneasiness about his benefactor vanished; and, just after stowing away a tremendous serving of pirog (pie), Ivan laid down his knife and fork, and, taking a good full view of his entertainer, burst out with the following:

"I say, you don't mean to tell me that such a brick as you are can be a heretic?"

"Why? Can't a heretic give a little boy some sausages? Is that so wonderful?"

"Oh, no! 'tisn't that, but the whole thing is so jolly; it's like a fairy tale where the princess is imprisoned by a wicked gnome, and the boy is changed into a frog, you know! And I think the cannibal would change me into something unpleasant if he could!"

"What cannibal?"

"Why, that dreadful cannibal outside who told you to take care of me—perhaps against dinner-time, when he would eat me!"

"Who do you mean? Surely not Feodor Karlovitch?"

"Yes; that is what they called him. What an awful savage the fellow is! Now isn't he?"

"He is my father!"

"Oh, really! Now I have done for myself! You must take after your mother, I suppose?"

At this Annie laughed very merrily, and Ivan, not a whit behindhand, laughed loud and long. All stiffness was at an end. Ivan felt the goodwill of the girl, and also the effects of the meal of which he had partaken, and the love of fun, never quite dormant even in Russian boys, began to show itself. He talked and laughed as briskly as he had eaten, telling Annie all the funny stories he could think of, greatly interesting and delighting her.

By-and-by Ivan's eyes fell on the handsome bindings of the books in one of the cases, and the door of which he now asked Annie to unlock. When she had done this Ivan was reminded of the Bible he had spoken of just before lunch, and then he said, "Annie, wasn't that all nonsense about your being a German and a heretic?"

"No, Ivan. My father, Mr. Hermann, you have seen."

"Oh, yes," replied Ivan, "and I don't want to see him again. He may be a German if he likes; I don't care. And he looks like a heretic; but you are too good to be either one or the other."

"Do you think Germans so bad, then?"

"Mr. Palitzki says that all the evils in Russia are caused by Germans."

"Don't you like reading?"

"Very much, when it's funny, but what has that to do with the Germans?"

"They invented printing."

"So they did. That was nice of them. And they invented gunpowder, which is nicer still, because I love shooting and battles and fireworks."

"Did a German ever hurt you?"

"No; I never knew many."

"Well, think of one whom you know and tell me whether he is a good man or a bad one."

Ivan pondered a minute, and then said, "I can only recollect Dr. Wolf and Mr. Schumann. The first was very kind to me, and the second saved Mr. Smirnoff from ruin some years ago."

"Now, you see, Ivan, I asked you to think of a German, knowing well that the chances were you would only remember some one who had done you good. Of course there are bad and good in all nations, but it is very wrong to think of any of God's creatures as being all bad."

"But heretics hate us, and so we hate them."

"My poor boy! What a dreadful thing to say! Why should you hate me?"

"Hate you? That's impossible!"

"But I am a German and a Protestant."

"Well, I shall not hate the Germans any more, but I am afraid it is not like a Christian not to hate heretics of all kinds."

"Then, you see, you will find a way to hate me."

"No, I won't. But it sounds so dreadful to be a heretic; I can't bear to think of it."

"But Christianity is love, and we are taught to do good to all and to love all, even as He first loved us."

This was said so brightly and so sweetly that Ivan felt the tears come into his eyes, and he flung his arms round his new teacher in a childish fit of emotion. He was a boy of strong feelings, but was too much governed by caprice, and the violent passions which occasionally swayed him had hitherto been uncontrolled. Strange that the fact of being brought to this den should have been the very means of awakening in his heart a yearning for something beyond the mere formal observance of church ceremonies which had in his mind stood for religion. He had not known a mother, he never knew a sister, and here in this strange haunt of violent men at war with society he found at once mother, sister, peace.

The leading principle in the mind of Annie was self-negation for the good of others. In obedience to this she had renounced the advantages of refined and cultivated society to minister to the wants of her father, a fanatic, who had taken up false views of life and had joined, heart and soul, a band of plotters dangerous to the State. True woman, Annie never asked the question, "Are these principles right or wrong?" All she felt was that a father wanted comfort and aid. This served as a holy call, and at the shrine of filial duty she offered up position, pleasure—in fact, everything that in most minds would make this life worth living. He adored his daughter. As a leader of a desperate gang he was a desperado. Strong in will, strong in

frame, he kept his crew in subjection, and his means had enabled him to provide the retreat for his daughter which we have tried to describe.

Annie was indefatigable in her efforts to amuse and interest Ivan, and thus the day passed away. When lights were brought and the table was laid for dinner, Ivan felt as much at home as though he had been in very deed the brother of the "German heretic."

At seven o'clock the queer-looking old woman who had waited at table in the morning came in and laid the cloth for three, and very shortly after the cannibal, as Ivan had named Annie's father, came into the room by another door than that through which Annie and Ivan had entered. The undisguised horror depicted in the boy's face at the sight of Feodor Karlovitch seemed to yield that worthy extreme satisfaction, as affording a high compliment to his merits.

Annie looked pained, but said nothing until her father remarked to Ivan that he "was not going to eat him," at which she laughed.

"What are you laughing at?" asked this strange father, not unkindly.

"It is so funny that you should say that," replied the daughter.

"Why is that particularly funny?"

Seeing that Annie hesitated, turned red, and looked confused, Ivan chivalrously came to her relief, saying,

"You see I did not know you were Annie's father, and asked her some time ago whether you were a—ca-cannibal!"

This, delivered with considerable hesitation by the boy, amused both father and daughter mightily. She was glad to see the courage which led the boy to face danger in her cause. The man was simply tickled at the joke.

Dinner was now announced by a well-dressed man-servant, and all three went to table.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER IX.—A SURPRISE.

It was a great day when the experiment was completed. For two weeks the fire had been allowed to die out, so

Horror! The cannon had burst! Yes! Against the formidable pressure of the vapour of the water and the

match at the gap in the tube so as to examine the interior.

"Perhaps," he thought, "the earth I plastered round it has been baked into a brick like that outside."

He was right. But a very curious phenomenon presented itself which at first he could not understand. A sort of clay nodule seemed to have detached itself from the lining of the tube and hardened separately.

The nodule was of a reddish colour. It was about the size of an orange, and could easily pass through the gap. Cyprien drew it out, and held it up carelessly to examine it. Then remembering that it was only a piece of clay like the rest, but separately baked, he was going to throw it aside. But it sounded hollow like a piece of pottery.

It was a sort of closed cup in which something seemed to shake.

"A regular money-box!" said Cyprien.

But had he under pain of death been obliged to explain the mystery he could not have done so.

However, he resolved to see what it meant. He took up a hammer and smashed the "money-box."

And it was a money-box, and contained a magnificent treasure. There could be no mistake as to the nature of the pebble which disclosed itself to the astonished eyes of the engineer. The stone was a diamond in its gangue, in every respect like an ordinary diamond, but a diamond of colossal dimensions.

It was as large as a fowl's egg. It looked not unlike a potato. It weighed over half a pound.

"A diamond! An artificial diamond!" repeated Cyprien, in an undertone. "I have solved the problem notwithstanding the accident to the tube. I am a rich man! Alice, my dear Alice, is mine!"

Then he doubted his eyesight.

"But it is impossible! It is an illusion, a mirage! But I'll soon find out the truth."

And without stopping to put on his hat, mad with joy, like Archimedes jumping from the bath when he discovered his famous principle, Cyprien tore down the road from the farm and bounded like a shot into the workshop of Jacobus Vandergaart.

He found the old lapidary examining some stones which Nathan the broker had brought to be cut.

"Ha! Mr. Nathan, you are just in time," exclaimed Cyprien. "Look here! and you, Mr. Vandergaart, see what I have brought you, and tell me what it is."

He put the stone on the table and crossed his arms. Nathan first took it up. He turned pale with surprise, his eyes opened wide, and so did his mouth. He handed the stone to Vandergaart.

Jacobus held it up to the level of his eyes, looked at it in the light from the window, and then looked at it over his spectacles. Then he laid it on the table, looked at Cyprien, and said very quietly,

"That is the biggest diamond in the world."

"Yes! The biggest!" repeated Nathan.

"It had been hardened like a brick."

that the apparatus might gradually cool. Cyprien, considering that the crystallisation of the carbon ought by now to have been effected, resolved to open the mound which covered the furnace.

This was no easy matter. The pick-axes had all their work to do to cut their way through the baked earth. It had been hardened like a brick. At length it yielded to the attacks of Matakis, and the upper part of the furnace, the capital, so to speak, was visible. Then the whole furnace was revealed to view.

Cyprien's heart beat a hundred and twenty to the minute as the Kaffir, assisted by Bardik and Li, lifted off the top.

That the experiment had succeeded he could hardly believe. He was one of those who always doubt themselves. But after all it was possible! And if it had! All his hopes of happiness, of glory, and of fortune were contained in that huge black cylinder which now met his sight after so many weeks of trial!

marsh gas raised to such a tremendous temperature the very steel had been unable to contend. The barrel, although two inches thick, had split like a test tube. On one of its sides about half way down there gaped a huge fissure blackened and twisted by the flames, which seemed to grin in the face of the discomfited engineer.

This was indeed unfortunate! So much trouble to reach a negative! Indeed Cyprien would have felt less humiliated if, thanks to his precautions, the cylinder had resisted the fire—and been found empty. That there might be no diamond inside the tube he was prepared for. But to have heated up and cooled down and cherished for a month or more that old lump of steel, and then to end like this, was the acme of misfortune! He felt inclined to kick the whole concern over his hut—but its weight forbade him.

He was about to leave the spot in despair, when curiosity led him to hold a

"Two or three times as large as the Kohinoor, the Mountain of Light, the pride of the royal jewels of England, and which weighs a hundred and seventy-nine carats."

"Two or three times as large as the Grand Mogul, the largest known stone, which weighs two hundred and eighty carats," said the lapidary.

"Four or five times as large as the Czar's diamond, which weighs a hundred and ninety-three carats!" continued Nathan.

"Seven or eight times as large as the Regent, which weighs one hundred and thirty-six carats," quoth Vandergaart.

"Twenty or thirty times as large as the Dresden diamond, which weighs only thirty-one!" said Nathan, adding immediately, "I should say that after it is cut it will weigh at least four hundred carats! But how can we dare to value it! It is beyond all calculation."

"Why not?" answered Jacobus Vandergaart, who remained the coolest of the two. "The Kohinoor is estimated at a million and a quarter, the Grand Mogul at half a million, the Czar's diamond at three hundred and fifty thousand, the Regent at two hundred and fifty thousand—and that certainly ought—to be worth—four millions of money!"

"It all depends on its colour and

value will be inestimable; but if it is yellow, like most of our Griqualand stones, it will not be worth nearly so much. For a stone of that size, I think I should prefer just a slight tinge of sapphire-blue, like the Hope Diamond, or perhaps a rose tint, like that of the Grand Mogul, or even emerald shade, like that of the Dresden Diamond."

"No, no!" said the old lapidary, excitedly; "I believe in colourless diamonds! Give me the Kohinoor or the Regent! There are gems for you! By the side of them those others are but fancy stones."

Cyprien had heard enough.

"Gentlemen, you must excuse me," said he, hurriedly; "I must leave you for a minute," and, picking up his precious pebble, he ran back along the road to the farm.

Without stopping to knock, he burst open the sitting-room door, found himself in Alice's presence, and, without giving a thought, caught her in his arms and kissed her on both cheeks.

"Hallo! what's up?" exclaimed Mr. Watkins, quite scandalised at the performance.

He was seated at a table in front of Annibale Pantalacci.

"Miss Watkins, I beg your pardon!" stammered Cyprien, surprised at his boldness, but radiant with joy. "I am

Like Nathan and Jacobus Vandergaart, they at once recognised it. Mr. Watkins, it being early in the day, was sufficiently sober to take in the matter at a glance.

"You found that—you yourself—in your claim?" exclaimed he.

"Found it!" answered Cyprien, triumphantly. "I did better than that! I made it! Ah, Mr. Watkins, there is some good in chemistry after all!" and he laughed, and he clasped Alice's delicate hand in his own, and she, surprised at his passionate demonstrations, but delighted at his happiness, stood smiling, as he said, "It is you to whom I owe the discovery! You advised me to return to chemistry. It was your daughter, Mr. Watkins, that made me make artificial diamonds! I render homage to her like the knights to the ladies of old, and proclaim that to her alone belongs the credit of the invention! I should never have dreamt of it without her."

Watkins and Pantalacci looked at the diamond, then they looked at each other and shook their heads. They were completely bewildered.

"You say you made that—you yourself?" said Watkins. "Then it is a sham!"

"A sham!" exclaimed Cyprien. "Well, yes! a sham! But Jacobus Vandergaart and Nathan value it as worth two millions at the least, and perhaps four! Although it is an artificial diamond, obtained by a process of which I am the inventor, it is none the less perfectly authentic! You see, there is nothing missing—not even the gangue!"

"And you are going to make other diamonds like it?" continued Watkins.

"If I like. I can make them by the bushel, and I can make them ten times—a hundred times—as large as that! I will make enough of them to pave your terrace with—to macadamise the roads of Griqualand with if you wish! It is but the first step that costs. Once the first stone is got, the rest is merely a detail—a simple affair of working certain technical formulæ!"

"But if that is so," gasped the miner, turning ashy pale, "you will ruin all the mine-owners! You will ruin me! You will ruin all Griqualand!"

"Certainly!" replied Cyprien. "Who would go grubbing for little diamonds in the ground when you can manufacture big ones that will give you a fortune in no time?"

"But it is monstrous!" exclaimed Watkins. "It is a shame! it is abominable! If what you say is true, if you really possess this secret—"

He gasped for breath.

"Well, you see," said Cyprien, coldly, "I am not merely talking about it; I brought you my first specimen, and I think it is big enough to convince you."

"Well, then," said Watkins, who had at last recovered his breath, "if it is true—you—you ought to be shot, sir! That is my opinion!"

"And that is mine!" Pantalacci thought proper to add, with a threatening gesture.

Miss Watkins rose, looking very pale.

"Shot, because I have solved a chemical problem that men have been trying for the last fifty years?" answered the engineer, shrugging his shoulders. "That is rather too good!"

"There is nothing to laugh at in it, sir!" replied the furious farmer. "Think of the consequences of what you call

"A sort of clay nodule seemed to have detached itself."

quality," said Nathan, who began to recover his senses, and to prepare for the future with a view to a future bargain. "If it is pure and of the first water its

so happy! I have gone mad with joy! Look! see what I have brought you!" and he threw rather than placed the diamond on the table between the two men.

your discovery—of all the work in the diggings stopped—of all Griqualand deprived of its glorious industry—of me reduced to beggary!”

need not be alarmed. What is mine is yours, and you know very well the motive I had in working out the subject.”

Watkins took the hint, and, as he did

lot of diamonds that will soon make your discovery cheap? Why not carefully keep your secret, use it with moderation, and only make one or two stones like that, so as to raise sufficient capital, and become the richest man in these parts? No one would have anything to say against you, things would go on as they are, and you would not have to run counter to all the respectable people in the neighbourhood.”

This was a new view of the question that Cyprien had never dreamt of. There was no mistake about the dilemma; either he must keep his secret, leave the world ignorant of it and abuse it for his own aggrandisement, or, as Watkins very truly said, depreciate at one blow all diamonds, natural and artificial, and consequently renounce the fortune. For what? To ruin every miner in Griqualand, India, and Brazil!

With the alternative thus placed before him, Cyprien hesitated, but it was only for an instant. He saw that to take the side of sincerity, honour, and fidelity to science was to renounce the very hope that had urged him to the discovery.

The sorrow was as bitter, as poignant as it was unexpected. To fall so suddenly from so sweet a dream!

“Mr. Watkins,” said he, gravely, “if I kept the secret of my discovery to myself I should be an impostor! I should trade with false weights, and deceive the public as to the quality of the goods. The results obtained by the man of science do not belong to him alone; they are part of the patrimony of us all. To keep for himself in his own personal interest the smallest part of it would be to commit as vile an act as a man could do! I will not do it! No; I will not wait a week, nor a day, to give to the public the formula which chance and a little thought put into my power. My only reservation will be to give it first of all to those who sent me here. To-morrow I will send the secret of my process to the Academy of Sciences. Good-bye, sir; I thank you for having taught me my duty. Miss Watkins, I was merely dreaming;” and before Alice could move to stop him Cyprien had taken up his diamond and gone.

(To be continued.)

“That is the biggest diamond in the world.”

“Well, I didn’t think of all that, I admit,” answered Cyprien, very frankly. “That is the inevitable consequence of industrial progress, and pure science cannot stop to worry itself about it! As to you personally, Mr. Watkins, you

not want the Italian to know too much, suddenly shifted his ground. “After all,” he said, “you may be right, and you speak like the plucky fellow you are. Perhaps we may understand each other yet. But why do you want to make a

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

Author of “The Two Chums,” “The New Boy,” etc.

CHAPTER XV.

LANG was back at the time he promised, and the Doctor remained ignorant of his visit to Fanshawe. After prayers the first form adjourned as usual to their room, where the events of the day were discussed with animation.

The match took the first place, but Fanshawe’s appearance held the second. The general tone was one of envy; but Garland and Soady took the other side, the former saying he was a cad for passing Mrs. Fellowes without “capping,” although the Doctor might have gone too far in cutting him. Soady added that the Doctor was quite right to cut him as he was smoking; a remark which

called forth a good deal of dissent, for Soady as a rule was not on the side of law and order. Some one called his attention to the fact that he used to chum with Fanshawe to a considerable extent, and had been known to smoke on the sly.

“I know that,” assented Soady; “but the only place I ever smoked in was the top class-room, and the chimney smoked there, so surely I could. But Fanshawe had no business to smoke before the Doctor; ’twas pure cheek, and nothing else.”

“Except bad taste,” added Garland.

Lang did not talk about Fanshawe at

all, though he had seen more of him than all the others put together. He disliked Fanshawe now, and yet he was going to make use of him. Once get this exam business over, though, and he would cut him dead.

It was an immense relief to him to feel that he could play football now without the unpleasant sensation that every half-hour was so much taken from his work. Soady couldn’t make it out.

“Going to pass, Lang?” he asked one day, very near the end of the half.

“Hope so,” was the reply. “It’s no good stewing oneself up; it’s much better to take exercise, and keep healthy.”

"Yes, I s'pose it is," said Soady. "I don't know if I'm not working too hard. Do I look any thinner, do you think?"

"It wouldn't be much loss if you did," put in Tommy, who was hovering about. It was only about ten minutes a day now that Soady was able to give to his little chum, who had consequently made closer friends than ever with Featherstone.

"Look here, Tommy," said Soady, solemnly, "I'll shake you out of your skin if you make rude remarks about my adipose tissue."

"He's getting on with his exam," said the irreverent Tommy; "he's in words of three syllables now."

But Soady looking dangerous, he fled. Lang went to the football field, and Soady mounted to the first-form room, to spend the play hour over a German grammar.

"I wouldn't give much for his chance," he said to himself as Lang walked away.

* * * *

The holidays approached with rapid strides, though to the youngsters, who marked off day by day on the almanack, they seemed to pass with leaden instead of winged feet. But, at any rate, the last week came, a clear proof that time was progressing.

A time of tribulation was this last week to many boys who had hitherto managed to scrape along in the happy-go-lucky way so much affected by the average boy. But during the last week

the Doctor took the various forms in turn and conducted a terribly "all over the place" examination, in the course of which the weak spots of a boy's knowledge were sure to be pitched upon with unerring instinct.

Even the first form did not escape, and Lang found himself the special butt of the Doctor's shafts.

"There's no more chance of you passing the matriculation, Lang, than of your passing the M.A. It will be much wiser for you to postpone it for six months. You must have been wasting your time most shamefully."

Lang had no reply to make, except that he hoped to pass. He wished he had worked a little harder; his passing in the first division now would be too hollow a farce.

Soady reaped the reward of his recent labours in the Doctor's approval. He was about to repeat to Tommy what the Doctor had said, but Tommy, who had just come out of school, was so brimful of news that Soady bottled up his for the present.

"Well, what is it, young 'un?"

Tommy looked round to see that no one in authority had his eye on him, and then indulged in a laugh that made his eyes water.

"Well," remarked Soady, "I've very seldom seen a lower-school boy, whose form has just been examined by the Doctor, discover that there was so much to laugh at in it."

"You wait, Soady; this is how it is.

The Doctor had been giving us toko, bowling everybody over right and left, when he was called out about something. Nobody was left to look after us, so we had a wild sort of time. Then Featherstone began flipping a penny up in the air to see how near he could send it to the ceiling without touching; then Simpson bet him he'd send it nearer, and all the fellows joined in. But that young Featherstone must go and propose that everybody should send one up at once, and they made me stand on a form and watch to decide which penny went nearest. Well, they shot them up, about forty of them, and you know the ceiling's a good way off. Just as they shot, Simpson called out *cave*. Every chap jumped to his seat, and the Doctor came in like a skyrocket. He hadn't taken two steps into the room before down came the pennies like rain. You should just have seen the Doctor jump. Fancy when you're expecting nothing to see the air full of coppers, and hear them clattering on the ground! I thought I'd die, but I didn't."

"What's the sequel?" asked Soady, laughing.

"All the money goes to the football club; so it isn't so bad after all."

"The Doctor must have imagined himself a Danae," said Soady.

"Who's he?"

"You'll learn some day," replied Soady, not being quite so sure of the details as he could have wished.

PETER'S PERPLEXITIES IN PURSUIT OF SCIENCE.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "*Cacus and Hercules*," "*One of Mother Carey's Chickens*," etc.

CHAPTER II.

CHARLIE ROSS was so urgent in agitating for an immediate execution of the grand scheme, and the interest he evinced in it was so great, that Dobbin thought it impolitic to resist, for fear his friend's zeal should cool down. He therefore promised to make his preparations with all possible dispatch. Ross thought everything might be done by the following Saturday, and argued that the acids could be got from the village chemist and the crackers from the iron-monger; "and if that's all, why ever shouldn't we have the fun at once?"

Ross was an impetuous and impatient youngster, not gifted with that calm and cautious deliberation with which Carruthers went about his experiments.

"It's all very well for you to talk like that, young rat. You've got nothing to risk, and merely look to the fun of the thing. But it's precious different for me. My reputation is at stake. What should I do if we were both killed? What a jolly row I should get into with old Poco if we didn't come in to tea, and they sent out to look for us and found us blown into ten thousand smithereens!"

"Well, but, you old ass," replied the rat, grinning at these strange forebodings, "there's no fear if the crackers are timed to go off in an hour. We could get miles away. If we caught a sheep down in Miller's Dale, and soused him there, we should have time to get up to the top of Shepherd's Hill and watch the explosion without any danger."

"Oh, I dare say; and where would Miller's Farm be after it was over? You don't stop to think, Ross. When Professor Stubbs let off a bit of guncotton about the size of a Brazil nut it sent a flame up to the ceiling. What would be the consequence of exploding a whole sheep? Do stop to consider. If, as I tell you, it would kill at least twenty men, what would become of old Miller and Mrs. Miller, and all the little Millers, to say nothing of the farm-labourers?"

"Would it carry so far?"

"Of course. The farm is only in the next field to that where the sheep are kept. And what's a field? No," continued the sage, "we should have to decoy a sheep away from the rest and drive him off to the middle of Hangman's Heath. There are no houses for miles round, so the only danger would be to the sheep. It's a risky business, and the more I think of it the more certain I feel that we ought to put it off till the holidays. I could get the governor to buy me a sheep, and after it went off we might pick up a stray leg or two somewhere in the next county, which would lessen the expense, as we could have it for dinner."

"Well, Dobbin, you know best. But couldn't we try some experiment, at any rate, say on a lamb, next Saturday? There's nothing to do on a half-holiday this term, and it would be so jolly exciting."

The result of this conversation was that Dobbin so far gave way as to commission his friend to procure half a pint

of each acid necessary and a packet of crackers. But Dobbin's mind was ill at ease, and tossed on a troubled sea of perplexity. He racked his brains to find some escape from the dangers that threatened his undertaking. While deeply anxious to satisfy the curiosity of Charlie Ross, he was no less anxious to avoid failure and risk. Convinced of the grandeur of his discovery, he thought that some preliminary experiments should be made before the final issues of the scheme were put to the test.

Some one may suggest that our philosopher might have purchased a sheet of cotton wool, and tried the result of ignition after saturating it with the acids, and thus have avoided the more alarming dangers. But Dobbin was satisfied that guncotton was simply made as the lecturer had stated. He had seen it go up with a flame and a smoke of imposing proportions, and with pardonable reliance on the professor's word he was filled with the engrossing idea of going a step further than any one had ever yet dared to go. He was certain that his idea was original, that it was simple, and, like all great discoveries, he believed it to be the outcome of true genius. It was beyond doubt one of those apparent freaks of chance on which hinge the most stupendous results, and which exert such important influence on the progress of civilisation. He set it down on a par with the discovery of printing, steam-power, and the electric telegraph. Visions floated before his eyes of future glory. Leaning his head on his hand, he curled one leg over the other, and wished that some artist could sketch him in that attitude. It would be such a beautiful companion-picture to that of James Watt and the tea-kettle—Peter Carruthers and the gun-cottoned sheep! Dobbin's soul thrilled with excitement.

That night, after the boys were in bed, when the gas was turned out, and silence and sleep gradually had asserted their sway, the philosopher lay awake, deeply pondering over his vast projects. It would positively be too dangerous to make the first experiment on a live sheep. The animal's personal objections would probably thwart the enterprise. He would have to pay for the sheep if his experiment succeeded, and the expense would be absolutely beyond his means. He scorned to think of anything less, not even a lamb. It was sheep or nothing, and the dangers and difficulties attendant seemed insurmountable.

Dobbin's mental agitation brought bodily disquietude. He heaved a series of gigantic sighs, and rolled about his bed, and lost all desire to sleep. The other boys had one after another succumbed to the influence of that blissful interrupter of care and toil. Measured breathing, varied only by grunts and snores of different tone and intensity, bespoke the reign of sound sleep. Dobbin only was awake, and his restlessness had prevailed to the defiance of sleep. He felt an unwonted desire to go into

the gymnasium and pull himself up on the horizontal bar ten times without touching the ground. He who seldom indulged in such exercises except under compulsion now felt that he must do something of the kind or burst. So inconsistent is the nature of boys.

At last, unable to bear the extremity of fidgets into which he had worked himself, Dobbin got out of bed. He moved noiselessly across the room, went to the window and opened it, looked out and breathed deep draughts of the cold night air. This seemed to give some relief. The moon was shining brilliantly; the black shadows of adjacent buildings lay upon the playground. Suddenly a cat started out from a dark corner and scurried across the gravel, followed by another in hot pursuit. A screech and a yell of unearthly ferocity followed, as the uncanny creatures bounded up the playground wall and disappeared from view. Dobbin shivered as he hurriedly shut the window and crept back to bed, and this time he managed to fall asleep.

Now whether it was that the visions of his dreams brought a new idea to his mind I know not, but after an hour's sleep he awoke and once more got up, with apparently some definite purpose, for he put on his socks and his trousers, and, as he imagined, his slippers, but one was a gymnasium shoe belonging to Smithers, who had thrown it at him while they were undressing. Then he put on his coat and cap, and thus accoutred he left the dormitory. His mind was evidently set upon some desperate resolve. Cautiously feeling his way along the wall, he crept with the stealth of a burglar down the passage. The school-clock struck twelve with solemn strokes. The mystic hour of midnight was upon the world, when boards creak unaccountably, and ghosts are supposed to wander forth.

Dobbin felt his pulses throb as he threaded the dark corridor leading to the stone-hall which communicated with the playground. The door was locked, but he knew that the key was kept on the ledge above for the convenience of the boot-boy, who had to open it at an early hour in the morning. Dobbin got the key, and unlocked the door and passed out, keeping to the deep shadows, and so made his way through the playground into the field. Across this he ran with all haste, and climbed over the wall at the bottom by some well-known helps in the shape of crevices and nails. Scrambling down the other side he got into a grass-grown lane which led to the common. Having emerged upon a corner of this same common, he made for some cottages on the other side.

It may be as well to divulge at once the secret of this midnight escapade. Across the common, in the direction of Dobbin's route, stood the premises of John Galpin, the butcher. As he killed his own meat he generally had some fleeces of sheep hanging up in a shed at the back of the slaughter-house. This

shed, together with a dilapidated outhouse for the cart, a pigsty, and a henhouse, flanked a portion of the common, separated from it only by a rustic fence; and these premises were open to view, like the house of Julius Drusus, to any passing wayfarer.

The butcher's yard was an interesting object for a walk to those boys whose taste for bloodshed had been nurtured upon the exciting literature of the "Red-Handed Scalping Chief of the Ojibbewah Indians" type. Dobbin, though not one of these, was nevertheless acquainted with the geography of Mr. Galpin's estate, and his purpose now was none other than to borrow without the owner's permission the loan of a sheepskin. His intention was to possess himself of a fleece and convey it to a lonely spot in a wood close by, to be used as opportunity might offer in lieu of a living sheep. His prudence admitted this scheme as a dignified compromise, for he was minded to invest a log of wood with the fleece, and so, for all intents and purposes, to construct a faithful model of a sheep on which to elaborate his experiment.

Now this was one of those strangely foolish and unwarrantable acts which, when writing a story for boys, one has some qualms in recording, because certain sensitive critics may cry out aghast at our suggesting such outrageous conduct to that class of animals, prone enough already, in all conscience, to devise and execute acts of mischief and folly. But the veracious historian is loth to distort his work by omitting to interweave the dark threads with the light in the tissues of his narrative. The author will therefore advance, "sans peur et sans reproche," secure in the assurance that no boy who reads this history to the end will ever be tempted to undertake a nightly adventure with the same object, and if he feels disposed to try a similar course for any other purpose, the author sincerely hopes that he will at the outset tumble over the coal-scuttle and get caught, and be so severely flogged by his master that he will never feel inclined to repeat the performance.

By which digression, having somewhat eased his conscience, the author will go on his way.

Dobbin skipped across the common, and arrived out of breath at the paling of the butcher's back premises. Everything was in profound stillness. He could see the grim trophies of slaughtered southdowns hanging like executed criminals from the rafters of the outhouse in grizzly array. He paused a moment to make sure that no one was moving, and then climbed over the paling and sneaked into the shed.

A passing gust of wind now gently broke the silence of night, causing the fleeces to sway to and fro, and raising, as it were, mysterious moans, which might well be the plaintive bleatings of spectral sheep, protesting against desecration of their remains. Ugh! it was a ghastly business, and Dobbin's heart well-nigh sank into—not his boots, but his slipper and gymnasium shoe. However, the thought of his mighty enterprise prevailed against vague superstitions, and, even as the wind passed by, Dobbin mounted on a disused block, such as we see in a butcher's shop with a few choppers adorning it, suggestive of the days of Mary, when men's heads were as often chopped from their bodies as joints from sheep. On this block mounted the midnight marauder, and after prodigious exertions he succeeded in unhitching a fleece, which fell to earth with a dull flump. Dobbin nearly lost his balance, and narrowly escaped the doom of "Fidgety Phil" in the Strewelpeter.

Carruthers lost no time in dragging the fleece from the shed to the paling. It was an unwholesome thing to move, and required his whole strength. It made a dangerous amount of commotion as it swept along the ground, and Dobbin was thankful when he had managed to hustle it over the paling and was himself once more on the common. He felt that it would be a most exhausting process to drag the fleece all the way to the wood; he therefore adopted the only other feasible method, which was to envelop himself in the shaggy covering. This was in no wise a pleasant course, but necessity knows no law.

Seizing hold of those portions which represented the forelegs of the animal when alive, he dragged on to his back the voluminous fleece, the tail and hind legs trailing on the ground, and so arrayed he commenced his retreat.

Clad in this eminently offensive integument, Dobbin proceeded at a tangent across the common, towards the dark prominence of a wood which loomed athwart the horizon. It took him twenty minutes to accomplish this part of his nocturnal ramble.

The sheepskin was heavy, and made him very hot, and impeded his progress considerably, so that he could only mount the sloping ground which led up to the wood at a slow and creeping pace. At this point he had to cross the lane which skirted the wall of the school cricket-field higher up, and just as he was crossing it his courage well-nigh forsook him entirely, for he distinctly heard footsteps, and an exclamation of amazement from some human being who was evidently an eye-witness of his progress. Summoning all his strength, Dobbin pressed manfully up the remainder of the slope, and almost ready to drop from terror and exhaustion he disappeared amid the dark shadows of the wood.

He was profoundly relieved to find that he was not followed, and forced his way through the rough undergrowth to a secluded hollow, where formerly gravel had been dug. Here at last he divested himself of the fleece, which he huddled as best he could into a corner of the pit, and then, taking a short cut through the wood, he reached the lane not very far from the precincts of Highfield House.

Nothing of any moment attended the remainder of his expedition. He climbed over the wall, crossed the field and playground, and found his way safely back to the dormitory without disturbing any one. Quickly undressing himself, he got into bed, and being now thoroughly tired out, he soon fell into a profound, dreamless sleep, only to be awakened by the hoarse clanging of the school-bell.

(To be continued.)

CANOEES, AND HOW TO BUILD THEM

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc

CHAPTER IV.—THE ROB ROY.

AND now to "return to our muttons." In former numbers of the BOY'S OWN PAPER you have had at various times accounts of the adventurous cruises of Mr. MacGregor in the celebrated Rob Roy canoe, and quite lately there appeared in the pages of that paper a most interesting account of the loss of the Kent East Indian by fire.

Rob Roy MacGregor, an infant in arms, was passed into the boats with those of the crew and troops who escaped, his father, then Colonel MacGregor, being in command of the latter at the time.

When writing these articles for the BOY'S OWN PAPER Mr. MacGregor kindly gave me permission to use his description of the canoe invented by him, which I have therefore given unaltered, as no one can better state its salient points and complicated details than

the man who first originated it and afterwards showed the wide and varied uses to which it could be put.

By invitation of Mr. MacGregor I had the pleasure of a most interesting inspection of the various Rob Roys, that of the Baltic, Jordan, etc., and the many objects collected during his canoe travels, which formed quite an extensive museum of extreme interest, not only to a canoeist, but to any one fond of foreign travel; for Mr. MacGregor's researches extended to such out-of-the-way places, thanks to his unique means of locomotion, that he saw the countries he visited as probably no other traveller has done, and in such new and varied aspects as to make the numerous mementoes of these canoe voyages of peculiar interest, for each paddle spoke of the exploration of some new region,

and every little flag, with its silk faded and torn, told of sunshine and clouds, calm and storm, and dangers and trials of many kinds, manfully overcome, cheerfully endured, and graphically related. And now let us hear about the canoe itself, as described by Mr. MacGregor.

The Rob Roy, Mr. MacGregor says, was designed to sail steadily, to paddle easily, to float lightly, to turn readily, and to bear rough usage on stones and banks, and in carts, railways, and steamers; to be durable and dry as well as comfortable and safe. To secure these objects every plank and timber was carefully considered beforehand as to its size, shape, and material, and the result has been most successful. In the efforts to obtain a suitable canoe for this purpose ready made, it was soon found that boatbuilders

might be proficient in the cabinet-maker's work of their calling without any knowledge of the principles required for a new design, especially when sailing, paddling, and carrying had to be provided for at once, and the requirements for each were unknown except to those who had personally observed them and had known how to work the paddle as well as the saw and plane. A canoe ought to fit a man like a coat, and to secure this the measure of the man should be taken for his canoe. The first regulating standard is the length of the man's feet, which will determine the height of the canoe from keel to deck, next the length of his leg, which governs the size of the well, and then the weight of the crew and baggage, which regulates displacement to be provided for. The following description is for a canoe to be used by a man six feet high, twelve stone weight, and with boots a foot long in the sole.

The Rob Roy is built of the best oak, except the top streak of mahogany and the deck of fine cedar. The weight without fittings is sixty pounds, and all complete seventy-one pounds. Lightness is not of so much consequence in this case as good lines, for a light boat if crank will tire the canoeist far more in a week's cruise than would a heavier but stiff craft which does not strain his body every moment to keep her poised under the alternate strokes of the paddle or the sudden pressure of a squall on the sail. Fig. 1 is a

camber, one inch; depth at gunwale, eight and a half inches. The upper strake is of mahogany, and quite vertical at the beam, where

gany, and quite vertical at the beam, where

with his legs in the water. Each carline has a piece cut out of its end (see Fig. 6), so that

the water inside may run along to the beam when the canoe is canted to sponge it out. The after end of the carline at C is bevelled off (Fig. 5 in section) so as not to catch the shins of your legs. All the carlines are

FIG. 8

FIG. 1

section of the canoe with masts and sails, Fig. 2 a bird's-eye view of the deck, Figs. 3 and 4 cross sections at the beam and at the stretcher, Figs. 9, 10, and 11 the backboard and the apron. The other drawings show particular portions more minutely. The principal dimensions are—length over all (AS),

its depth is three inches. The garboard strake and the next on each side are strong, while the next two are light, as it is found that they are less exposed than the others, particularly where all these lower strakes are of oak. The stem and stern posts project over the deck, so that the canoe if turned

narrow and deep to economise strength, and the deck is screwed to them by brass screws so that it might be removed for internal

FIG. 9

FIG. 2

DECK PLAN

fourteen feet; from stem to beam (B), seven feet six inches; beam outside, six inches abaft midships, twenty-six inches; depth from top of deck at C, fore end of the well, to upper surface of keel, eleven inches; keel depth out-

over will rest on these points and on the upper edge of the combing round the well, seven-eighths of an inch deep, projecting half an inch, of steamed oak curved at the corners, and adding by its angular position very much to the strength of the deck about the well. The well is thirty-two inches from C to D, and twenty inches from E to F, so placed that D M is two feet, and thus, the beam of the boat being aft of the midships, the weight of the luggage (G) and of the masts and sails stowed forward brings the boat to nearly an even keel. The additional basket of cooking things at I (Fig. 2) brings her a little by the stern. For a boat without luggage the beam should be one foot abaft the midships to secure an even keel. The deck is supported by four carlines forward and three aft, the latter portion being thus more strengthened because in some cases it is required to support the weight of the canoeist sitting on the deck

repairs. A flat piece is inserted under the deck at the mast-hole (H), which is also furnished with a flanged brass ring. The deck is so arched as to enable the feet to rest comfortably on the broad stretcher J (Fig. 4),

FIG. 10

FIG. 11

the centre of it being cut down in a curve in order that the masts and sails rolled together may rest there when there is no luggage, and be kept under the deck but above any wet on the floor.

When there is luggage (as in the Baltic voyage) the masts and sails were usually put

FIG. 3

BODY PLAN

side, one inch, with an iron band along its whole length three-eighths of an inch wide;

under the after-deck. The cedar deck round the well at E F is firmly secured by knee-pieces, and the boat may be lifted up by any part, and may be sat upon in any position without injury. The luggage for three months, weighing nine and a half pounds, is carried in a black leather-cloth bag, one foot by one foot and five inches deep (G, Figs. 1 and 2). A water-tight compartment may be made by an after bulkhead with a lid to open, so as to allow the air to circulate when on shore.

The floor-boards, about two feet long, rest on the timbers, until at the part below C (Fig. 2); they end at PP (Fig. 7) in notched grooves, which fit into short oak pieces M N, a quarter of an inch thick, sloping forwards on each side of the keel (O). Their ends rest on the garboard streaks, and so lower the heels nearly one inch below the level of the floor-board on to the top of the timbers. The canoeist sits on the floor-boards. I prefer this to any cushion or mat whatever, but of course these can be used, but they should be firmly fixed, especially in rough water. The canoeist's knees touch the combing and the apron-boards, while his heels touch the keel. Thus Fig. 1, from the stretcher to the deck, shows how the shin-bones are supported in comfort, enabling the paddler to sit for hours together without straining. But comfort is additionally secured by my new kind of backboard shown in Figs. 8 and 9 in section and elevation. This consists of two strips of oak eighteen inches long, two and a half inches wide, and united by a cross-piece at Y and another at X, the latter being grooved (Fig. 8) so as to rest on the top of the combing and to oscillate with the movement of the canoeist's back, which is thus supported on both sides along the muscles, while the spine is untouched between the strips. The dotted line U (Fig. 8) is a strong cord passed round all (through a hole in the deck or two eyes), and this serves to keep the backboard in general upright, while it is free to vibrate, or when on shore to be closed down flat on deck or be removed entirely in a moment by unloosing the cord.

The use of this backboard is a leading feature of the canoe, and adds very much indeed to the canoeist's comfort, and therefore to his efficiency. The length and width of the oak strips, and the width of the interval between them, ought to be carefully adjusted to the size and "build" of the canoeist, just as a saddle ought to fit a horse and its rider too. The paddle is seven feet long, flat-bladed, with a breadth of five inches in each palm, which is copper-banded, and made of the best spruce-fir, the weight being little over two pounds. The spoon-shaped blade is better for speed, and a longer paddle is suitable for a racing boat, but for a travelling canoe, where long paddling, occasional sailing, and frequent shoving require the instrument to combine lightness, straight edge, handiness, and strength, it is found that a short paddle is best for the varied work of a long voyage. Leather cups have been usually employed on the wrists of the paddle to catch the dripping water, but round indiarubber rings look much better, and answer every purpose if placed just above the points where the paddle dips into the water in an ordinary stroke. These rings may be had for twopence, and can be slipped on over the broad blade. If necessary, two are used on each side, and they bear rough usage well, while if they strike the cedar deck no injury is done to it.*

After numerous experiments, the following very simple plan has been devised for a water-proof apron, and its application at once removes one of the chief objections to canoes in rough water as heretofore constructed.

It is necessary to have a covering for the well which shall effectually exclude water, and yet be so attached as not to hamper the canoeist in case of an upset, or when he desires to get out of the boat in a more legitimate manner. These desiderata are completely secured by the new apron, which is not permanently attached in any manner to the boat, but is formed as follows:—A piece of light wood of the form in Fig. 10, two feet long and three inches deep at the deepest part, is placed along each side of the deck vertically, so as just to rest against the outside of each knee of the canoeist, and then a piece of macintosh cloth—drab colour is best—is tightly nailed along and over these so as to form an apron, supported at each side on N (Fig. 11), and sloping from the highest part forwards down to the deck in front of the combing, over which its edge projects an inch, and then lies flat. The other or after end is so cut and formed as to fit the body neatly, and the ends may be tucked in behind, or when the waves are very rough they should be secured outside the backboard by a string with a knot. When this apron is so applied, and the knees are in position, their pressure keeps the whole apron steady, and the splash of small waves is not enough to move it. But for rough water I place a string across the end and round two screw-nails on the deck, or an india-rubber cord may be run through the hemmed end and catch on a beading at the fore part of the combing.

A button-hole at the highest point of the apron near the waistcoat allows it to be supported there, but the whole affair will at once separate from the boat in an overset or sudden leap out, and can be lifted off and folded up in two seconds. When you have to get out on shore, or when sailing, it is usually best to stow the apron away so that the legs may be turned into any desired position of ease.

The apron I used in this tour has answered perfectly, but it is to be remembered that it has been perfectly fitted by myself to me and the boat. Several others roughly made for other canoes have, as might be expected, failed to give satisfaction. One important advantage of a canoe is the capacity for sailing without altering the canoeist's seat, and we shall now describe the mast and sails found by experience to be most convenient after three masts had been broken and eight sets of sails had more or less failed. The mast is an inch and three-quarters thick (tapering) and five feet six inches long, of which the part above deck is four feet nine inches. The lugsail (K, Fig. 1) has a yard and boom, each four feet nine inches long, so when the sail is furled the end of the boom and mast come together. The fore leach of the lugsail is two feet long, and the after leach six feet six inches, giving an area of about fifteen square feet. The yard and the boom are of bamboo, and the yard passes into a broad hem in the sail-head, while the halyard is rove aloft through a small boxwood block three-quarters of an inch long, and with a brass sheave, and through another (a brass blind-pulley) well fastened to the side of the mast near the deck, so that the sail can be lowered and hoisted readily. The lower joint of a fishing-rod, four feet nine inches long, is a spare boom. The tack end of the boom is made fast to the mast by a flat piece of leather lashed to its upper part and to the mast so as to be free to swing in every direction. After many other plans had failed this was quite successful, and lasted through the whole voyage. No hole is made in the mast, and no nail or screw driven into it, for these are causes of weakness. Two cord-loops about six inches apart near the masthead support the flagstaff of bamboo cane two feet long, and with a silk flag seven inches by nine inches. When the mast is not used this flagstaff is detached and placed in the mast-hole, which it fits by a button about two inches wide permanently fixed on the staff, the lower end of which rests in the mast-support. The halyard and sheet should be of

woven cord, which does not untwist, and is soft to handle in the wet. The sheet when not in hand may be belayed round a cleat on deck on either side of the apron where it is highest, and thus the cleats are protected from the paddle. For the sake of convenience the mast is stepped so far forward as to allow the boom to swing past the canoeist's breast when the sail is jibbed or brought over. This also allows the luggage-bag to be between the stretcher and the mast.

The mast-hole H is three feet six inches from the stem. The mast-step is a simple wedge-like piece of oak (see R, Fig. 14)

Fig. 14.

made fast to the keel and butting on the garboard strake on each side, with a square hole in it for the foot of the mast. It may be thought that the mast is thus stepped too far forward, but the importance of having the sail free to swing without lying against the canoeist's body or getting entangled with his paddle, which is used in steering, is so great that some sacrifice must be used to secure this point. However, it is found that the boat sails very well on a wind with this sail if the breeze is strong, and in light breezes it is only expedient to sail with the wind well aft when the jib can also be used.

A canoe must have a light, strong, and flexible painter (or head rope), suitable for constant use, because a great deal has to be done by its means in towing on dull water, guiding the boat while wading down shallows or being hoisted, lowering into locks, hauling her over hedges, walls, locks, banks, and even houses, and raising and lowering her (with luggage in) to and from steamboats. The "Alpine Club" rope used in the new Rob Roy was found to be hard and kinky when wet, and the softer rope used in the old Rob Roy was far better. Another kind of brown tanned rope has been recommended. The painter should not be longer than twice the length of the boat. Each end is whipped with wax-end, which sort of fine twine is also invaluable for all the other fastenings, as it never slips. The painter passes through a hole in the stem and another in the stern post, and is drawn tight to lie on the deck in the lines A Y and S Y, Fig. 2. The slack of about four feet is belayed round the windward cleat and coiled outside so that it may be seized instantly when you go ashore or have to jump out to avoid a smash or upset in a dangerous place. This mode of fixing and belaying the painter I adopted after numerous trials of other plans, and it is found to be the best by far.

The jib is a triangle of three feet hoist and three feet foot, the fore-leach fast by a loop passing under the painter and over the stem. The head is fixed by a loop over the mast-head and under the flagstaff button. Thus the jib can be struck while the canoeist remains in the boat by pushing off these two loops with his paddle. To set the jib it is best to land. This is much more generally convenient than to have jib tackle on the mast. The sails are of calico without any seam. This lasts quite well enough, dries speedily, and sets well too, provided that care is taken to have it cut out with the selvage along the after-leach, and not along any of the other sides. Inattention to this last direction simply ruins sails, and it cannot be too often repeated that the success of the voyages of the Rob Roy could not be expected if great care had not been paid to all these details. The new Rob Roy may of course be improved upon, but I have not one suggestion to make, except as to the cooking apparatus, which, in this case used for the first time, was open to many alterations.

But while it is desirable that canoeists

* The paddle of an Esquimaux kayak lately examined was 6ft. 11in. long and 5 1/2 in. broad in the palm, and the ends had the corners rounded off. The Esquimaux used a piece of fish skin wound spirally round the paddle in place of the rings above mentioned.

should experiment in all directions, it is hoped that young sailors will try first at least the plans here explained, and which have stood the severe tests under which perfect success and continual enjoyment were obtained.

The Rob Roys were built at Messrs. Searle's, of Lambeth, where some twenty-three others have been constructed. Mr. Simmons, of Putney, and Mr. Wheeler, of Richmond, have also built some according to the same design, while a large number of canoes have left the

stocks in various parts of the country. A good travelling canoe, costing £15, ought to last a long time, for it is not racked and pulled in pieces at every stroke as a rowing-boat is.

The sails, apron, luggage-bag, and outfit can be had at Messrs. Silver's, Cornhill, the flag and blocks at the Model Dockyard, Fleet Street, where the handy-book is published, and the boom and yard and woven cord at Farlow's, in the Strand.

(To be continued.)

Dolce far niente.

THE SEA KINGS OF OLD ENGLAND.

SEBASTIAN CABOT.

WHO discovered America? The question is more easily asked than answered. Putting aside the very obvious suggestion that it must have been found in turn

by all the many races that have swept over it, whose descendants formed the so-called "aborigines" of each subsequent invader, we

have six nations claiming the honour in historic times. As many, however, of the prehistoric discoverers must have approached it from the Asiatic shore, the question practically narrows itself into which of the Europeans was the first to cross the Atlantic and reach the mainland.

First among the claimants come the Basques, that wonderful race who claim so many things, and—as again in this instance—fail whenever called upon for proofs. Next come the Irish, as a matter of course, who also claim much and prove little. In fact, so utterly devoid of foundation do these claims appear at present that they are only mentioned as curiosities.

The next claim, that of the Scandinavians, is of a different character, and is amply justified. In fact there is not now the shadow of a doubt but that the early Northmen did discover and settle on the mainland of America.

Iceland was discovered in 860; seventeen years after that Gunnbjörn sailed to Greenland. In 986 Greenland was again discovered and settled by Eric the Red; and in the same year Briarne reported he had seen islands to the south-west. In 1000 we hear of Leif's explorations on the opposite coast. In 1007 we have the lands visited and colonised by Thorfinn Karlsefne, and then Vinland—now identified as part of Maine—comes into note, and in the Icelandic chronicles we meet with constant references to it up to 1347. Greenland was looked upon as part of Europe, Vinland as part of Africa, that continent being supposed to turn up abruptly to the north-west. Nova Scotia was then known as Markland, and Newfoundland bore the name of Helluland. Voyages be-

tween all three of the colonies were frequent and trade was not forgotten.

The fourth claim to the discovery of America is that of the Welsh. But as Prince Madoc's voyage did not take place till 1170, long after the Scandinavian settlement, the Welsh claim disappears. Very little about Madoc's visit beyond the bare fact—if it be a fact—has yet been ascertained.

The fifth claim is the Spanish one, on account, of course, of the Genoese Columbus, who, on that eventful Friday morning of the 12th of October, 1492, when thirty-five days out, heard the welcome "Land ho! on the weather bow!" and landed at what he named San Salvador, formerly thought to be Guanahani, or Cat Island, and now identified as Watling Island, the most easterly of the Bahamas. The early life of Columbus, from the time he left school at fourteen and took to the sea, was well adapted to fit him for the task. And when to all his seafaring and fighting experiences with the pirates of the Mediterranean we add his early college education, his constant interest in science, his marriage with the daughter of Perestrello, Prince Henry's navigator, the governor of Porto Santo—one of Europe's most westerly isles—his study of his father-in-law's charts and papers, his living for years in the Madeiras, and in 1477 sailing up the Northern Ocean and visiting Iceland, where legend still told of the exploits of the old Norsemen, we cannot help admitting that the cause of his faith in the land beyond the sea was not quite unintelligible. He had no idea, however, that he had discovered a new continent. He died in the belief that he had reached Asia, and it was not until Vasco Nunez de Balboa had crossed the Isthmus, and Magellan had rounded the Horn, that the greatness of his achievement was appreciated. He had led the way for us across the Atlantic; he had given the world new life; he had inaugurated modern history. It is important, however, to note that his early discoveries were confined to the islands, and that he was assuredly not the first of the moderns to gaze on the continent which is so imperishably linked with his name.

The sixth and last claim to the discovery is that of the English, and supposing that by "America" is meant the mainland, the claim holds good. That in modern times the first European to behold the shores of the mainland of America was an Englishman, is no longer questioned. The Englishman was Sebastian Cabot, an Englishman by birth though not, perhaps, by descent. For only two things are as yet known about his family: the first, that his father was a merchant at Bristol; the second, that his father was *not* the born Venetian Continental annalists have striven to make him. The recent search through the records of Venice revealed the original entry recording that the foreigner John Cabot was naturalised there in 1476—after his famous son had been born.

Sebastian was born at Bristol. For a few years he visited Venice, but his childhood and later boyhood were spent in Gloucestershire. English was his native tongue. He commanded English crews in English ships from and to English ports, and the only time he was in danger of his life from the mutiny of Spaniards and others who after his death made such a desperate struggle to prove him one of their compatriots, was when they denounced him as—an Englishman.

Columbus in his first voyage discovered the Bahamas and Cuba and Hispaniola. In his second voyage, in 1493, he found Jamaica and the Caribbee Islands. He returned in 1496, and it was not until his third voyage that he reached Trinidad, and on the 1st August, 1498, landed on the mainland close by, which he mistook for another island and called Isla Santa.

His early discoveries set all maritime Europe in a blaze, and among the first to think of following in his track was young Sebastian Cabot. John Cabot was then in

business at Bristol, and seeing an excellent opening for trade and glory in his son's proposal, applied for King Henry's countenance to the undertaking. Henry Tudor had already been applied to by Columbus, who came to London on purpose to persuade the king to assist him, and offered him the same terms as he did Ferdinand; but the English monarch declined, and in the event was very sorry for his refusal. When, therefore, the proposal of the Cabots came before him he was only too glad to accept it, and a patent, dated 15th March, 1496, giving the necessary permission to explore beyond sea, was issued to the firm, consisting of John Cabot and his three sons, Louis, Sebastian, and Sanchez. The king reserved one-fifth of the profit, while the privilege of exclusive traffic was secured to the patentees.

Sebastian was delighted. "By this," says he—the "this" being the discovery by Columbus—"there increased in my heart a great flame of desire to attempt some notable thing." The chance had come, and he made the best of it.

Whether John Cabot accompanied him in nominal command of the expedition, as is sometimes stated, is very doubtful. By the terms of the deed there was no necessity for him to do so, and by the accounts of contemporary annalists he did not. The important fact is that the expedition started from Bristol in May, 1497, for Iceland, and on the 24th of June of that year, while Columbus was fighting intrigue in Spain, Sebastian, from his good ship the *Matthew*, sighted Labrador. Years afterwards the Spaniards and other interested parties tried to make Cabot out a foreigner, and shifted his first landfall to Newfoundland, but the error in both cases has been exploded, though there occurs some reason to suppose that in 1494 Sebastian had been out in a single ship, sighted the land about Cape Breton, and returned to urge on his father to obtain the patent. It is important to note that while Columbus took the southerly route by the islands, Cabot, instead of following in his track, went well to the north and struck the old road of the Norsemen.

Having made its way up towards Hudson's Bay the squadron returned, and in May next year Sebastian started from Bristol on a more important expedition. Understanding, "by reason of the sphere," that if he sailed "by way of the north-west" he would "by a shorter track come into India," he boldly thought out and started on the first attempt to make the north-west passage. Taking with him three hundred men to colonise the lands he had previously found, and having a very miscellaneous cargo—"divers merchants of London adventuring small stocks"—he left Bristol. Reaching Newfoundland and Labrador, he bore away northwards, but finding he could make little progress, he returned, landed the unhappy colonists, who were afterwards all killed off by the cold, and then steering for the south ran down the mainland. He had been "so far towards the North Pole that even in the month of July he found great heaps of ice swimming in the sea, and almost continual daylight. Yet he saw the land free from ice, which had been melted by the heat of the sun. Thus observing such masses of ice before him he was compelled to turn his sails and follow west; and, coasting still by the shore, was brought so far into the south, by reason of the land bending much to the southward, that it was there almost equal in latitude with the sea called *Fretum Herculeum*. He sailed to the west till he had the Island of Cuba on his left hand almost in the same longitude. Then he passed along those coasts, called by him *Baccalaos*, because in the seas thereabouts he found such an immense multitude of large fish like tunnies, termed *baccalaos* by the natives, that they actually impeded the sailing of his ships. He found also the inhabitants of these regions covered with beasts' skins, yet not without the use of reason. He also relates that there

are plenty of bears in these parts, which feed upon fish. "It is the practice of these animals to throw themselves into the midst of the shoals of fish, and each seizing his prey to bury their claws in the scales, drag them to land, and then devour them." So says Peter Martyr. Sebastian had in fact surveyed over eighteen hundred miles of the American coastline.

His welcome home was not a very cordial one. The geographical success had been great, but merchants cared little about geographical successes unless they gained money by them. And, beyond three specimens of the natives, afterwards exhibited as a show in London, Cabot brought back nothing. He had not found the way to the Indies, the north-west passage had proved a failure, and his expedition to the south was considered to be contrary to his engagements. The king was busy with his negotiations for marrying his son Arthur to Katharine of Aragon, the daughter of Ferdinand and Isabella, who, as the employers of Columbus, had claimed the whole of America; and as Cabot's discoveries might give rise to unpleasant complications at such a moment, it was thought better to ignore his new proposals.

For some years he waited in vain for the royal patronage, and then the very unsympathetic Henry VIII. having come to the throne, and all hope being at an end, he left the country, offered his services to the Spaniards, and in 1512 was at Seville destined to take command of the expedition to Cathay through the north-west passage. Five years afterwards, however, he was back in England, whence he went out with Sir Thomas Pert on a voyage to Hudson's Bay. Returning to Spain, he was made pilot-major in succession to Columbus, who was the first that held the post, and in 1526 was placed at the head of an expedition to La Plata, which had previously been discovered by De Solis.

The Plate fleet started under sealed orders. Cabot was in command, and under him were Mendez, who had sailed with Magellan, and the brothers Rojas. The orders were to the effect that in case of Cabot's death the captain was to be chosen from one of eleven, and should the whole of the eleven be killed, the survivors should elect their own chief. From the time the ships started a conspiracy, encouraged by these directions, was brewing to get rid of the Englishman, and at last matters got to such a pitch that Cabot, to save his own life, had to seize his three lieutenants and put them ashore. The mutiny was thus quelled, but the captain had no easy time of it for the remainder of the voyage; and after five years' fighting in South America with the natives and the Portuguese under Garcia, he returned to Spain. He had been on the Parana, and had built a fort three hundred and fifty miles up the Plate.

He wanted money to continue his explorations. Charles V. had none to spare; and when Pizarro offered to conquer the country on his own account and give the emperor cash instead of requiring it, Pizarro gained the day—with the results that we know.

Henry VIII. being dead, he left the Spanish service for good, returned to England, and in 1543 was back at Bristol. As he had had the control of the Spanish navy, he was by Edward VI. given that of the royal navy of England, and as grand pilot he had the superintendence of our maritime affairs till his death, the exact date of which is unknown. His will might show; and that may yet be discovered at Gloucester tied up in one of those dirty linen bags in which the documents previous to 1600 still repose.

In our "Thrones of the Ice-King" we caught a glimpse of the old grand pilot as he bade farewell to the Serchethrift on her departure from Gravesend for the north-eastern passage; and as we saw him then so he would seem to have been throughout his life—thoughtful, sanguine, and reverent, a shrewd judge of character, with a pleasant word for all in due season. His instructions

to discoverers—in which he urges that the natives of the strange countries "should not be provoked by disdain, laughing, or contempt, but treated with all gentleness and curtesie," and have their laws and rights respected; enjoins that morning and evening prayer be held, "and the Bible daily read to God's honour and for the grace to be obtained by humble and hearty prayer;" and with simple and affectionate earnestness inculcates upon every sailor personal purity and remembrance of his oath and attention to his "conscience, duty, and charge"—are so many additional testimonies to his being considerably in advance of his age, and differing very widely from the roystering mariners who followed Columbus across the Atlantic.

He was the ablest navigator and most scientific seaman of his time. He was the first to think out the north-west and north-east passages, the first to sheathe his ships, the first to start the whaling trade, the first to organise the Royal Navy, and the first of the moderns to find the American continent—a worthy sea king of Old England, whose name is inseparably joined with that of the Genoese Columbus in the rediscovery of the World of the West.

CHESS.

(Continued from page 143.)

Problem No. 89.

By H. MAIDLOW.

Black to play and win.

Applying the old rule, by which two Queens for one player are not allowed.

An instructive end-game, played in September, 1884.

A GAME FROM ITALY.

Vienna Opening.

WHITE.	BLACK.
E. Orsini.	G. Moreno.
1. P-K 4	P-K 4
2. Kt-Q B 3	B-Kt 5
3. P-B 4	P-Q 3
4. Kt-B 3	Kt-Q B 3
5. B-B 4	Kt-B 3
6. Castles (a)	B-Q B 4 (ch.)
7. K-R sq.	Kt-K Kt 5
8. P x P (b)	Kt-B 7 (ch.)
9. R x Kt	B x R.
10. Q-B sq.	B-Q B 4 (c)
11. B x P (ch.)	K-Q 2 (d)
12. P-K 6 (ch.)	K-K 2
13. P-Q 4	P-K R 3
14. Kt-K R 4	B x K P

15. Kt—Kt 6 (ch.) K—Q 2
 16. B×B (ch.) K×B
 17. Q—B 5, mate.

NOTES.

(a)—This is the ordinary way of castling. The Italians practise the free method of castling, by which the King can move to his B sq., Kt sq., or R sq., and the Rook to any of the squares on the other side of the King as far as King sq. We have only two ways of castling for each player, but the Italians have 18 ways, namely, 8 ways on the K's side, and 10 ways on the Q's side.

(b)—A good move, but Black does not see it, since he follows with check with the Kt.

(c)—The play might have been thus:—10, B—Kt 3. 11, B×P (ch.), K×B. 12, Kt—K Kt 5 (dl. ch.), K—Kt 3 (the only move for the King, to prevent mate in one move). 13, Q—B 7 (ch.), K—R 3 (if he had taken the Kt, there would have followed mate in six moves). 14, P—Q 4, and Black cannot prevent losing his Queen and the game, since White threatens 15, Kt—K 6 (dis. ch.)

(d)—If to K 2, then 12, P—Q 4 (showing that the B ought to have retired to Kt 3, but even then White would have won, as the Bishop threatens to win the Q). Black must answer 12, P—K R 3. 13, Kt—K R 4, and Black has no good reply, as White will continue to check with Kt, P, B, etc.

Correspondence.

J. HOSKINS.—The red cross on the white ground may be the flag of Ireland or of Malta, or, like the other cross, it may be one of the Dutch local flags before the tricolour. There is no book on the subject of extinct flags.

NEMO.—Apply at the post-office for the pamphlet on the Army issued by the Horse Guards.

H. M. S.—To colour a wall peach use white with just a dash of vermilion or Indian red; to colour it buff use white, yellow ochre, and Venetian red. Sage

green is a mixture of white, raw umber, and Prussian blue; pea green is white, chrome yellow, and Prussian blue.

J. J. L. STUART.—1. The author of "Ingoldsby" was Rev. R. H. Barham. 2. To put "up" the helm is to move it to windward, which is the highest side of the deck—hence the "up." The result is to move the rudder to leeward and make the vessel fall off from the wind. 3. Not now.

A. H. B.—A whale is a cetacean; a mammal, a very much nearer relation of yours than the fish.

DOMINUS.—The cutter will beat the sloop, and the sloop will beat the schooner. This is supposing other things are equal, and that you try them all round. A yawl would beat the schooner, and probably equal the sloop.

GORDON.—The "weight" that is put is generally sixteen pounds, and you can get one from nearly every cricket outfitter. Twenty-two-pound shots are occasionally used.

KAPPA.—Boil half a pint of linseed oil in a pipkin over the fire, and stew with it four ounces of mutton fat, four ounces of beeswax, and a small lump of resin. This will give you an excellent waterproof dressing for boots. Brush them with it when it is tepid, and give them two coats before you use them.

AN AMATEUR CHEMIST.—For black "invisible" ink dissolve a fluid ounce of vitriol in a pint of water, and write with it when it has cooled; for blue use a solution of acetate of cobalt; for green use a solution of muriate of cobalt; for yellow squeeze the juice out of an onion. Hold the paper to the fire, and then the writing will come up. As to inks that disappear altogether after a time, there are many known to commerce.

L. PRICE.—Already given. You will find the origin of Easter eggs stated in No. 138, and that of hot cross buns in No. 121.

A. TRIGGE (Montreal).—Much obliged for the paper; it will come in useful. We have given an article on the telescope. The mere list of the mammalia makes a thick octavo volume, so what you ask for is impossible. Perhaps Maunders' "Treasury of Natural History," price seven shillings and sixpence, published by Longman, would prove welcome, but it is not confined to the class you are at present interested in. Rev. J. G. Wood's Natural History, Vol. III. (Routledge), is devoted to the subject, and the information is full. Messrs. Cassell also publish a Natural History that has a good reputation. The "List" is issued by the Zoological Society for the use of explorers, etc.

CASTOR AND POLLUX should write to Mr. John Browning, optician, Strand, for his catalogue; but they will never get a good astronomical telescope for a sovereign.

A STUDENT.—The University Calendars are kept at nearly all the free libraries. Spend an hour or two in consulting them.

COSMOPOLITE.—St. Andrew's Cross is a white one on a blue field. The thin red cross of St. Patrick is charged on it in the Union Jack. The blue of the Jack is necessitated by the St. Andrew; the white edging of the St. George is all that is left of the white field of the old English flag.

BRUM.—You can get puppets of Punch and Judy shows from most large toyshops, such as Cremer's. Try the Lowther Arcade; or why not get some strong wooden dolls, and make them yourself?

M. E.—The largest prices have been given for St. Bernards. One case is on record of a St. Bernard being sold for £800!

FINN MCCOUL.—1. The meanings are simple enough; e.g., that is *exempli gratia*—"for instance"; i.e. = *id est*—"that is." 2. Noel is the French for Christmas. 3. Jewels are not put into watches to ornament them, but to form lasting bearings for the wheels.

G. F. L.—The BOY'S OWN PAPER can be had at every large town in the United States, and at the usual rate.

MAP.—You would find a good selection of maps of Wiltshire, Gloucestershire, and Somersetshire at Arrowsmith's, in Bristol.

C. S. GREENOCK.—1. The horizontal bar should be six feet long, and it should be made of ash. You can get an iron-cored bar from any gymnastic appliance shop for thirty shillings. 2. See our articles on Indian Clubs in the fourth volume.

R. B.—1. You ought to get a very good collie for a five-pound note. 2. The Lord Mayor takes the oath of office as Mayor, not as Lord Mayor. The "Lord" is purely complimentary.

GRYPHÆA.—It is not the sea that rises, but the land that sinks. The sea is a liquid, and retains its level; the land is solid, and its irregular surface is constantly changing. As a matter of fact, the sea gradually evaporates, and the water of the world is less than it used to be. There is no water in the moon.

FRIAR.—Canes are best varnished with hard spirit varnish.

X+Y=22.—A quarterly Navy List will give you the latest particulars as to entering the Navy; and you may get samples of examination-papers from Stanford, Charing Cross, and many other first-class book-sellers.

W. RICHARDSON.—We shall have an article on the subject. We are glad to hear of your success in showing the photographs by reflected light, and note your advice to all readers who possess a lantern to make an aphengescope, for they will find it a most useful and amusing arrangement at a very little cost.

BERTIE HOPE.—You can get an incubator from Christy and Co., Fenchurch Street; or Hearson and Co., 235, Regent Street; or a second-hand one through the "Exchange and Mart."

A. C. SMITH.—Situated as you are, you had far better stay in the colony, and get employment there as soon as you can.

G. SHARP.—The masts of a schooner are fore and main. The mainmast is the principal mast; the foremast is not of such importance. The sails are mainsail, foresail, forestaysail, and jib.

T. S. H.—It is possible to print with invisible ink. Some of the foreign bank-notes have the word "forgery," or rather its equivalent, worked into the lettering of the note, and printed in an invisible actinic ink that is only discoverable by photography. This is a preventive against fraud, for when the note is photographed, as is now always done when an exact copy is required, the word "forgery" stands out in bold letters across the plate.

CYMRAES.—Rub your hand over with wax, lay a string across it here and there, and cover it with plaster of Paris. Just as it sets cut the plaster with the strings, so that the mould will come in pieces when quite dry. Brush over the mould and fill in with fresh plaster, made rather more liquid than what you put on your hand.

MILLER (Lowestoft).—Apply for a map to Stanford, Charing Cross. You can get maps of London at all prices, from a penny upwards. One of the fullest is that in the Post Office Directory.

AN AUNT.—Cover the spot with Fuller's earth, and then take up the carpet and give it a thorough beating. The smell of the paraffin will soon go off.

W. PANTIN.—For a fernery you cannot have a simpler way of fixing the glass than by Portland cement, which will give you a few ornamental rocks round the edges at the same time.

W. H. COUPLAND.—1. "Axe" is correct at the present day; "ax" is the older form and correct for the period when it was written. 2. Russell Street, Covent Garden. 3. A lease for ninety-nine years is supposed to be one for three lives. This is the usual explanation, though another is to the effect that it was in olden days considered impious to complete the century or the thousand years. "This land to be let on lease for 999 years, or the freehold to be sold," is not an uncommon notice in some parts of the south.

GEO.—1. The reference as to birdlime was correct. Try again, Vol. IV., No. 189. 2. Get a price list from any bicycle maker. The prices of the best machines of the different leading firms vary very little. 3. Apply for information to the Consul for the United States, 11, Abchurch Lane, E.C.

A. H. M.—For instructions how to net see our articles in the second volume; and for the sound-post see our articles on the violin in our fourth volume.

LITTLE BLUNDERBLUNDER.—1. The nostrils act as filters, and the breath that reaches the lungs through them is purer than that entering by the mouth. 2. The ultra-fashionable pronunciation of Duchesnes is Dukahn, but why not Ducaee?

FIGARO.—The articles on Indian Clubs were in the August and September parts for 1882.

J. MAINWARING.—Much obliged, but our arrangements were all made. You will find the wreck described in Gilly's "Shipwrecks of the British Navy"; the loss of life was very much less than you state. Verses have always to be trimmed and corrected, but of course some men write more easily than others. The rhyme and rhythm do not "come spontaneously" to many; the idea may suggest the rhyme, but more frequently the rhyme suggests the idea.

CYCLISTS.—1. We never recommend tricycles by any particular maker, and your friend is in error in saying that the notice appeared in this paper. The question as to the inferiority of single drivers is not one of opinion, but of fact. Your own sense must show you that where all the power is applied to one wheel, and the other runs loose, there must be a great tendency to twist. The action is one-sided, and this has to be corrected by the steering-wheel. In the Coventry Rotary the tendency to twist is checked by the smaller wheels being one in front and the other behind the driver, so that there is "head resistance" as well as "rear resistance," to use your own terms, which are rather more expressive than elegant. The question of front steerers and rear steerers is not so easily decided; but for many reasons too long to give here we find that all our scientific friends give the preference to the type of machine with the small wheel in front, and we agree with them. The fact that all the makers of rear steerers have now adopted a front steerer, while very few of the front steerer makers think it worth while to keep rear steerers in stock, is a pretty strong indication of the tendency of public opinion. 2. The Humber type is the fastest of the tricycles, but it is not much safer than a bicycle. 3. In this year's Society of Arts Journal you will find a paper on Cycles by Mr. C. V. Boys, which you would do well to study before you spend money in patenting your invention.

C. V. RIDLEY.—Boil half a pound of logwood chips for an hour in a quart of water, brush the hot liquor over deal you wish to stain, and let it dry. Then give it another coat. Now make another solution of an ounce of green copperas in a quart of hot water, and as soon as it is all dissolved give the wood a coat of it. The wood must be thoroughly dry before you apply the copperas, and you must dry it in the sun, or in a warm room, but not before the fire. To polish this begin with a coating of very thin glue size, and smoothen it off with very fine glass-paper before you apply the French polish.

School & The World

A STORY OF SCHOOL
AND CITY LIFE
BY
PAUL BLAKE,

HOME AGAIN

CHAPTER XVI.

THE last day of the half; the boxes are being packed; farewell visits are paid to the tradesmen of the town, who are looking sharply after those boys who intend leaving the school. One of the shops which does not often have a boy as a customer is at present the scene of a purchase unique in the annals of St. Mary's.

Tommy is the customer, and he is paying a visit to the only music-shop in the town. His object, as he explains to Mr. Burrows, the proprietor, is to purchase a piece of music as a present.

"Is it for a lady?" asks Mr. Burrows.

Tommy rudely laughs.

"No, it's for a boy, one of our fellows, Soady; he's great at music. I want to give him a piece, and if it's got a picture on it I think it would be better."

"Does he play very well, or would an easy piece be best?"

"I shouldn't put it too easy if I were you," said Tommy; "he mightn't quite like it, you know. I've heard my sister say people are rather touchy about music. No, pick out a good hard one. This looks difficult enough."

He opened a piece of music that was black with demisemiquavers.

"Yes, that is difficult. I doubt whether he could play that."

"Never mind, he'll be able to some day, and the longer he is learning it the longer he'll remember me, you see. What's the name of it?"

"It's a polonaise of Chopin."

"Oh! How much?"

"Two shillings, please, sir."

Tommy produced the coin without a murmur. He was in funds just now, having had his fare home sent him. It was calculated at second-class, but of course he was going to travel third-class, and with other fellows spend the difference on personal gratification.

The last evening! No preparation to-night, only larking about in the school-room till the bell rang for prayers, after which came one of the events of the half—the supper. The boys who looked forward to it most were the new ones, who had never been present at one; next to them came those who would be present for the last time—the boys who were leaving school.

The first-form room was a marked contrast to the Bedlam of the schoolroom during the early part of the evening. There was a sort of sadness prevalent in spite of an occasional burst of merriment. It is a sad thing, in a certain way, to leave school; it is like pulling up one's roots. Not that, taken as a whole, it is a thing to regret. It is inevitable, for one reason, and so should be endured without sorrow. Nevertheless, few boys of any thought or character can leave the place where they have spent the greater part of their lives for six or seven years without a temporary depression.

One amongst the number was, however, unfeignedly glad to get away, and that was Lang. He could not help fancying the Doctor's eye was on him, and if by chance he should write to his father to tell him of his want of application there would be a catastrophe. He wanted to get away from all the prying eyes that were around him, to no longer have to avoid Garland.

There was a clearance this Christmas. Ferguson was leaving, so were Garland and Soady. Lang, we know, would not return. To these it seemed as if the school suddenly would dwindle in standing and reputation; it was difficult to believe that their successors would soon be as tall and capable as they were. It always is so. Schools seem to those who have left them to woefully degenerate. "Call these little shrimps boys!" we scornfully think on revisiting the scene of our school-days. "Why, in our time

we had fellows who looked like men!" And it comes with a shock to find that there are three boys who can shy the cricket-ball farther than Parker, who was the swell when we were at school, and considered an unapproachable prodigy.

"Got your speech ready?" asked Soady of Ferguson.

"As nearly ready as it will ever be," was the reply. "I'm not great at gab."

"Who replies?" asked Garland.

"Pickering for the masters, and I don't know who for the lower school."

Prayers were held earlier than usual, and came with startling contrast to the row that had been going on just before. The Doctor beat a hasty retreat, and immediately he had disappeared the school burst as one boy into the dining-room.

There was the supper, cold beef and pickles—the delight of a schoolboy—with jam-tart to follow. Any amount of everything, and, to judge by the way the provisions disappeared, it was easy to imagine that the boys as a rule went hungry to bed, for supper was an institution honoured more in the breach than the observance at St. Mary's.

"Prime, isn't it?" said Simpson to Tommy, speaking with difficulty.

"You shouldn't talk with your mouth full," said Tommy.

"Tisn't full, or else how could I talk?" was the retort.

There is a limit even to boys' appetites, and the table was cleared at last. Then three or four of the masters dropped in, as was the custom, though the Doctor never came. Ferguson was lifted into the chair at the end of the table; he was the senior boy of those going to leave. He knocked on the table for silence, and it was obtained more quickly than seemed probable.

"It's the custom to make a speech," he said, speaking naturally, and with no attempt at oratory. When he wanted a word during his speech he stopped till he thought of it, but did not get nervous. "I've no objection to furnish the usual laughing-stock at these times. Some of us are going to leave St. Mary's, and we want to let you see we don't count the years we've spent here as nothing. So the first toast I have to propose is 'Success to St. Mary's.'"

Hammering of glasses and fists, and three cheers for St. Mary's several times over, followed this admirable effort—admirable for its brevity.

When the noise had subsided Soady briefly proposed the masters, Mr. Pickering to respond. Mr. Pickering did so, and made a very good speech, addressed more to those who were leaving than those who intended to remain. It was listened to patiently, though some of the youngsters thought it rather slow. There was one portion of this speech which rather touched Lang.

"You are going into the world now," said Mr. Pickering, "and you have a fresh start to make. You may have been foolish at school; there is much excuse for you, perhaps, and your parents make allowance for it. But remember the world will not make allowance; if you can't do your work she shoves you aside to welcome a better man. Most of you will have to earn your living; it is very different from getting through your lesson. This may be the turning-point in the lives of some of you; be thankful that you can make a fair start."

Lang wished he were going to start

fair, but it was too late now; he was pledged. But, once the exam passed, he would make up for lost time by work.

The masters retired soon after their toast, and then speeches flew about promiscuously, every one toasting every one else. "The First Form," "The Second Form," "The Cricket Eleven," "The Football Team," and so on. "The Lower School, our successor," was proposed by Ferguson and responded to by Featherstone. This toast was generally the unintentional cause of considerable fun, and on this occasion the expectation was not disappointed. Featherstone, distrusting his powers, had written the heads of his speech on a slip of paper which he held in his hand, attached to a piece of elastic running up his sleeve. When his speech was over the elastic would pull the paper out of sight and he would get credit for an extempore production. Unfortunately, just after he began, his neighbour slapped him on the back to encourage him, and the shock sent the paper flying up his sleeve. It would not come down again. No one could make out what he was at as he vainly thrust his hand up his arm; he lost his head and memory, floundered through a few sentences which had beginnings but no endings, and then suddenly turned to his too-encouraging neighbour and began to punch his head.

Even the jolliest evenings must end some time, though few could believe it was ten o'clock when Mr. Pickering entered. But it was, and the last evening of the half was gone, for some the last evening they would spend at school.

All was bustle next morning. Those boys who went by early trains had a separate breakfast, and were away almost before the others were down. Tommy did not go till later, so he spent all the time he could with Soady. He wanted to give him his keepsake piece of music, but it was not an easy thing to do. He surmounted the difficulty by putting it into his hand, leaving him to gather from the inscription the meaning of it. The inscription was as follows: "Richard Melcombe Soady, Esq. A keepsake from his schoolfellow and friend, Thomas Scott."

"Thomas Scott?" repeated Soady, half to himself. "Oh, of course; Tommy. Do you mean to say you're going to give me this?"

"Yes, if you don't mind," replied Tommy.

"If I don't mind! Why, bless your little heart! I shall value it more than anything I've got, except my watch that my mater gave me when I left home."

"Do you think you will be able to play it?"

"It's rather a fencer, I'm afraid, Tommy, but I'll get the best of it or perish, and when I can play it you shall come and hear me. Do you know, Tommy, I had a little keepsake for you? but I thought I wouldn't give it you till I was saying good-bye."

Tommy knew the reason; Soady was afraid he might feel obliged to give him something in return.

"How do you like this, Tommy?"

As if there could be any question about it! What lower-school boy's heart would not leap for joy to be the possessor of a knife that looked like an ironmonger's shop and a box of surgical implements all in one?

"Well now, Tommy," said Soady, link-

ing his arm in his and walking him round the quad, "we've got to say good-bye. Don't you forget to write to me and tell me all about everything—what rows you get into, and all that sort of thing."

"You've been very good to me, Soady," said Tommy, in a broken voice.

"If you think so, you be the same to some little chap when you've grown bigger. I don't mean spoil him as I came near spoiling you, but just be kind and give him a leg up every now and then when he's in trouble. You believe me, Tommy, you won't be sorry for it when you leave school."

"You ought to know," was Tommy's reply.

The big bell sounded, a signal for the next batch of boys to start. Tommy had to go. He shook Soady's hand, but couldn't trust himself to speak. He never thought to cry when going home for his first holiday, but he was uncommonly near it now.

"Good-bye, young un," said Soady, warmly. "God bless you!"

It was the first time in his life Soady had ever said that. He meant it too.

Another hour and the quad is empty and the schoolroom silent. Some have gone never to return. No more will the

floor shake with their tread, the ceiling echo back their laughter. They have left their schooldays behind them, those days which were such a mixture of gladness and despondency, of intense enjoyment and equally intense misery. They are going to enter the big world now; the small world which they have hitherto known will know them no longer.

They have "left school"!

(END OF PART I.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER X.—JOHN WATKINS THINKS MATTERS OVER.

CYPRIEN left the farm, sad at heart but resolved to do his duty. He made his way to Jacobus Vandergaart. He found him alone. Nathan, the broker, had gone off to be the first to spread the news so likely to interest the diggers. The news did not cause so much excitement as might be supposed, for Nathan did not then know that the huge diamond was an artificial one.

Cyprien had come to old Vandergaart to verify the quality and colour of the stone before drawing up his report.

"My dear Jacobus," said he, as he sat down beside him, "first cut a facet on that boss, so that we can see what is underneath."

"Nothing easier," said the old lapidary, taking the pebble from him. "You have chosen a capital place," added he, as he noticed a slight swelling on one of the sides of the gem, which but for it was an almost perfect oval. "We shall risk nothing in cutting it here."

Without further delay Vandergaart set to work. He took from his wooden bowl a common boort-stone of about four or five carats, and fixed it firmly at the end of a sort of handle. He then began to rub together the exterior surfaces of the two stones.

"We could do it more quickly by cleavage," said he; "but who would dare to amuse himself by hammering at a gem of this value?"

The task was a long and monotonous one. It took nearly two hours. When the facet was large enough to allow of the nature of the stone being seen it had to be polished on the wheel, and that also took some time.

At last the work was finished, and Cyprien and Vandergaart, yielding to their curiosity, took up the diamond to see the result.

A beautiful facet of the colour of jet, but of matchless limpidity and splendour, revealed itself to their view.

The diamond was black!

But this almost unique peculiarity added to rather than diminished its value.

Vandergaart's hands trembled with

emotion as he flashed the facet in the sunshine.

"It is the finest and most curious gem

"What will it be like when we have cut all its facets so that it can refract the light as well as reflect it?"

"As he flashed the facet in the sunshine."

that ever reflected the sunlight," said he, in a tone of the deepest reverence.

"Will you undertake to do it?" asked Cyprien.

"Yes, certainly, my boy, and the honour will be the crowning point of my long career! But perhaps you had better choose a younger and firmer hand than mine."

"No!" answered Cyprien. "Nobody, I am sure, would do the work more carefully or cleverly than you! Take the

confidence. But you know me well enough to see nothing strange in my suggestion. I must leave here at once with my tools and this stone, and get out of the way into some corner where I am not known—in Hopetown or Bloemfontein, for example. I will hire a room and there work in secret, and only return when my work

"away on business," put the key in his pocket and the diamond in his waistcoat, and set out.

Cyprien accompanied him for a mile or two on the road to Bloemfontein. It was night when the engineer returned, thinking perhaps more of Miss Watkins than of his wonderful discovery.

However, having done but scant justice to the dinner Matakai had prepared, he sat himself down at his writing-table and began the report he intended to send off by next mail to the Academy of Sciences. It consisted of a detailed account of his experiment, and a highly ingenious theory of the reaction which had given birth to this magnificent carbon crystal.

"Its most remarkable characteristic," wrote he, "is its complete identity with the natural diamond, and more especially its possession of a gangue."

And Cyprien did not hesitate to attribute this curious result to the care with which he had coated his apparatus with the earth from Vandergaart Kopje. The mode in which a portion of this earth had detached itself from the rest and formed a coating round the crystal was not very easy to explain, but this was a point on which further experiments would doubtless throw some light. It was possible that he had discovered a new phenomenon of chemical affinity, and he proposed to carefully work out the subject. He did not attempt to commit himself straight off to a complete theory of his discovery. His object was rather to communicate the news without delay to the scientific world, and to invite discussion on these hitherto obscure and unexplained facts.

Having made good progress in his memoir, and advanced it so far that only a few additional observations were required for its completion, he sat down to supper, and then went to bed.

In the morning he went for a walk amongst the diggings. The greeting he received was hardly as friendly as it might have been, but this he did not notice. He had forgotten all the consequences of his grand discovery as unfolded the evening before by John Watkins—that is to say, the ruin sooner or later of the Griqualand claims and their owners. This was enough, however, to make a man uneasy in a semi-civilised country, whose people never hesitated to take the law into their own hands when the whim seized them. If the manufacture of the diamond was to become a trade, the millions invested in the Brazilian as well as the South African mines would irrevocably be lost. Most assuredly the young engineer would have done wisely to have kept his secret. But his resolution had been distinctly declared, and he had decided to act otherwise.

On the other hand, during the night—a night of torpor, during which Watkins dreamt of diamonds by the score, worth millions apiece—Alice's father had had time to consider. And his thoughts ran in this wise.

Nothing could be more natural than that Annibale Pantalacci and the other diggers should view with anger and anxiety the revolution which Cyprien's discovery would effect. But for him, merely as the owner of Watkins Farm, the situation was somewhat different. If the claims were abandoned owing to the depreciation of the gems, if the whole mining population were to clear out from the Griqualand fields, the value of his farm would seriously diminish, his

"Cyprien accompanied him for a mile or two."

diamond and cut it at your leisure; you will make it a masterpiece."

The old man turned the stone over and over in his fingers, and sat as if hesitating to tell what was passing in his mind.

"One thing troubles me," he said, at length. "The thought of having under my roof a jewel of such value. Here is a couple of millions' worth at the least in the palm of my hand. It is not wise of me to take such a responsibility on myself."

"None will know of it if you say nothing about it; and, as far as I am concerned, I will not betray your secret."

"Perhaps. But you can be followed when you come here! Suppose you are? There are queer people about! I shall not sleep quietly!"

"Perhaps you are right," replied Cyprien, as he understood the old man's hesitation; "but what is to be done?"

"That is what I am thinking of," said Vandergaart, and he remained silent for a moment or so.

Then he continued:

"Listen, my dear fellow. What I am going to say is of some delicacy, and presupposes that in me you have absolute

is done. In that way I may perhaps outmanoeuvre these rascals. But, I repeat, I am very shy of proposing such a plan to you—"

"But it is a very good one," interrupted Cyprien, "and I shall be very glad if you will start on it."

"I shall want at least a month, and all sorts of accidents may happen to me on the road."

"Never mind, if you think it all right. And after all, if the diamond does go it does not much matter."

Vandergaart looked at his young friend as if he were horror-stricken.

"Has such a stroke of luck bereft him of reason?" asked he of himself.

Cyprien divined his thoughts, and smiled to himself. Then he explained to him whence the diamond had come, and how, if he liked, he could make many more. But the old lapidary—whether it was that he hardly believed the story, or that he did not care to be left alone with a jewel of such price—all the time busied himself in his preparations for starting.

Putting his tools and his clothes in an old leather bag, Vandergaart stuck on his door a notice to the effect that he was

crops would not find buyers, his houses and huts would not let for want of tenants, and some day he might have to bid farewell to some poor a district.

"Good," said Watkins to himself, "but some years will have to elapse before then. Diamond-making has not yet reached a practical stage, notwithstanding Mr. Cyprien. There may be a good deal of chance about it. But, chance or not, he has at least made a stone of enormous value, and if a natural diamond is worth so much, an artificial one under such circumstances is worth considerably more! Yes, we must keep our eyes on this young man. At any rate, we must stop him from proclaiming his proceedings on the housetops. The stone must come into our family, and must not leave it unless handsomely paid for. To keep the maker of it is easy enough, even without committing ourselves too deeply. Alice is there, and by means of Alice I can put the stopper on his going to Europe. Yes; I can promise he shall marry her. I can even let him marry her."

Thus thought Watkins. Hither did his avarice lead him. Throughout he thought only of himself, he saw only himself. And if the old egotist gave a thought to his child it was only to say, "And after all Alice has nothing to complain of. The young fool is not so bad in his way. He loves her, and I fancy she is not indifferent to him. What can be better than to unite two hearts that have been made for each other—or rather to let them hope for the union, which need not take place until matters have shaped somewhat?"

So reasoned Watkins, pitting his daughter's happiness against that little piece of crystallised carbon, and expecting he could keep the scales level.

And in the morning he had made up his mind. He would see how things turned out, and act accordingly.

In the first place he wished to see his tenant again. Nothing could be easier, for the engineer came to the farm every day. In the second place he longed to gaze once more on the diamond that had assumed such fabulous proportions in his dreams.

The second was if anything the greater attraction, and so Watkins strolled down to the laboratory. Cyprien was at home.

"Well, my young friend," said he, most genially, "and how have you passed the night, the first night after your grand discovery?"

"Very well, Mr. Watkins, very well, thank you," was the frigid reply.

"What! you went to sleep?"

"I did. As usual."

"All the millions," continued Watkins, "all the millions you have been making—did not the thought of them keep you awake?"

"Not at all," replied Cyprien. "Don't you see, Mr. Watkins, that the diamond is only worth millions when it is nature's work. A chemist's diamond—"

"Yes, yes, Mr. Cyprien! But are you sure you can make another?—many others?"

Cyprien hesitated. He knew well that in such an experiment something might happen to prevent his attaining a similar result.

"Ah! you twig!" continued Watkins. "You won't answer. Until you have scored again your diamond will retain its value. Until then, why should you say it is an artificial stone?"

"I repeat, Mr. Watkins, that it is out of my power to retain so important a scientific secret."

"Yes, yes, I know," continued Watkins, with a gesture to the engineer not to speak so loudly, as people outside might hear him. "We will talk about that. Never you fear Pantalacci and his lot; they won't tell of you; it is not their interest to do so. Take my word for it. And look here. Alice and I are overjoyed at your success. We are, really. Yes! Can I have a look at the diamond? I hardly had time to examine it yesterday. Will you allow me?"

"I haven't got it now," answered Cyprien.

"You have sent it to France!" exclaimed Watkins, aghast at the thought.

"No, not yet. In its rough state no one could judge of its beauty."

"Who have you given it to, then?"

"I gave it to Jacobus Vandergaart to cut, and I have not the least idea where he has gone to with it."

"You trusted a diamond like that to that old lunatic!" exclaimed Watkins, perfectly furious. "You must be mad, sir! stark staring mad, sir!"

"Bosh!" answered Cyprien. "What

a stone. Nevertheless, the farmer was uneasy, and he would have given a good deal to prevent Cyprien handing over the jewel to the old lapidary, or rather to make the old lapidary bring it back again immediately.

But Vandergaart had demanded a month, and the impatient Watkins had to wait.

Of course his cronies, Pantalacci, Friedel, and their companions, said all they could against the character of the honest old lapidary. In Cyprien's absence they had a good deal to say about him, and invariably remarked to Watkins that the month was nearly up and no Vandergaart had put in an appearance.

"And why," said Friedel, "should he return to Griqualand? Why shouldn't he keep the diamond of large value whose artificial origin is nowhere shown?"

"Because he would never find a buyer," answered Watkins, reproducing Cyprien's argument.

"That is a fine reason!"

"A very fine reason," said Pantalacci. "And believe me, at this very moment the old crocodile is hundreds of miles away. Nothing could be easier than to

"You must be mad, sir!"

does it matter what Vandergaart does with it? How could he get rid of a stone worth so many millions? Do you think he could sell it on the quiet?"

Watkins seemed struck with the argument. It would evidently be rather a difficult matter to dispose of so valuable

doctor the stone so as to make it unrecognisable. You don't even know what its colour is! What is to hinder him from cutting it into five or six pieces and making a batch of good-sized stones?"

Greatly was the soul of Watkins

troubled by these discussions. He began to think that Vandergaart would never come back. Cyprien alone believed in the old man's honesty, and declared that he would return on the day he had said. He was right.

Vandergaart returned twenty-four hours before his time. Such had been his diligence, and so well had he worked, that in twenty-seven days he had cut the stone. He came back during the night to polish it on the wheel, worked at it till he had done, and in the morning of the twenty-ninth day Cyprien beheld him enter the door of the laboratory.

"There is your pebble," was all that the old lapidary said as he placed a small wooden box on the table.

Cyprien opened the box and stood dazzled and motionless. On a pad of white cotton wool lay an enormous black crystal of the shape of a rhomboidal dodecahedron. From it streamed forth prismatic fires of such brilliancy as to light up the whole laboratory. The combination of ink-like colour with absolutely perfect adamantine transparency and wondrous refractive power gave the most startling results conceivable.

It seemed as though he was in the presence of some unique phenomenon, of some unprecedented freak of nature. All idea of value apart, the splendour of the jewel was something to marvel at.

"It is not only the largest, it is the most beautiful diamond in the world," said Vandergaart, with great gravity and in a tone of paternal pride. "It weighs four hundred and thirty-two carats! You have made something to be proud of, my friend. Your prentice hand has made a masterpiece."

Cyprien gave no reply to the old lapidary's compliments. In his own eyes he was but the author of a curious discovery, nothing more. Many others in the chemical field had failed where he had succeeded, it is true. But what use to humanity would be this manufacture of artificial diamonds? In the future it would inevitably ruin all who earn their living by trading in precious stones, and would enrich nobody.

Then he thought of his elation during the first few hours after his discovery. Now the diamond, beautiful as it had come from Vandergaart's hands, appeared to him but as a worthless stone, to which even the prestige of rarity would not long remain.

Cyprien closed the box, and shaking hands with his old friend, hastened off to Watkins Farm.

The farmer was in the lower room, anxious and uneasy, and thinking of the doubtful chance of Vandergaart's returning. His daughter was with him doing her best to allay his suspicions.

Cyprien opened the door and stood for an instant on the threshold.

"Well?" asked Watkins, sharply, as he suddenly rose from his chair.

"Well, honest Jacobus Vandergaart came back this morning," answered Cyprien.

"With the diamond?"

"With the diamond beautifully cut, and it even now weighs four hundred and thirty-two carats."

"Four hundred and thirty-two carats!" exclaimed Watkins. "And you have brought it with you?"

"Here it is."

The farmer took the box. He opened it, and his eyes sparkled almost as much

as the diamond he looked at. Then when his fingers were allowed to close on the splendid crystal, he was so carried away with the thoughts of its colossal value that his excitement became quite laughable.

Tears came into his eyes, and he spoke to the gem as if it were some cherished friend.

"Oh! You love! you superb, you splendid stone! Here you are back again, my beauty! You are magnificent! You are a weight! How much are you worth in golden sovereigns? What shall we do with you, my darling? Send you to the Cape and on to London to be seen and admired? But who will be rich enough to buy you? The Queen herself could not afford so great a luxury! You would take two or three years of her income! She would want a Parliamentary vote! A national subscription! And they'll do it, never fear! And you'll go to the Tower of London and sleep by the Kohinoor, who is but a very little chap by the side of you. What are we to value you at, my pet?"

And then, betaking himself to his mental arithmetic, he continued,

"For the Czar's diamond Catherine II. paid a million roubles and an annuity of four thousand pounds. Surely you are worth a million sterling, cash down, and twenty thousand a year for ever afterwards."

Then, struck with a sudden idea, "Should not the owner of such a jewel be raised to the peerage? Look here, Alice! Two eyes are not enough to admire this with!"

For the first time in her life Miss Watkins looked at a diamond with some interest.

"It is really very beautiful. It glows like the piece of carbon that it is, but like the carbon when it is alight," said she, as she carefully picked it up.

Then, by an instinctive movement that every girl in her place would have had, she turned to the looking-glass and held the jewel to her forehead.

"A star set in gold!" said Cyprien, gallantly.

"True. We'll call it a star!" exclaimed Alice. "Let us christen it the *Star of the Settlement*. What do you say, Mr. Cyprien? Is it not as black as our native beauties and as brilliant as the constellations of our southern sky?"

"Never mind the *Star of the Settlement*," said Watkins, who attached but little importance to a name; "but take care you don't drop it, it will break like glass."

"Indeed! Is it as fragile as that?" answered Alice, scornfully replacing the gem in its box. "Poor star! you are only a mockery—a vulgar bottle-stopper!"

"A bottle-stopper!" exclaimed Watkins, almost choked with horror. "You young people respect nothing!"

"Miss Alice," said the engineer, "it was you who encouraged me to take up artificial diamond-making. It is owing to you that this stone now exists, and your father will allow me, I hope, to offer it to you in remembrance of your happy influence on my work!"

"What!" exclaimed the farmer, unable to hide his delight at so unexpected an offer.

"Alice," continued Cyprien, "the diamond is yours. If you will accept it, I give it!" and Miss Watkins, as her only

reply, held out her hand to him, and he gently clasped it in his own.

(To be continued.)

OUR NOTE BOOK.

BOYS, THINK OF THAT!

Let us serve God in the sunshine while He makes the sun shine. We shall then serve Him all the better in the dark when

He sends the darkness. It is sure to come. Only let our light be God's light, and our darkness God's darkness, and we shall be safe at home when the great nightfall comes. —F. W. Faber.

DAILY DUTY.

I REACH a duty, yet I do it not—

And therefore see no higher; but, if done, My view is brightened, and another spot Seen on my moral sun.

Were it not wisdom, then, to close our eyes On duties crowding only to appal? No! duty is our ladder to the skies, And, climbing not, we fall.—Leighton.

A BOY'S RELIGION.

If a boy is a lover of the Lord Jesus Christ he cannot necessarily lead a prayer meeting or be a preacher, but he can be a godly boy, in a boy's way and in a boy's place. He certainly need not cease to be a boy because he is a Christian. He ought to run, jump, play, climb, and shout like a real boy. But in it all he ought to show the spirit of Christ. He ought to be free from vulgarity and profanity. He ought to eschew tobacco in every form, and have a horror of intoxicating drinks. He ought to be peaceable, gentle, merciful, generous. He ought to take the part of small boys against large boys. He ought to discourage fighting. He ought to refuse to be a party to mischief, to persecution, to deceit. And above all things he ought now and then to show his colours. He need not always be interrupting a game to say that he is a Christian; but he ought not to be ashamed to say that he refuses to do something because it is wrong and wicked, or because he fears God or is a Christian. He ought to take no part in the ridicule of sacred things, but meet the ridicule of others with a bold statement that for the things of God he feels the deepest reverence.—Royal Road.

PETER'S PERPLEXITIES IN PURSUIT OF SCIENCE.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER III.

DING—dong—bell!

"What a horrid smell!" exclaimed Dick Browning, a small boy with red hair, as he lazily rolled out of bed on the morning after the events recorded in the preceding chapter; or, to be more accurate, at a less early hour of the same morning. He was an inmate of Dobbin's dormitory.

"Oh, I say, you fellows," he continued, "how fuzzy the room is! I votes I open the window. Pheugh!"

The wind blowing in soon freshened the atmosphere of the apartment sufficiently to pacify the fastidiousness of that young gentleman's olfactory nerves. Not much was said as the boys dressed. Dobbin himself performed that operation with unusual haste. His nose was not over-particular, as he considered it incumbent on a man of science to be callous to disagreeable effluvia; but he was by no means unconscious that his jacket smelt most objectionable, and this made him anxious to go and ventilate himself in the playground before prayers.

So downstairs he hurried, and spreading out his coat, with repeated flaps he took a morning flight down the playground and back again.

"There goes that mad donkey, trying to fly!" cried Smithers, a lad of joyous countenance, looking out of the dormitory window, and hurling a piece of soap with such true aim that it caught the delinquent on the hip, and for the moment brought him to sober paces, for one leg was sorely wounded, and one hand was called into requisition to rub the injured spot.

"Hullo, maniac, here's some hellebore!" cried the prefect of the dormitory, aiming the contents of a jug with no less true effect, for a full half of the water fell upon Dobbin's unlucky head, and deluged him with a chilly cataract.

"Give a dog a bad name and hang him" is a proverb of which many a dull boy can comprehend the meaning without explanation. Dobbin had learnt its truth already, as now, with one additional lesson upon its application, he repaired to the dining-hall for morning prayers.

"Don't sit here, you old stink-pot!"

"Here, get out, badger!"

"Gee up, old Dobbin!"

"Poof! you smell like a menagerie of polecats and pickled monkeys!"

Such were the unseemly remarks which greeted his appearance in hall that morning.

In the lesson before breakfast the first class were with Mr. Dunthorne in one of the class-rooms. That learned gentleman appeared in due time upon the scene, and seated himself at the desk in front of the boys. He took out his Homer and found the place. The lesson contained that description of Thersites in which the immortal bard seems to have ransacked his vocabulary to find terms of

adequate opprobrium. His epithets are certainly more forcible than polite. Mr. Dunthorne first endeavoured to rouse the enthusiasm of his class by reading to them Lord Derby's translation of the passage.

He then glanced over the Greek and raised his spectacled eyes to survey the boys.

"What's the matter with you all this morning? Have you taken cold?"

It was a curious fact that eight out of the nine boys were huddling as close together as they could, with their eight noses conspicuously buried in their eight pocket-handkerchiefs. The ninth, none other than the unfortunate Dobbin, was banished to the furthest limit of the form, and sat leaning his face on his fists, the picture of disorder and discomfort.

"Move down, some of you. Don't crowd up so. Move down, Robinson, d'you hear?"

Robinson moved down some two inches, which did not perceptibly ease the abnormal pressure.

"Dear me," said the master, "it's rather close in this room. I suppose the window was not opened last night. Just open it now, one of you."

The whole class made a dash to execute the order, Dobbin excepted, who remained immovable.

"One of you, I said. Sit down, all of you. Carruthers, will you open the window? Thank you. Now then, let us begin. Go on, Browning."

Browning went on, and acquitted himself creditably.

"Very good. Carruthers, read the next four lines."

Dobbin stood up, and straightway the eyes of all the class were levelled at him, while a more extravagant parade of handkerchiefs, with suggestive coughs, accompanied their scrutiny.

The woebegone, dishevelled aspect presented by the luckless lad attracted Mr. Dunthorne's inspection.

Eyeing him sternly, the master said,

"Carruthers, you are more than usually untidy this morning, which is saying a great deal. I never like making personal remarks or in any way wounding a boy's feelings, but I must say you appear most disreputably untidy. Come here and let me put your collar outside your coat. Eton collars are part of the uniform of the house. You must be more particular. Come here. Turn round. Wheugh! What have you been up to? You're wet through, and your jacket has a most offensive odour! Pheugh! most offensive!" (Applying handkerchief to nose, and continuing the harangue in a far-off ventriloquistic tone.) "Have you been anointing yourself with mutton-fat? You seem to be reeking with grease. How disgusting! Get out of my sight! Go and change that offensive garment, and get Mrs. Towels to give you some eau-de-

Cologne." (Removing the handkerchief as Dobbin began to retire.) "Get along with you! Pheugh! No wonder your companions found your presence unbearable. Dirty boy! get out of my sight!"

Dobbin was by this time retreating rapidly.

"And look here" (raising his voice), "some time this afternoon write me out that Ode of Horace in Latin and English about *olentem Mævium*."

This parting shot was greeted with much laughter from the other boys, which merged imperceptibly into a mixture of hisses and groans as Dobbin finally disappeared. This episode attached to him the new nicknames of Thersites and Mævius.

His temporary withdrawal from the scene to change his apparel offers an opportunity for looking in at the butcher's and seeing what went on there about the same time.

John Galpin, jovial and burly, dressed in his blue smock, had finished his two cups of coffee and substantial rounds of buttered toast, and having set the boy Simon his morning task, the portly butcher turned out to have a look at the pigs and chickens in the back yard. His eye twinkled as the plump porkers grunted a morning greeting. He chuckled pleasantly to the pullets, and set them a clucking in expectation of their morning meal. And then the slaughterer of cattle and sheep turned him about and cast his eye over the outhouse and shed.

John Galpin took a pride in being very particular about all the arrangements of his premises, even so far as to sift cinders every week over the surface of his back yard.

Now it happened that this operation had been performed only the day before, and his eagle eye was not slow to discover a remarkable disturbance in the condition of the yard in question. Instead of presenting a smooth and even surface, the cinder-ashes were conspicuously swept in a broad path between the shed and the paling. John Galpin turned his head one way and then another. He looked up into the sky, and then across the common. He scratched his head and gazed at the pigs, then at the fowls. But look where he might he could find no clue to the mystery. Ah, yes! surely there were footmarks on the cinder surface. "Curious enough, sure!" said the butcher to himself. "Two young scamps have been prowling about, I'll be bound. One must have had slippers on, and one of 'em ribbed indiarubber soles. That's as plain as daylight. Come from the school too, I'll be bound—the young rascals! Here, Simon, just come out here a minute. What can have made this curious path in the cinders? D'you know?"

Simon came out at his master's bidding and looked at the path, and scratched his head, and proceeded into the shed

and looked up at the sheepskins. Then he delivered his views on the subject in the following language.

"Woll, ef this baint the most extrordinest thing os ci ever knowed, maister! Os zure os oi stands 'ere, there was noine o' they shape-skeens a hangin' up yoster-day. And os zure os oi stands 'ere, oi zeed one of them there shape-skeens a-walkin' on 'is oind legs at the corner of the lane, os oi cum back from a hevenin porty at gran'mother's about arf-past twelve o'clock last noight!"

"What d'you mean, Simon? I suspect your grandmother gave you an extra pint of ale before you started."

"It be true, maister, for all that. Oi've a-heerd tell that strange soights is to be zeed after midnoight in Cut-throat Lane, and now oi've zeed one of 'em with my own oyes; and oi wouldn't go that way again after midnoight, not vor vive vlorins. It's my belief as 'ow that path was made by the shape-skeen as it fluddered along. Ugh! a shape's ghost be an orful soight!"

Simon paused, but seemed to have more to say yet, and encouraged by his master he informed him that the moon was shining brightly at the time, and that his head was as clear as the moonlight. He stated that this was not the first time fearful things had been seen at the spot where a certain old pedlar was popularly supposed to have been murdered twenty years ago; that only a week before a friend of Simon's, called Bill Javers, had come along that way

shortly after midnight, when a horseman suddenly galloped past him, "snortin' and roarin' like a vampire," and Bill Javers had reported to Simon that the horseman's head had horns like a cow, and that fire seemed to flash from his nose. Furthermore this fearful apparition had manifested itself just at the exact spot where Simon saw the spectral sheep. Consequently there was no shadow of doubt in Simon's mind but that this thoroughly explained the path swept in the cinder-ashes.

The butcher scrutinised his assistant attentively during his oration, which was probably the longest and most eloquent ever delivered by Simon, who was not as a rule celebrated for powerful speech. John Galpin marked the lad's earnestness, which forbade suspicion, and approaching the fence he found a tuft of wool sticking on a nail. This seemed to corroborate the main point of the strange story he had just heard. The sheepskin had to all appearances taken a nocturnal journey, but John Galpin had his doubts as to the ghostly nature of the transaction. The footprints contributed a human element to the problem which could not be lightly disregarded.

"There's been a pair of young rascals prowling about here last night, Simon, who could give an account of the matter, I'll be bound, if we could only catch them. Look at those footmarks. They weren't made by you or me. We don't wear such gimcrack shoes. They just came from Highfield House—that's what

I think. One of them had slippers, and the other those indiarubber shoes they use in the gymnasium. You know what they're like, Simon. You've seen them wearing 'em often when you've taken up the meat."

"Oh yes; oi've a zeed 'em, maister; but as zure as oi stands 'ere, there warn't no boys about last noight when oi zeed the shape."

"Well, I can't help that," replied the butcher. "Just come along and show me where you saw the beast. I fancy we shall find a trace of him."

The two climbed over the fence and crossed the common to the corner of Cut-throat Lane.

"There be the oidential spot, maister. Oi was just comin' round the corner, and this bank was in clear moonlight, and the ghost glided up the bank under the trees, and oi shook wi' froight, and could 'ardly 'elp faintin' outright."

John Galpin looked up the bank, and then went up it, but no trace or clue to the mystery could he find; and after a brief search he came down, and said,

"It beats me altogether, Simon, but I shouldn't wonder if some of the young gents at the school have been up to a lark. I'll take the meat up myself this morning and see the Doctor about it."

So saying, he returned to his premises with Simon, man and boy being absorbed in cogitation upon the strange business.

(To be continued.)

"What can have made this curious path?"

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Author of "Harold, the Boy-Earl," etc.

CHAPTER V.—ZAKOLNIKI.

A LITTLE way out of Moscow there is a pleasant retreat from the dust and excessive heat of the town called Zakolniki. The pine forest there is said to be peculiarly efficacious in curing disease of the lungs. All round this wood datches have been built (of the same material), until quite a large town has arisen.

It is an easy drive from Moscow, and there is now a tramway, which deposits travellers within an easy walking distance from the trees. Society is mixed at Zakolniki. Some rich merchants have built datches there, so as to be not too far removed from town and business. *Chinovniks* (officials under the Crown) pass their summer there cheaply. Small tradesmen take their families there for change of air, as the London cockney takes his to Richmond or to Highgate. Officers of the garrison frequent the "Ronde Point," where a military band plays on Sundays, and on certain other days in the week determined upon by the committee of ways and means. It would not be called emphatically a place of aristocratic resort, but still persons of distinction do not disdain Zakolniki at times.

Smirnoff is in Moscow, deep in clever plans for amassing roubles. But he is

greatly changed. There are traces of sorrow in his manly, benevolent, yet "eminently commercial countenance." Ivan Dobroff is much on his mind, and he grieves for the little fellow as though he had been really his own son. The boy had twined himself round the man's heart in a very extraordinary manner when we consider how very few opportunities they had of cultivating their mutual liking or disliking.

To be near his place of business Smirnoff had bought a datche at Zakolniki. This he caused to be well but plainly furnished, and quite in Russian taste. There was plenty of carved wood-work decorating the entrances and the windows within. The tables were of the old-fashioned oval pattern, standing stiffly and formally before the sofas, in what we should call the drawing-room. In the "cabinet," as the study of the master of the house is called all through Russia, were four handsome bookcases, with some of the choicest works of

Russian, German, French, and English authors. In the centre of this room was a large and very handsome writing-table with drawers. This stood on a rich Turkey carpet, the only carpet in the datche. The floors being all highly polished, and as the datche was only used in summer, carpets were useless luxuries.

On the walls of the room, which was panelled with deal wainscot work and not papered, were several photographs, and a very well-executed portrait of Alexander II. hung between the windows. Among the photographs were several of the same person, a boy, at various periods of his life, from the little prattler of five or six years of age to the schoolboy of ten or eleven. This last portrait was a large oval of life size, representing our hero in the blue uniform of the Gymnasium.

Around this picture were portraits, in smaller size, of various friends of the master of the house—rich merchants, one or two general officers, a professor of the University at Moscow, the managing director of the "Merchants'" bank at the same town, and a priest.

A sober-looking servant was carefully arranging his master's table, and putting the writing materials in order, when a deep-mouthed bark caused him to pause in his work and go to the window which led on to the verandah. He looked out and exclaimed,

"Hallo there! what's in the wind now? It is only half-past six, and Mr. Smirnoff will not be here before seven."

But the dog barked on as though he said, "Of course! I know my business; but this is a stranger." Trifon understood him, and translated the barks into Russian in his own mind.

The dog was a Danish wolf-dog, confined in a sort of inner court containing the stables, coach-house, and other buildings of the kind, and cut off from the main court, or *dvor*, by a palisade of high wooden palings fixed at about three inches apart. The gates leading to this smaller court were closed, so that the dog, in his sober grey coat, seen through the intervening spaces between the palings, looked like some rare animal—which he was—through the bars of a menagerie. He was greatly excited as a little carriage—or rather two-horse drosky—drove up at a great pace and stopped before the door.

A tall, stout man, dressed in an enormous mantle with a tremendous cape, which concealed his uniform, was sitting in this vehicle, but the small *képi*, or full-dress cap of black, edged with silver lace and surmounted by a horsetail plume, showed that he was a police officer of high rank.

A groom behind the palings, having remonstrated with the dog for the unreasonable row he was causing, induced that "rare animal" to enter a vacant stable and avail himself of a comfortable bed of straw specially provided for his use and benefit. The man then opened the gates,

and, the officer having left the vehicle, the dvornik invited the coachman to drive into the inner yard, as Mr. Smirnoff would be some time yet.

The coachman acceded, and, after walking the horses several times slowly round the larger court, entered the smaller enclosure. Here stable-helpers, a small terrier, and a groom—the special favourite of the master of the house—united in doing the honours of the establishment to the new-comer.

Meanwhile the police officer stalked into the house, and in the inner hall allowed his mantle to slide off his shoulders into the ready hands of a domestic. This operation revealed a tall, stout man of about fifty-five or sixty years of age, but as firm and erect as though he had been thirty years younger. He entered the room which we have called the study, having passed through the *salon*, the dining-room, and the drawing-room.

On reaching this sanctum his glance fell on the large oval portrait of Ivan Dobroff, which he examined with searching interest. He then looked at the other smaller photographs very narrowly. He next took out a small silver cigarette-case, from which he extracted a cigarette, and, approaching the writing-table, opened the match-case—which is never absent from a Russian writing-table—and was soon surrounded by a thin halo of smoke. Having thus made himself comfortable, he opened a thin book which he had drawn from the breast-pocket of his handsome uniform, now unbuttoned for the purpose. He was still busily engaged in making notes in this book when the master of the house came home, and this was perhaps half an hour after the arrival of the "general."

On entering the room Smirnoff addressed the officer—who had risen, and was advancing towards him with great courtesy—as "General Kakaroff."

"What fortunate occurrence secures me the honour of this visit? I hope there is nothing the matter?"

"Nothing in the world! I have taken the liberty of calling upon you to ask your advice, and perhaps aid, in a very difficult matter in which you are yourself concerned, and which has excited attention in the very highest quarters."

"Of course, whatever I can do is at your command, but it strikes me that you may want my help to find out the whereabouts of my poor little boy. Is not that the case?"

"Precisely so, my dear sir. And I am sure you will pardon my asking you a few questions."

"Whatever you please."

"Well then, to begin, I suppose that portrait represents the missing boy?"

"It does."

"Is it a good likeness?"

"It was taken by Mœbius."

"That is enough. But would you allow me to have a copy?"

"Mœbius has the plate. I will send at once and order a fac-simile."

He was just about to touch the hand-bell on his writing-table, when the "general" stopped him, saying,

"Please say nothing about it to the servants. If you will kindly order a copy for me yourself I should be greatly obliged, and even then I should request you not to tell Mœbius that you intended it for any other person than yourself."

We have to be very cautious in dealing with these people."

"Quite so. But pray allow me to ring for tea. Can I offer you a glass of tea, or do you prefer other refreshment? In a place like this I am obliged to keep what I am likely to want at hand."

"You are most obliging; a glass of tea would be the very thing."

The bell was rung, and a servant in very correct black, with the ordinary white tie, appeared, and "tea" was ordered. After a short pause, to give the man time to disappear completely, the prefect continued,

"You will excuse my asking you the question, I am sure, but I should be very glad to know whether you had any special motives, beyond your well-known and universally respected charity, in adopting the boy?"

"None whatever. I had heard from a friend who lives in the neighbourhood of Riazan of the extraordinary fate of a gentleman connected with one of the best families out there; so, having need of change of air, I went to see my friend, who told me how this gentleman had been disinherited by his father for marrying a girl of low rank, and that this poor fellow had fallen at Plevna, that the mother had died shortly before, and that nobody knew anything about the child. I was greatly touched by the fate of this young boy thus thrown upon the world, and as I had resolved to adopt such a forlorn wail, should Providence ever throw one in my way, I resolved, from a sort of romantic feeling, at once to try in the very neighbourhood referred to by my friend to find the object of my future care, and in the village of Berozovo I actually did find a deserted boy, who had been left to a peasant woman to nurse. She had died, and I found her little charge in the hands of the village priest, from whom I received him, under strict promise of educating him to become my heir. This promise I was performing to the best of my ability when he was taken from me by that rascal Palitzki."

"What has made Palitzki so bitter an enemy?"

"I became possessed of a certain document," said Smirnoff, "and that in a curious way, quite by accident. I had sent a servant to Palitzki's room to ask him for a paper which I had requested him to copy. The man found that Palitzki had left the house, but thinking that this paper might be in one of the drawers of the table, he looked through them, and in the search discovered, not what I wanted, but a paper which he immediately brought to me, and which I found to be a document of a highly compromising tendency, connecting him with one of the dreadful revolutionary societies now existing in Moscow. As soon as I discovered this I went down to Maziellovo, where I found that he had all along greatly neglected the boy, and was a thorough scoundrel."

"Have you that paper now?"

"Certainly. Do you want to have it?"

"I think it ought to be in our custody."

"It is in that chest of cabinet drawers. I have not opened them since I deposited it there. I will find the key and give you the paper. Oh, here is the samovar! Before I look for the paper permit me to pour you out some tea. What do you

take with it? Lemon, cream, cognac, rum, preserves? They are all here."

"Thanks! anything but cream; I am a true Russian, and despise the foreign fad of putting milk into my tea. They say the English invented the custom, which is another reason against my taking it."

A table, on which a cloth of dazzling whiteness was spread, was brought in by a servant, also in black. A silver tea-tray next appeared, on which was a small porcelain teapot, two silver vessels with handles to them, made to hold common water-glasses, so that a person drinking hot tea from the glass would not be likely to burn his fingers. There was a little silver box with a tiny key for sugar, then there were lemons, sundry small decanters of cut glass containing the admixtures for the tea suggested by Smirnoff, and a stand, like a cruet-frame, of jars of jam, for many Russians take preserves in tea.

The great feature of the whole tea equipage was the samovar, or self-boiler. This is a Russian peculiarity, met with nowhere but in the Tsar's dominions. It is an urn, of a shape often seen at ironmongers' and silversmiths', but it differs from the English tea-urn in a very important respect. When we make the tea the water is first boiled in a kettle, and then poured into the urn, where it is usually kept hot by a heater of red-hot iron fitted into the centre cylinder. In the samovar there is no heater, but the central cylinder is a furnace. When a samovar is "set up"—i.e., prepared for tea—a number of shavings are placed at the bottom and ignited; the rest of the cylinder is filled up with charcoal, and a very long tube added, like a chimney, by which means a terrific draught is set up. The charcoal glows and the water boils in an incredibly short time, although it may have been put in cold. As soon as the charcoal is all glowing, and the water violently boiling, the samovar is brought into the room, and tea is made with the boiling water. The water boils as long as there is any charcoal left, for the bottom of the cylinder is lower than the bottom of the actual urn, and where it descends below the vessel there is an open grating which creates a great draught, and keeps the charcoal glowing long after the removal of the iron tube or chimney.

"Before giving you the trouble to look for the document," said Kakaroff, "allow me to ask you how you made the acquaintance of this objectionable student."

"I asked a friend of mine, who is a professor at the University, to recommend me a student to prepare poor little Ivan for the third class in the First Gymnasium, and he sent this man."

"Have you any objection to give me the name of the professor?"

"Of course I must do so if you insist, but it seems hard on him. He was innocent enough in the matter, and only wished to serve me. It would be very mean in me to get him into trouble!"

"He shall not get into trouble. But, you see, we have lost all trace of Palitzki. Perhaps your friend may be able to guide us in our search, but make your mind easy on the score of his safety."

"Many thanks. With that assurance I have no hesitation in saying that my

friend who brought all this trouble into the house was Professor Voldenoff."

A slight change—so slight, indeed, as to be almost imperceptible (it was quite so to Smirnov)—passed over the officer's countenance, but whatever it was or might mean, it was gone almost as soon as manifested.

"Well, now I must ask you another question. This boy, Ivan Dobroff, was a pupil in the First Gymnasium? Of what class?"

"The second; but he is so bright that I had engaged this student to prepare him for the third."

"And yet he was only eleven years old?"

"Certainly not more."

"Clever fellow, evidently. Now, can you tell me whether he had any special friend or 'chum' in his class?"

"Not in his own class, but he formed a very strange friendship with a boy some years older than himself, in the fourth class, quite his opposite in disposition; and, in fact, a greater contrast than that offered by the two boys cannot be imagined."

"Just the very people to become friends. But do you happen to know the name, the patronymic and the surname of this friend?"

"Yes; he is called Pavel Nicolaevitch Abrazoff. He is the son of a wealthy landed proprietor in the Riazan district; in fact his estates lie in Ozoonovo and Berozovo."

"Ha! The very spot from whence your interesting *protégé* comes; is it not?"

"Precisely so, and therefore the whole matter assumes a curious and almost mysterious meaning in my eyes."

"How so? Do you feel inclined to attach any importance to the fact of their both coming from the same district?"

"No, I do not, but it is a curious coincidence."

The prefect of police noted certain points of this conversation, and Mr. Smirnov was about to rise again from his seat to look for the paper belonging to the student, when his attention was arrested by the stamping of horses in the yard; and so he went to the long French window, which opened on to a sort of verandah or balcony, and there he saw, on guard, the two mounted Cossacks who always attended the "general" in his excursions, but who, on this occasion, had come up somewhat late by his especial orders. He smiled at Smirnov and said, "I must apologise for my Cossacks. You see the Emperor has commanded the police masters of the principal towns to be thus specially protected. I do not like the fuss of it, but they are obliged to ride after me; and when I am longer in a house than usual, they come after me and keep watch at the doors. It is a nuisance, but a necessary piece of form. I shall go and dismiss them at once."

Before Smirnov could say a word the general had left the room. Indeed, there was a something about him that was not to be resisted, and Smirnov could no more help yielding to his will than if he had been Fate herself. So he turned his

attention to the cabinet of drawers, secured by doors in front, where the ominous paper relating to Palitzki was. He put the key in the lock, but found, to his surprise, some difficulty in turning it.

"What is this?" he cried; "the lock has been tampered with!"

Again he tried, but with no better success. Irritated at the circumstance, he was about to touch the bell, when the general, of whose approach he was unaware, laid his hand upon his arm, saying as he did so, "Please not to call your servants just yet. I should like to see that paper quite in private, and before any other eyes are set upon it!"

"But I cannot open my drawers; some person has been tampering with the lock."

"Just allow me to try," said Kakaroff, taking the key from Smirnov's hands.

He placed it in the lock, but, like the owner, could not succeed in turning it. He quietly stepped to the window and ordered one of the Cossacks to dismount and enter. The man was standing motionless in the room as soon as the words had passed the lips of the general. He had left his long lance and curiously made whip with his comrade, and now stood like a statue awaiting further commands.

"Open that cabinet, and we will retire to the other room."

"I should like to see the operation," said Smirnov.

"It would confuse him to operate before a stranger. He is perfectly honest; you need not fear for your papers!"

(To be continued.)

A FATAL ELEPHANT HUNT IN CEYLON.

BY AN OLD WESTMINSTER BOY.

hour. The best thing we can do now is to see about dinner, for we shall require a very good one before we can sleep well in this place."

Upon this suggestion I acted at once, rubbing down our tired horses and making them comfortable for the night.

Within half an hour we had the satisfaction of seeing torchlights in the distance, and hearing the welcome "coo-eyes" of our box-coolies and horsekeepers, who had pressed on quickly in order to reach the rest-house before it became quite dark.

We soon got into dry clothes, and sat down shortly afterwards to a dinner of the invariable curried fowl, which is the "Appu's" stock dish at small rest-houses, and the only one which can be made in so short a time. Elastic as the fowls were, we managed to finish one apiece. After the fog-coloured cloth had been removed we felt that life was more worth living than it had been an hour before.

Philip Trevors and I had been sent down to Bintenne by the Commissioners of the Ceylon Woods and Forests to report upon "the extensive felling of ebony and satinwood which it was said was being carried on by the Singhalese in this district."

The low country around Bintenne was at that time so feverish and unhealthy that few Europeans visited the place for more than a day or two at a time.

We had been ordered to stay a week, as it was thought that in that time we could by separating overlook most of the jungle and make inquiries as to the state of the more valuable timber trees.

We had not intended to do any shooting upon this trip, but as we knew that we should most likely see spotted deer and snipe, had brought a gun and an express rifle apiece, with which to be able to shoot anything that might make a change for breakfast or dinner.

We heard from the "Appu" that a small herd of elephants had visited a garden within half a mile of the rest-house only a few nights previously, damaging all the fences and ditches. This was especially annoying, as our rifles were far too light to do much against such large game except at a very short distance. Little did we think then how close that distance was to be!

All the next day we were walking about on the lookout for felled trees. I had but little success as regarded shooting; but upon my return to the rest-house for breakfast, found that Trevors had stalked a spotted deer soon after he left me, and had brought him down with a very long shot.

It had taken six Singhalese coolies to carry him, which they had done by lashing the beast between two saplings with jungle vine. Neither of us had heard or seen anything of the elephants. One of the Singhalese told us that they had been heard of thirty miles off, and that they had then left the district altogether.

The next evening after doing our day's work Trevors and I amused ourselves, down by the side of one of the tanks, by shooting at alligators, but with very little success, it being quite impossible to tell whether the brutes are mortally wounded or not, as they would quickly make under water in any case.

"WELL, I think we have done a pretty good day's ride," said Phil Trevors to me, as we drew up in front of a wretched rest-house near Bintenne. We had ridden over forty miles that day, and both men and horses had done more than enough, without having tasted food since five o'clock that morning.

"Do you think there is a chance of our coolies and boxes turning up before dark?" I asked, having apprehensions about our sleeping in damp clothes in such a feverish place.

"Well," said he, "I have brought my coolies here before, and so I fancy they will know the short cut through the paddy-fields, which will save them seven miles, and so they ought to be up here in about another

Upon the fourth day we started before five a.m., having to visit the skirts of a large jungle track some eighteen miles off, so we both rode, as the ground was fairly level. After jogging along together for some twelve miles we separated, agreeing to meet at a small tank some two hours' walk farther on.

Trevors was to take the path to the right

glimpse of a deer, but I only saw troops of Wanderoo monkeys.

We now halted for a hasty luncheon of some sandwiches which I had brought with me. Up to this time we had not found any trace of timber-felling, and I was inwardly grumbling at our having been sent so far merely upon a newspaper report. It was

was very pleased to think how nicely we must have hit off Trevors's track, as the shots did not sound more than half a mile ahead of us.

I pressed on quickly, wondering what it could be that my friend was firing at, as by the sound of the shot it was evidently from his rifle. Deer could hardly be found late in the afternoon in such unlikely ground as this, but there was no other game, unless he had been shooting peacocks, which I concluded by thinking must have been the case. The jungle became much more scanty as we pushed on, and it was evident that a few hundred yards ahead we should be almost in the open.

A minute later a cry reached our ears, followed by a double shot, and in getting up from a fall over a tuft of thick grass the whole situation burst before me. There was Trevors loading as fast as he could. A large tusker with flesh-coloured scars on his forehead was fifty yards from him, with poor Karuppen, Phil's coolie, between his feet. My Singhaleese coolie ran back into the jungle shouting, "Hora Allia! Hora Allia!" (rogue elephant), at the top of his voice, which indeed was only too evident.

I knelt down and fired two shots quickly from where I was, which was at a distance of over a hundred yards. This was useless as far as killing the elephant was concerned, and was meant to take his attention from the poor man who lay motionless under his trunk. These shots took effect in his temple, and must have caused him great pain, for with a snort of anger he turned and charged towards Trevors, who was almost in the line of fire, and who had never seen me until he heard the report of my rifle.

Trevors had just loaded, and very coolly waited until the elephant was within some twenty yards of him, when he gave him the contents of both barrels full in the forehead. To my horror the beast merely shook his head, and trumpeting with pain and rage, gained on Trevors, who had turned and run as fast as he was able. I was loading with all the haste I could, when my friend called out, "Fire, Jack; fire—with *shot*—anything." But, alas! my coolie had been carrying my gun latterly, and had bolted with it. Trevors had tripped, and was just getting on to his knees, when the elephant was upon him.

Just as I was closing my rifle, the brute laid hold of my friend, who very pluckily cut at his trunk with a hunting-knife, and, as we found afterwards, inflicted upon it a deep gash. Catching poor Trevors round the waist, he lifted him up high over his head, and dashed him on the ground with such a force that he rebounded from the springy grass. I was shutting up and cocking my rifle while this was being done, and then ran close up and discharged both barrels together into the brute's head. This made him leave Trevors, and he turned to me, but it was evident that his end was near, for he tottered as he moved round, and I only retreated a few yards, loading as fast as possible. I now stepped in front of the murderer and fired straight into the hollow between the eyes, when the huge beast fell forward on to his tusks, which were buried deeply into the ground. While in this position I gave him the other barrel, upon which he rolled heavily over and breathed his last.

I ran to Trevors. He did not move. I tore open his shirt, and placed both hands breathlessly upon his heart, but could feel no pulsation. I called out, "Phil! Phil! speak to me!" but no response would come. I lifted him up by the shoulders, and his head fell heavily back. His neck was broken, and he was dead.

I sat down and looked at him vacantly for fully an hour, when, hearing a rustle, I saw my wretched coolie, who had at last returned, guessing rightly that after so much firing it would be safe for him to do so.

We then again examined poor Phil Trevors's

"Taking a good sight, I pulled the trigger."

with one coolie, and I the path to the left with the other. By this means we should be able to judge very well if any extensive stealing of timber had been going on. Our horses were to be tethered where we separated, and our horsekeepers told to expect us back there by four p.m., so that they would have a lazy day. I agreed with Trevors to be at the tank before two, which would allow time for us both to return to the horses by a third route, thereby overlooking the ground as thoroughly as possible.

It was a beautifully cool morning, and had it not been that the leeches were so troublesome I should have enjoyed my walk immensely. As it was, whenever I passed through damp herbage my ankles and legs were covered with the brutes, and were itching and bleeding considerably. I carried my gun and made the coolie I brought with me keep the rifle ready in case I got a

quite evident that no villagers had been through this tract of land for years. There was no sign of any human being, nor were there the remains of any fireplaces, which natives almost always build with a few large stones.

Feeling certain that neither of us would find any traces of stolen trees, I now started off to the right in order to meet Trevors before our appointed time, and to suggest to him that we might spend the next two days in looking out for some better shooting.

My coolie and I trudged wearily along through tangled grass, ferns, and creepers, having every now and then to cut our way with a billhook, as thorny vines caught us round neck, waist, and legs. After having gone some three or four miles, and while stooping a few minutes to pull off some of the leeches from our legs, we heard a shot, followed in about half a minute by another. I

body, which we found quite cold. His neck and spine must have been fractured in several places, from the terrible force with which he had been thrown upon the ground.

The Singhalese then asked after Karuppen, whom I had quite forgotten while looking at poor Trevors lying in front of me—dead. Karuppen we found sitting up with his head between his hands, apparently asleep, but upon our touching him he looked up. He had merely been badly shaken, having been shuffled between the elephant's fore-feet. The brute had been too beside itself with rage to crush him to death as it would have done a few seconds later had not Trevors fired. He had undoubtedly saved the coolie's life, and lost his own instead.

Karuppen told us that as he and his master were passing by a clump of bamboos they heard a crash, and the elephant rushed out upon them; that his master fired, telling him to get behind a tree. The elephant was hurt by the first shot, and took a few seconds to make up his mind whether or not he would come on, but suddenly charged Trevors again, who fired his second barrel and ran among some palms, but then turning sharp round, the beast saw Karuppen, and caught him after a few yards' run through the long grass.

The rest we knew only too well.

We went back to my poor friend's body, upon which flies had already begun to settle, and this made me determine to bury him where he lay. By cutting sharp stakes with our billhooks we managed to dig a grave of some little depth, in which we placed poor Phil's body. His rifle barrel I dented deeply with a large stone, and then broke the lock in order to prevent its being stolen afterwards by natives, placing the trusty weapon under him in the grave.

I could not bring myself to fill in the earth upon him, and so went away for some time, telling the two coolies to replace all the earth in the grave, and then to collect the nearest large stones before they called me. I went over to the dead elephant and examined him. He had large flesh-coloured marks upon his body, evidently the healed scars of wounds received in battles with the males of large herds with which the brute had tried to identify himself, but with no avail. The tusks were very heavy and would prove valuable.

We had both shot badly. The bullet marks on the brute's head were eight or ten inches apart, which showed that both poor Phil and myself had been very shaky from our hot work of breaking our way through the jungle. One bullet placed in the right spot might have brought down the huge beast at once.

But of what avail was all this? Trevors was dead. I went back to his grave and found that they had finished their work, and had piled up a great many large stones. Nothing more could now be done; but as it was so late we decided to stay where we were for the night.

We made what supper we could by cutting out and cooking the elephant's tongue, which was not very palatable, hungry as we were.

I heard my Singhalese coolie narrating to Karuppen, in an undertone, all the deeds that the dead rogue elephant had done—how he had killed a young girl one evening at a well, and how the entire village had turned out and fired regular broadsides into him from their old guns. "But," said the coolie, "it was no use, he bore a charmed life. *Had it not been that I knew this, I would never have run away.*" This last speech made me doubt all the previous part, but whether the story about the girl was true or not—and it was quite possible—I was too disgusted to sit there any longer.

I took my rifle and left the fire, starting off in the direction of the tank where I had arranged to meet poor Trevors. The moonlight was as clear as it could be, close objects being as easily visible as in daylight. Before arriving at the tank, however, the sky became rather misty. Creeping cautiously up to the edge of the pool, and under the shelter of a large jak-tree, I lay down and looked across the water.

I could hear a very slight noise a good way ahead, and wished that the sky would again become quite clear, as, apart from our having no meat for the next day, I felt that I had vengeance to wreak upon the wild animal world to atone for poor Phil's death. Yet it was fair. He and I would have always taken the initiative against a rogue elephant, although in this case we had been acting upon the defensive.

Judge of my surprise when, within ten minutes, I heard a blowing noise, and could just make out three or four large forms in the

misty moonlight, which I knew must be elephants. Whilst peering forward to look at these a louder noise just at one side of me attracted my attention, and gradually the form of a huge tusker came into clear view at the edge of the pool, and near enough for me to have tossed my hat on to his back.

Noiselessly I cocked my rifle, and taking a good rest against the tree, waited a few seconds for him to become quite still, as shooting is so very uncertain by moonlight. It was evident that he sniffed something, and it was lucky that I had taken the precaution of keeping the wind in my face, or no game would have been visible.

This elephant, the leader of the small herd, had been blowing water over himself, but just as he was opposite to me he apparently determined to settle in his own mind once for all whether there was anything uncanny in the breeze or not.

With one foot just upraised from the water, with his ears strained forward and his trunk uplifted, he stood as if made out of ebony, with the moonlight gleaming on his tusks. I looked at him but a second, and taking a good sight midway between his eye and ear, I pulled trigger.

Hardly could I believe my eyes when he fell forward, making a splash in the water that I felt upon my face. He was dead, only showing what luck there is in shooting, when here, by moonlight, an elephant had been killed by a single ball, whereas the one that had killed my friend had received six or eight before becoming disabled.

After examining the dead elephant for some time, and knowing that the sound of my shot had disturbed all the other game at the tank, I returned to the fire, and throwing myself upon a ground sheet, slept fitfully through the remaining part of the night.

It is useless to add much more. Suffice it to say that we stayed at Bintenne only long enough to hire a few villagers to carry the ivory, and I reported myself in Kandy three days afterwards.

Many were the inquiries after poor Trevors, for he was well known in the island, and had been a general favourite from his jolly manner. His friends and many outside planters joined a subscription towards putting up a cenotaph, which now stands in a small up-country church. Thus our trip ended.

I. THE YOUNG SAILOR'S SONG.

How merry is the sailor's life upon the bright blue sea!

I'm sure there's not a lad on shore who does not envy me.

All day to sniff the ocean breeze and far and wide to roam,

Whilst they remain the whole year round cooped up in towns at home.

Or if perchance their lot is cast amid the trees and flowers,

How narrow must their playground be compared to such as ours!

A Life on the Ocean Wave.

They climb a little-hazel tree and proudly look below,

Aloft we sit on mizen-top and watch our glad ship go.

When winds are softly blowing and we skim the summer seas,

How good it is to see the stars like swarms of golden bees;

Polaris, dear to sailors, Aldebaran too our guide,

Mild Pleiades, Arcturus red, and many a friend beside!

When autumn gales are blowing and the decks are never dry;

When waves like thunder roaring surround us mountains high;

When moon and stars are hidden, and the night is long and drear,

In God and in our captain we trust and feel no fear.

Who would not be a sailor skilled in the winds and seas,

Whose paths are in the ocean, whose coursers are the breeze,

Who visits unfamiliar lands, a welcome guest to all,

Who danger scorns and happy lives whatever luck befall?

I love my home and country, and when I lie awake

Would fain be sailing homeward for sweetest mother's sake;

But whilst I live may evermore the sailor's lot be mine,

To sail beneath the Union Jack and sniff the ocean brine!

II. THE OLD SAILOR'S SONG.

A HARD life is the sailor's, boys, mark well an old man's word,

Who tells you what has happened to him, not what he's read or heard;

For fifty years I've trimmed the sail in climates hot and cold,

And twice ten lives I've saved or more, for I was strong and bold.

I've always had a gallant ship and captain
staunch and true;
I fain would give the seaman's life the praise
that is its due;
I've never wanted guineas bright, nor shall I
whilst I live;
I wear three medals on my breast our Queen
was pleased to give.

A pleasant life it is, forsooth, when winds
are blowing fair,
And softly floats the Union Jack upon the
summer air;
And pleasant 'twas to glide along green hills
and flowery lea,
And, oh, how good after long years old Eng-
land's face to see!

But tempests dire a sailor has, and awful is
the sight,
If sight it is when skies and seas are black
with blackest night;

I've seen my comrades snatched by sharks, or
helpless watched them drown,
And many a gallant ship in straits, and more
than one go down.

One vessel left we burning far out in Indian
seas,
And twenty days we plied our raft scorched
by the torrid breeze;
Another lay off Chinese coast for days on
fearful tack,
The monsoon blowing in our teeth, the
pirates at our back.

I never feared a seaman's death, and when
all hope seemed lost
I prayed to God for those at home, and cheer-
ful kept my post;
And now I'm well-nigh eighty, God bless you,
boys, who hear,
Serve God and Queen and country, and hold
your mothers dear.

CANOEES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

V.—A CHAPTER ON SAILS.

SAILS may well occupy our attention now, as in all boats which depend on the wind for their motive power, the nature and form of the sails is of vital importance. You may

perhaps think this wording too strong, and possibly it may be if applied only to the purposes of amusement; but you must remember that business has to be carried on by means of merchant ships, and that the vessels of our navy are in discharge of their duty exposed in every quarter of the globe to the vicissitudes of the elements. And conceive for an instant what it must be, to be on board a fine vessel coming home after a long and tedious voyage, when in the chops of the Channel the wind, which has been freshening up since evening, at daylight blows a whole gale, and with the set of the tremendous sea

fetched up by the gale, backed by the furious wind, which howls and rages through the rigging, the gallant ship, although everything has been done that seamanship can suggest, is slowly but surely drifting on to the rocky coast under her lee.

At such a time as this the question of sails, masts, and rigging is one on which, together with the qualities of the vessel herself, may hang the lives of her crew and passengers. A bad sail, a bad rope, or a bad spar may be the means of the gallant ship being cast, a plaything of the waves, on the rocks, and of the loss of every soul on board. And this goes

told misery to ourselves or others. So let the ropemaker be in earnest as to his rope, and the sailmaker to his sails, and each workman to that which he has to do, glorifying God (who is the Master Workman) in everything that he does and does well. For all bad work is slovenly, evil, and from the Father of Lies. And this applies to the schoolboy as well as to the bricklayer, to the clergyman as well as to the ropemaker, and to all of us who are workers in this busy world.

As you all know, a vessel has to contend with two opposing forces, wind and water, and it is by the utilisation of these forces that it is possible to sail a boat. In a balloon there is only one force to contend with—wind, and the consequence is that the balloon floats about at the mercy of the wind, which carries it as and where it goes itself, and so would the boat be carried if only resting on the surface of the water. For instance, if you place a small toy balloon on a lake in a rough wind, see how quickly it flies down the lake to the lee shore, where the waves are breaking and where the wind is spending its force. This will be the case with a flat-bottomed boat having the sail right in the bows, of which a good illustration is a feather, the curling-up tip representing the sail; but here ease of motion is confined to skimming the surface of the water, for when you go deeper into the water you find considerable resistance, which can be measured at so much per square inch; and so, in proportion to the number of square inches you oppose to the water, so will be the resistance. Now, if your boat or canoe opposes say three square feet to the water when it is pushed along bow first, and offers an immersed surface of thirty square feet when you push it sideways through the water, it is obvious that it is ten times easier for it to come bow first than to go sideways. Now, in going to windward, of which the cutter to appear in the next chapter will give you a very good idea, the closeness with which a craft can sail to the wind depends very much on the relation of the direct or first form of resistance and the lateral or the latter form. If the direct resistance is small and the lateral resistance large, and the sails are flat and stand well and are well trimmed, with a good helmsman, the cutter will go so close up as almost to put the wind's eye out, which, fortunately for the wind, has never been done yet by a sailing-vessel.

Fig. 1.

home to each one of us, for during our lives it may be that some piece of work done amiss, or a word spoken that should never have been uttered, may be the means of un-

Some years ago it was supposed that baggy sails that bellied out to the wind were the most effective, but this has now been found out to be quite a mistake, and so sails are

now made as flat as possible. If a sail were fastened as many boys fasten the sails of their model boats (when I see them I can only suppose they never read the BOY'S OWN PAPER), the mainsail close down to the middle of the stern, and the jib-sheet lashed to the bowsprit, while the fore-sheet is fast

Fig. 2.

to the mast—under such circumstances the only chance the wretched boat has is that the sails be as baggy as possible, as otherwise her only motion would be that of heeling excessively and coming up in the wind alternately.

Now, the boy who has read the articles in the BOY'S OWN PAPER comes along and sees the plight of his friend's craft, and immediately directs him to let out the mainsheet so as to allow the boom room to swing out on the boat's quarter, then to ease off the jib and fore-sheet, and if the boat is a small model tells him that he must have booms on the foresail and jib to allow them to work properly, as the long double sheets leading inboard used to work the jib on a real vessel cannot be managed when there is no one aboard, and with these and other hints the boat is soon swiftly sailing across the pond, showing its owner the qualities that lay hidden under the cramping effects of ignorance. And now, having given you the general principles of sailing, let us see the merits of the different rigs used by canoeists.

The simplest is perhaps Mr. MacGregor's lug, which is shown in the Rob Roy article, and with it hoisted you see on page 174 the canoe gently gliding along over the placid surface of a lake, and the owner indulging in pleasant day-dreams after hard work. This sail is a most useful one, and under the modified form of the balance lug is largely used in sailing canoes and larger sailing boats. Fig. 1 shows a balance lug with Chinese battens. If the lug is required pure and simple, the yard (K K) would be shorter and more peaked—that is, the end at O would be raised more in the direction of P, and the luff (K A) would be shorter. When Chinese battens are fitted, a larger sail can

Fig. 3.

be carried than without, and by an arrangement of lines to bring one batten down on to the other the sail is very easily reefed. The battens are made of bamboo, and are inserted in pockets made by sewing broad tape across the sail. In Fig. 1, D D is the hauling-line for reefing; you will see it divides into three parts, A, B, and C. When past the leading ring on the lower batten each of these parts, A, B, and C, passes through a ring down to the batten below, and on hauling the one line D D the three parts haul the two battens together and thus take a reef.

Note the position of the hauling-line (D D) is incorrectly drawn; it should lead from

the upper batten in a line with the mast and down through the pulley E. Fig. 2 shows another way of reefing. The sail is in this instance a balance lug, but the system

the grummet between the mast and sprit (see Fig. 5). The batwing-sail (Fig. 4) is fitted with three battens, arranged diagonally as sprits; and the lower ends of the

Fig. 4.

of reefing can be applied to any form of rig, and a friend of mine uses it in a small racing cutter of about two tons. The feature in it is the roller in Fig. 3. This roller is shown more clearly at A; B being the standing part or boom proper. There is a metal cap (C), which is secured to the lower boom (B), and in which the roller revolves. The winch (D) is firmly secured to the projecting pintle of the roller through the cap (C), and as the foot of the sail is fastened to the roller, on the hal-yards being lowered and the winch turned the sail reefs up, and *vice versa*. The luff must be cut at less than a right angle with the boom or the sail will jam in rolling. The pin (E), running through the lower part of the winch (D) into C, makes the roller fast where required. In some cases the roller is dispensed with, and the boom revolves on a gooseneck, the sail rolling round the boom itself.

The spritsail is a very handy one, and no sail sets flatter or can be stowed away more quickly. This rig is generally used in sailing barges, and in them you see the enormous sprit towering away far higher than the stumpy mast that supports it. The sprit is the spar that extends triangularly from the peak of the sail to the mast near to the deck. In small boats it is kept in place by a sort of rope grummet called a snorter, but in large boats and barges there is a regular chain and purchase to secure the lower end of the sprit. In taking a sprit from the grummet in a small boat you should be careful not to let go the spar, which would in such a case, the sail being fastened to the upper end, probably drive through the bottom of the boat. As a modification of the sprit I give you a diagram of what I call the batwing sail

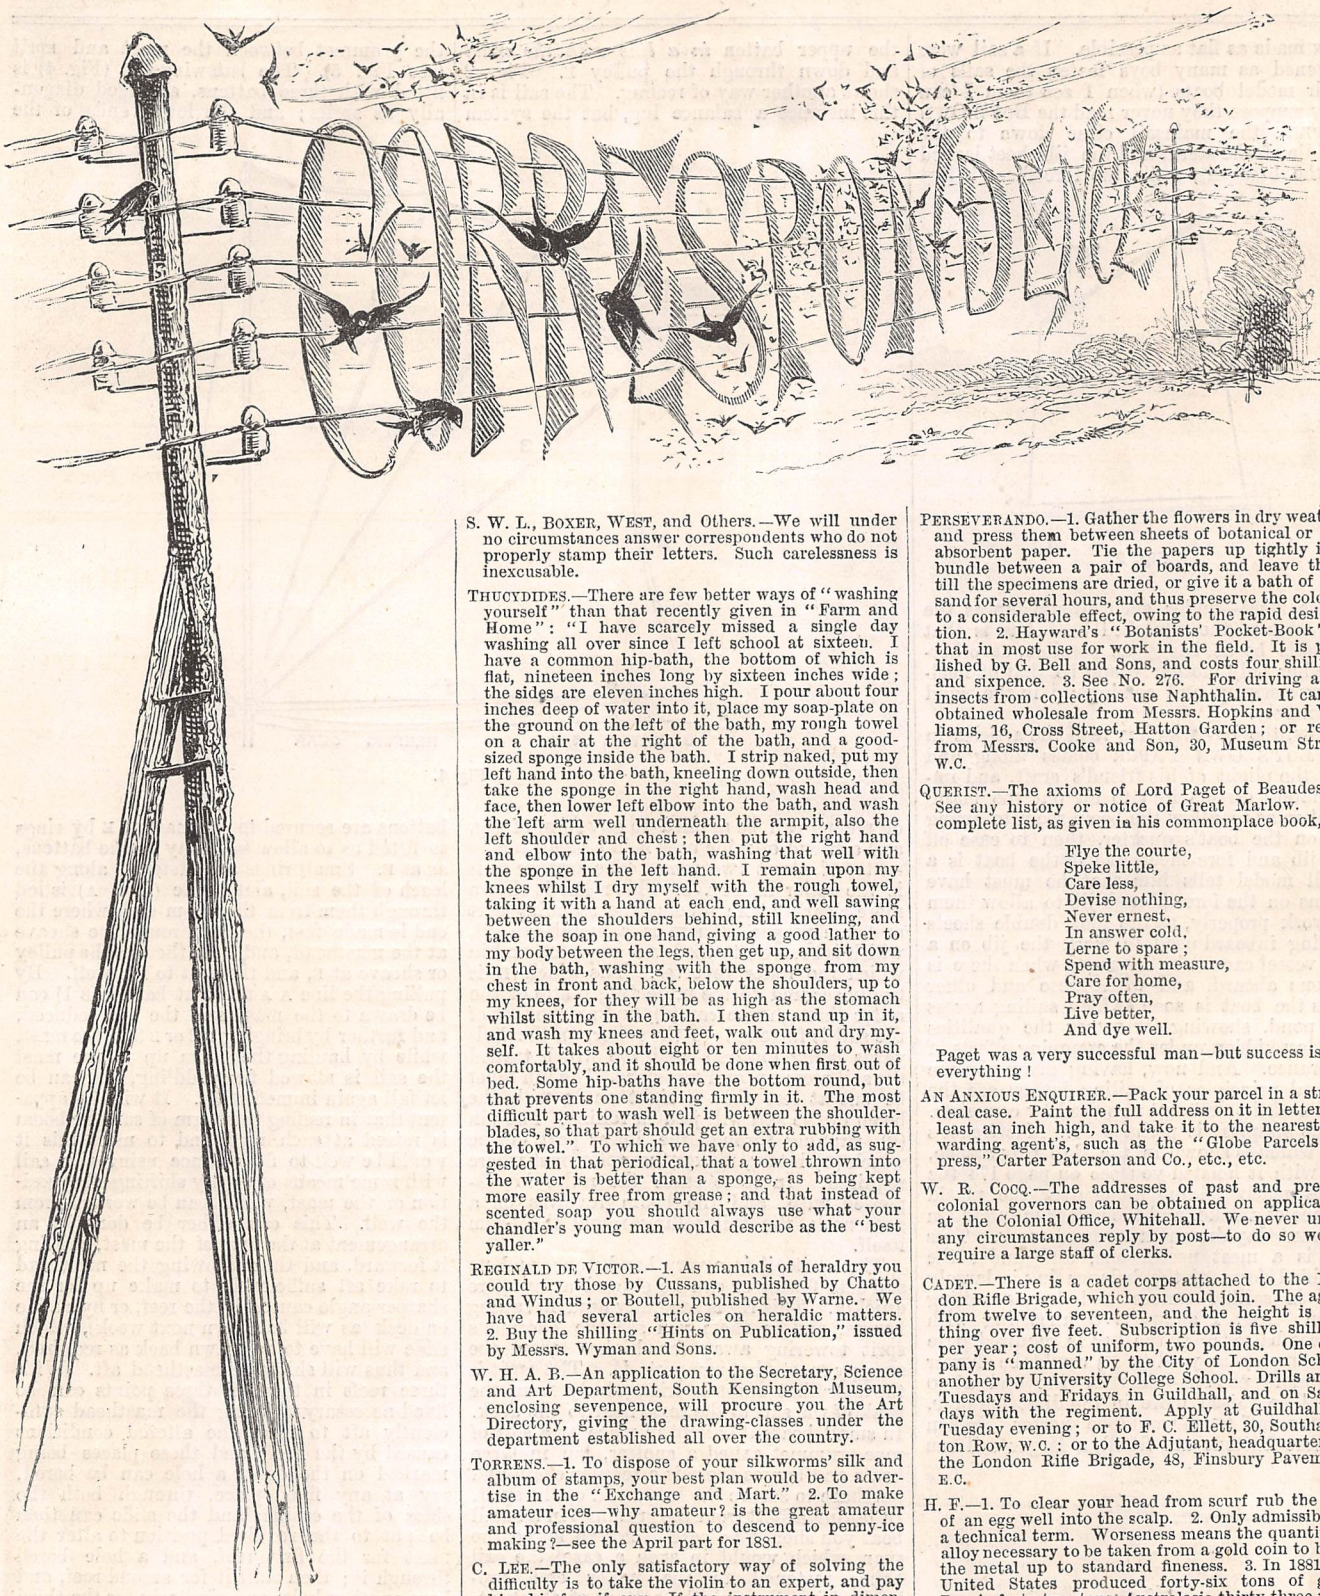

Fig. 5.

(Fig. 4). You will see on this sail there are three sprits (if there were only one, as in an ordinary sprit sail, it would be in the position of B 2, Fig. 4), and the lower end of the sprit secured to the mast by a snorter, which can be made by a grummet large enough to go round the mast, and also to take the sprit end, which is tapered off. A seizing is passed round

battens are secured to the mast at E by rings so fitted as to allow full play to the battens, as at E. Small rings are fastened along the leach of the sail, and a line (A A A) is led through them from the boom end, where the end is made fast, thence through the sheave at the masthead, and from there to the pulley or sheave at E, and then aft to the well. By pulling the line A A the first batten (B 1) can be drawn to the mast and the sail reduced, and further by bringing B 2 or B 3 to the mast, while by hauling the boom up to the mast the sail is stowed for paddling, and can be let fall again immediately. It will be apparent that in reefing this form of sail the boom is raised at each reef, and to meet this it would be well to fit a canoe using this sail with some means of easily shifting the position of the mast, which can be worked from the well. This can either be done by an arrangement at the heel of the mast, shifting it forward, and thus allowing the masthead to rake aft sufficiently to make up for the sharper angle caused by the reef, or by a slide on deck (as will be shown next week), which slide will have to be drawn back as required, and thus will shift the masthead aft. With three reefs in the sail three points can be fixed necessary to bring the masthead sufficiently aft to meet the altered conditions caused by the reef; and these places being marked on the deck, a hole can be bored, say at any fixed place, through both the sides of the casing, and the slide can then be put to the required position to alter the mast for the first reef, and a hole bored through it; then shift it for second reef, and bore another hole, and similarly for the third reef. The one hole in the casing of the slide will answer for all, and a catch at the end of the slide ought to be fixed to allow you to pull it to you easily. The pin used to secure the slide at the reef, passing through the holes, should be fitted with a chain and secured to a ring bolt. It might perhaps be better with this sail to have a couple of other lines, one on either side, from the boom about two-thirds from E, and leading through rings on the battens fastened at about the same distance, and so through a pulley at the mast and down as the other; and the three lines could terminate in one hauling part. The object of the other two lines is to confine the sail more when reefed.

(To be continued.)

S. W. L., BOXER, WEST, and Others.—We will under no circumstances answer correspondents who do not properly stamp their letters. Such carelessness is inexcusable.

THUCYDIDES.—There are few better ways of "washing yourself" than that recently given in "Farm and Home": "I have scarcely missed a single day washing all over since I left school at sixteen. I have a common hip-bath, the bottom of which is flat, nineteen inches long by sixteen inches wide; the sides are eleven inches high. I pour about four inches deep of water into it, place my soap-plate on the ground on the left of the bath, my rough towel on a chair at the right of the bath, and a good-sized sponge inside the bath. I strip naked, put my left hand into the bath, kneeling down outside, then take the sponge in the right hand, wash head and face, then lower left elbow into the bath, and wash the left arm well underneath the armpit, also the left shoulder and chest; then put the right hand and elbow into the bath, washing that well with the sponge in the left hand. I remain upon my knees whilst I dry myself with the rough towel, taking it with a hand at each end, and well sawing between the shoulders behind, still kneeling, and take the soap in one hand, giving a good lather to my body between the legs, then get up, and sit down in the bath, washing with the sponge from my chest in front and back, below the shoulders, up to my knees, for they will be as high as the stomach whilst sitting in the bath. I then stand up in it, and wash my knees and feet, walk out and dry myself. It takes about eight or ten minutes to wash comfortably, and it should be done when first out of bed. Some hip-baths have the bottom round, but that prevents one standing firmly in it. The most difficult part to wash well is between the shoulder-blades, so that part should get an extra rubbing with the towel." To which we have only to add, as suggested in that periodical, that a towel thrown into the water is better than a sponge, as being kept more easily free from grease; and that instead of scented soap you should always use what your chandler's young man would describe as the "best yaller."

REGINALD DE VICTOR.—1. As manuals of heraldry you could try those by Cussans, published by Chatto and Windus; or Boutell, published by Warne. We have had several articles on heraldic matters. 2. Buy the shilling "Hints on Publication," issued by Messrs. Wyman and Sons.

W. H. A. B.—An application to the Secretary, Science and Art Department, South Kensington Museum, enclosing sevenpence, will procure you the Art Directory, giving the drawing-classes under the department established all over the country.

TORRENS.—1. To dispose of your silkworms' silk and album of stamps, your best plan would be to advertise in the "Exchange and Mart." 2. To make amateur ices—why amateur? is the great amateur and professional question to descend to penny-ice making?—see the April part for 1881.

C. LEE.—The only satisfactory way of solving the difficulty is to take the violin to an expert, and pay him his fee, if any. If the instrument in dimensions, curve, and holes is exactly similar to our sketch, it is probably genuine. You will find full-sized diagrams of the *f* holes of the celebrated makers, including those of Bergonzi, on page 105 of "Amateur Work," Vol. I. Write to Ward and Lock for the part containing it, which is published at sixpence.

BILL.—You must scrape off the tar as well as you can, by heating it first, as you see painters doing with doors. Then give a coat of red lead, then one of grey, and then one of white. Or try the paint without removing the tar; it does not always fail.

DUDLEY.—In our second volume you will find articles on model-yacht building, giving full details as to measurements, and comparative lengths of all masts and booms. When hollowed out, the sides of a boat should never exceed a quarter of an inch in thickness.

PERSEVERANDO.—1. Gather the flowers in dry weather and press them between sheets of botanical or any absorbent paper. Tie the papers up tightly in a bundle between a pair of boards, and leave them till the specimens are dried, or give it a bath of hot sand for several hours, and thus preserve the colours to a considerable effect, owing to the rapid desiccation. 2. Hayward's "Botanists' Pocket-Book" is that in most use for work in the field. It is published by G. Bell and Sons, and costs four shillings and sixpence. 3. See No. 276. For driving away insects from collections use Naphthalin. It can be obtained wholesale from Messrs. Hopkins and Williams, 16, Cross Street, Hatton Garden; or retail from Messrs. Cooke and Son, 30, Museum Street, W.C.

QUERIST.—The axioms of Lord Paget of Beaudesert. See any history or notice of Great Marlow. The complete list, as given in his commonplace book, is

Flye the courte,
Speke little,
Care less,
Devise nothing,
Never earnest,
In answer cold,
Lerne to spare;
Spend with measure,
Care for home,
Pray often,
Live better,
And dye well.

Paget was a very successful man—but success is not everything!

AN ANXIOUS ENQUIRER.—Pack your parcel in a strong deal case. Paint the full address on it in letters at least an inch high, and take it to the nearest forwarding agent's, such as the "Globe Parcels Express," Carter Paterson and Co., etc., etc.

W. R. COCQ.—The addresses of past and present colonial governors can be obtained on application at the Colonial Office, Whitehall. We never under any circumstances reply by post—to do so would require a large staff of clerks.

CADET.—There is a cadet corps attached to the London Rifle Brigade, which you could join. The age is from twelve to seventeen, and the height is anything over five feet. Subscription is five shillings per year; cost of uniform, two pounds. One company is "manned" by the City of London School, another by University College School. Drills are on Tuesdays and Fridays in Guildhall, and on Saturdays with the regiment. Apply at Guildhall on Tuesday evening; or to F. C. Ellett, 30, Southampton Row, W.C.; or to the Adjutant, headquarters of the London Rifle Brigade, 48, Finsbury Pavement, E.C.

H. F.—1. To clear your head from scurf rub the yolk of an egg well into the scalp. 2. Only admissible as a technical term. Worseness means the quantity of alloy necessary to be taken from a gold coin to bring the metal up to standard fineness. 3. In 1881 the United States produced forty-six tons of gold, Russia forty-two tons; Australasia thirty-three tons, Spanish America ten tons, and the rest of the world six tons. Total production, 137 tons; value £19,520,000.

ARTIZAN.—The catamaran would hold two with perfect safety. You can get a list of books on smiths' work by applying for catalogue to either Messrs. Lockwood and Co., Stationers' Hall Court; or Spon, Charing Cross.

COD'S HEAD.—The "silver" on the copper knob is quicksilver, and there is no difficulty in getting it to stick on.

C. BARRON.—See our chapters on knotting and splicing in the second volume.

PUTNEY.—As a first book on the subject, try Professor Fawcett's "Political Economy," published by Macmillan and Co.

ZWEI RHEINLAENDER.—We never recommend particular machines. A shilling book is published by L. U. Gill, at 170, Strand, called "Tricycles of the Year," which contains cuts of the latest novelties, and from it you could choose.

A. N.—For list of lathes, apply to the Britannia Company, Colchester; or Churchill and Co., Sun Street, Finsbury.

H. MILLER.—The articles on camping out on the Thames from Oxford to Putney were in the third volume—in the August, September, and October parts for 1881.

LAMP-POST.—The only way of obtaining a single coloured plate is by buying the sixpenny part containing it, and this will cost you sevenpence post free. By ordering it from your bookseller you save the penny.

** Every reader should endeavour to secure a copy of our CHRISTMAS NUMBER. We have still a few copies left of the SUMMER NUMBER, which may be obtained by order through any bookseller, price 6d.

No. 311.—Vol. VII.

SATURDAY, DECEMBER 27, 1884.

Price One Penny.

SCHOOL AND THE WORLD :

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

PART II.

CHAPTER XVII.

A MERRY Christmas! To most of the boys released from St. Mary's it was merry enough; parties, skating, and the

"Take it up to Mr. Lang's room."

rest of the enjoyments of the season, made the time pass only too rapidly; before the month was out the approach of school-time again made itself felt as an undefined horror in the distance. But there was one boy who had a far from merry time of it, and that was Lang.

What a hypocrite he felt. His father showed some annoyance at his not having brought home a prize, and he was obliged to explain it by saying that the special work he had to do for the examination had taken away his chance of gaining the ordinary school honours. He could not enter into the festivities of the season; he was a wet blanket on all the gaieties of his brothers and sisters; he could not enjoy himself, and at last he gave up trying.

"I don't think I'll come downstairs much, if you don't mind, mother," he said, one day. "I can work a great deal better in my own room; those youngsters kick up such a row."

"You are sure you're not working too hard?" asked Mrs. Lang, anxiously.

He laughed uneasily.

"Don't you be afraid of that, mother," he said. "I shan't kill myself by over-work."

So in future he stayed in his own room, where he had a fire made. He was glad of the excuse to get out of sight of his father and mother. He locked his door and tried to amuse himself with reading novels, but they had lost their charm. The only occupation which gave him any sort of satisfaction was working hard at the subjects for his exam, useless though his labour would be. But it was a sort of salve to his conscience.

Soady thought he might give himself a holiday for a week, so he put aside his books and threw himself into the fun which was going on around him. He had a try at the music which Tommy gave him, but after spending an hour at the first half page he gave it up for the present.

"It's too thick for me just now," he said to himself. "I must have a grind at it when I've a week to spare straight off."

However, his sister got hold of it, his younger sister Belle. She was a precocious girl in the eyes of Soady, who had a great deal of trouble in keeping her in what he considered her proper place. She had different ideas as to what was her proper place.

"Why, Dick! Where on earth did you get this?" she asked. "Who has been making fun of you?"

"It was a present," replied Soady.

"What was her name?" asked Belle, maliciously.

"Her name was Tommy," replied Soady, gravely; "her name wasn't Belle."

"I suppose you mean I don't give you presents?" she retorted; "never mind, you shall have something on Christmas Day."

"Don't be too generous, Belle."

"No, I won't. I'll try and get something that shall be simple—something that will suit your character and accomplishments."

"Little girls mustn't try and be witty," said Soady.

"Why not? They've more chance of succeeding than little boys," cried Belle, as she ran away to get ready to go to decorate the church.

Soady accompanied his sisters to give

them the benefit of his help and advice. But he did not shine as a decorator; his ideas of arrangement and design were not received with due respect; he pricked his fingers woefully with the holly, and finally he gave it up and sat down in a pew to listen to the organ, which some one was playing.

Then he thoroughly enjoyed himself. The organist played several carols, and then a part of the Messiah. He was quite sorry when the girls came to tell him they were going. At the same instant the organ stopped.

"Where's Belle?" he asked, as he rose and tried to find his hat.

"Here she is," said Ethel, his elder sister. The door leading to the organ-loft opened, and Belle appeared, followed by a small boy, who was red with his exertions as the blower.

"Who's been playing?" asked Soady.

"Jimmy Burns," replied Belle, with a toss of her head, pointing to the urchin. "He has a beautiful touch on the bellows."

Soady looked at her in astonishment. He began to realise the fact that Belle, whom he had always regarded as a child because she was a year younger than he, was almost a young woman now, and must be treated as such.

"Why, Belle, I had no idea you could play like that!"

"Oh, your ideas want correcting on a lot of subjects," she said. "We shall make something of you some day, though, now that you've left that horrid school where they taught you nothing but rubbish."

Soady could not be angry with her after giving him so much pleasure, so he made no attempt at a retort. However, he secured a revenge in the evening, when they had various games, at which he unostentatiously laid himself out to defeat her, and managed it to his complete satisfaction. When Christmas morning came, however, Belle again scored, for her present to him consisted of the scales for the piano, properly fingered.

The day passed happily. When it was gone, Soady resolved that he must eschew pleasure for the present and give himself up to work. It was not worth while to risk being a place lower in the list for the sake of a few days' idleness. So till evening came round he shut himself in the library, and abstracted his thoughts as far as possible from what was going on in the other part of the house.

CHAPTER XVIII.

CHRISTMAS had been gone a fortnight, and the matriculation was now near at hand. Lang had obtained his father's consent to go to London in order to spend the last few days under a coach. In reality, he wanted at any cost to be away from home. He could not bear to have his mother's eyes on him; he felt he was deceiving her, and feared in spite of himself that his deception would be discovered.

He was to live for the present at a boarding-house near Euston, from whence it was an easy walk to the tutor's house. Not that he intended attending there more than he could help; he feared his ignorance might be discovered.

He wrote to Fanshawe to inform him

of his coming. Much as he would have liked to have thrown him over altogether, he yet felt a sort of relief in seeing him. Fanshawe knew all about the terrible secret which was oppressing him and rendering his life miserable; it was a relief to have some one to whom he could talk freely, even if that some one were Fanshawe.

"Hullo, Lang! here you are, then!" was Fanshawe's greeting, as he met him at Euston. "Where's your luggage?"

Lang pointed to his Gladstone bag, which was all he had brought.

"Come along, then; here's a cab; I suppose we must have one; it won't do to make your first appearance carrying your own luggage."

They were soon on their way to Lang's temporary home. Fanshawe jumped out first and gave a tremendous knock, pulled out the bag, and handed it to the servant, with strict instructions not to open it or let it fall.

"Shall I take it up to your room, sir?" asked the boy in buttons who acted as footman, porter, and factotum of the establishment.

"No, Tommy; I'm sorry I'm not going to have the pleasure of patronising this mansion just yet. Take it up to Mr. Lang's room, and give his compliments to Mrs. Turner and say he is going to spend the evening with a friend and won't be back till late."

He pushed Lang back into the cab, gave a fresh direction to the cabman, and then jumped in.

"Where are you going?" asked Lang. "I ought to go in and speak to Mrs. Turner."

"You won't find that much fun," said Fanshawe. "Come to my rooms for a bit, and then we'll go out somewhere. 'Twould be a pity not to take our shilling's worth out of the cab, and we haven't gone two hundred yards yet."

Fanshawe lived in a street off the Hampstead Road, a part quite unknown to Lang. When they reached the house he was careful to open the door with his latch-key before paying the cabman, foreseeing pretty accurately that the shilling he offered him would scarcely be accepted without a protest. However, the door was shut behind him before caddy could give vent to his indignation.

"Listen!" said Lang, as he stood in the passage; "he's going to summons you."

"All right; let him. He'll think better of it before morning; 'twon't be worth his while. I know the way to manage them by now. Come along. Don't tumble over the mat."

Before he followed Lang upstairs he shouted down the kitchen stairs. A woman's voice cried back,

"Well, what do you want?"

"Let's have some tea, Mrs. Gunter, for two, please; and some muffins, or something."

Lang did not catch the reply, which was in a grumbling tone, but climbed up the carpetless stairs. He could not help thinking that for a fellow of Fanshawe's pretensions the house was not quite so nice as he would have expected.

"Here we are!" said the host, as he pushed open a door on the second floor. "Fire nearly out! That slavey is the stupidest idiot outside a lunatic asylum! Help me hold up this paper."

He spread a newspaper in front of the fire to draw it up. It was monotonous

to hold it, so they fixed it up with the poker and shovel.

"Take your overcoat off," said Fanshawe; "you'll find a chair somewhere. Bother that fire! It's out, I do believe."

He opened the window to let in more air. The current drove the paper into the coals, and in a moment a corner of it caught fire.

"Look out!" he shouted.

They both made a rush for the grate, but it was too late. With immense rapidity the newspaper blazed into a mass of flame, which they had hard work to keep from setting the chimney on fire. However, the fire had caught up, so that they had a pleasanter prospect before them when the blacks began to cease falling on everything.

The tea was not a great success, and Lang, who was hungry, wished he had something more substantial to attack than weak tea and burnt muffins. The meal was brought up by a dirty servant, who grumbled when told to bring some hot water, and who took no notice of the bell when they rang for more butter.

"This is rather a hole," said Fanshawe, apologetically; "but it's cheap, and I'm rather up a tree just now. That trifle you're going to advance me will come in useful. I s'pose you don't happen to have it with you?"

Lang had not; he had a few pounds only, as his account at the boarding-house would be sent to his father, who would also settle with his coach direct. However, he could not well refuse to let Fanshawe have a sovereign, which he handed to him, though none of the money was yet due.

"Now then," said Fanshawe, in a cheerier tone, when the last of the tea-things were cleared away, "we can make ourselves comfortable. There are plenty of pipes on the shelf, and tobacco in that jar, and I can give you a drop of something better than Mrs. Gunter's tea. Pull up to the fire."

Lang did so, but refused the pipes; he had some cigarettes in his pocket, which he felt were safer for him at present. He hoped, foolish boy, to rise to the dignity of a pipe by-and-by; just now he fought rather shy of them, having in his recollection a certain unpleasant experience of the previous week, which he was not anxious to repeat.

The room was warm and cosy; Fanshawe was an interesting and amusing companion, and Lang began to feel more at his ease than he had done for some time. It was a sort of satisfaction to know that here at least he need not play the hypocrite. Fanshawe was his accomplice, there was nothing to conceal from him. He smoked his cigarettes and sipped the decoction which his companion produced, and was soon in better humour than he had been for a long time, laughing loudly at Fanshawe's stories, some of which were not at all to his credit. But Lang had not yet arrived at the honourable condition when one is critical as to what one hears.

Before long they began talking of old school days, fought over again the old football fights, and brought back to memory the various escapades in which they had been engaged together.

"Lucky we weren't caught that time," said Fanshawe, speaking of a more than usually wild adventure. "I guess that would have closed my career rather earlier. The Doctor was always down

on me; he looked on me as a sort of model bad boy, an awful example, like the drunken Helot. You were luckier, he seemed to think you were corrupted by me."

"So I was," laughed Lang, feebly.

"Yes, but you were reformable. I suppose you became a prime favourite after I left."

"I?" cried Lang. "Why, he isn't certain now that I'm not a thief, though he is good enough to give me the benefit of the doubt!"

"What on earth are you jawing about?"

"I forgot you didn't know," replied Lang, half regretting that he had spoken. It was no good spreading abroad the knowledge of his disgrace, undeserved though it was.

"Haven't heard a word about it," said Fanshawe. "Fire away."

"Oh, it's no good bothering you with it."

"I should like to hear it. What a beast the Doctor must be!"

Lang did not like to refuse now; it would look as if he had something to conceal. So he told the whole story to him, waxing eloquent over his wrongs, and not sparing epithets whenever he mentioned the Doctor.

"Well, that is a swindle," was Fanshawe's comment when he had finished. "Does your pater know anything about it?"

"No! not that there's much to tell, though; there's been no accusation you see."

"No, only a suspicion, which is sometimes harder to meet. So Melhuish is at the bottom of it all, you suspect!"

"Yes, I think so. I suppose you've seen nothing of him since you were down at St. Mary's for the match?"

"No, worse luck! I wish I could get sight of him; I'd make him pay up what he owes me."

"You won't say a word about this to any one, will you?"

"Of course not, old boy; you don't think I'm that sort, do you?"

(To be continued.)

CHESS.

(Continued from page 176.)

Problem No. 90.

By J. C. WEST.

White to play, and mate in three (3) moves.

A GAME

played in London in October, 1884, between J. A. W. H. (White), and H. F. L. M. (Black).

The opening is named after the third move, P to Q B third, and is that kind of the K's game which is called "THE ENGLISH GAME."

WHITE.

1. P-K 4
2. Kt-K B 3
3. P-B 3
4. P-Q 4
5. P x P
6. B-K 3 (a)
7. P x B
8. Kt x Kt
9. K-K 2 (b)
10. K-Q 3
11. K x Kt
12. Q-Kt 3
13. B-B 4 (d)
14. B x P
15. B x K B P (ch.)
16. R-K B sq.
17. R-B 4 (e)
18. R-B sq.
19. Q-B 2
20. Kt-Q 2
21. K-Q 3
22. Q x Q
23. B x B
24. K-K 4 (f)
25. Kt x R
26. Kt-Kt 3
27. B-K 6
28. Kt-B 7 (ch.) (g)
29. Kt-B 5 (ch.)
30. B-Kt 3
31. Kt-Q 4

BLACK.

- P-K 4
- Kt-Q B 3
- Kt-B 3.
- Kt x K P
- B-B 4
- B x B
- Kt x K P
- Q-R 5 (ch.)
- Q-B 7 (ch.)
- Q x Q Kt P (c)
- Q x R
- Castles
- P-Q 4 (ch.)
- P-Q B 3
- K-R sq.
- P-Q R 4
- P-K Kt 4
- P-R 5
- B-K 3
- B-Q 4 (ch.)
- Q x R P
- B x Q
- Q-R-Q sq. (ch.)
- R x R
- R-Q 8
- R-Q 7
- P-R 6
- K-Kt 2
- K-B 3.
- R-Q Kt 7
- P-B 4

and after a few more moves White resigned.

NOTES.

(a)—If Q-Q 5, then B x P (ch.). 7, K-K 2, P-B 4. 8, P x P (in passing), Kt x K B P. 9, Q-K Kt 5, Q-K 2 (ch.). 10, K-Q sq. (the K must not take the B, as the Kt would check and win the Q), Castles, and Black stands best. It would be bad for White to continue 11, B-Q B 4 (ch.), P-Q 4. 12, B x P (ch.), Kt x B. 13, Q x Kt (ch.), B-K 3. 14, Q-Q Kt 5, Q-R-Q sq. (ch.). 15, B-Q 2, R-B 4, etc.

(b)—He should rather have moved the Kt's P, and if Kt x Kt P; 10, Kt-B 3, etc.

(c)—Better to have checked with the Kt, as it would have exposed the adverse K to more checks.

(d)—White thought afterwards he might have tried Kt x B P, threatening mate in three moves by Kt-R 6 (double check), Q-Kt 8 (ch.), and Kt-B 7 mate,—but there would have followed 13,—P-Q 4 (ch.). 14, Q x Q P, B-B 4 (ch.) (see *). 15, K x B (or **), Q x Kt (ch.). 16, K-K 5 (if B-Q 3, then Q x R), Q-K Kt 3, and wins, for if B-B 4, then Q-R-K sq. (ch.), K-Q 4, and Black mates in two more moves.

(*)—Not 14,—Q x Kt (ch.), which would lead to an even game, thus: 15, B-Q 3, B-B 4 (ch.). 16, K-B 4, B x B. 17, R x Q, B x R. 18, K-Kt 5, R x Kt. 19, Q x P, R-K sq. 20, Q x B, etc.

(**)—15, Q x B, Q x Kt (ch.). 16, B-Q 3, Q x R. 17, B-B 4, Q-Q Kt 8 (ch.). 18, B-Q 3, Q x P, and Black wins.

(e)—He would have won the Q and the game by Kt-Q 2; but he attempted Kt-Kt 6 (ch.) and R-R 4 mate.

(f)—K-K 2 would have lost, because of R x Kt (ch.), but he should have played K-B 4 in order to stop the R's P.

(g)—K-B 3 would at least have secured a draw. Black gets the B for the Q R's P, and should he take the four white Pawns, then the two Kts, on an otherwise clear board, cannot win.

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XI.—THE STAR DISAPPEARS.

THE news of Vandergaart's return promptly spread. Visitors to the farm soon began to arrive in crowds to gaze upon the wonder of the kopje. They were not long in learning that the

Star on a pad of cotton wool, and placed it on the top of a small white marble column in the centre of the mantelpiece in his parlour. There the whole day long did he remain seated in

The crowds could not but increase during the following days, and the fame of the Star of the Settlement extended beyond the boundaries of the district to the most distant towns. The colonial journals devoted article upon article to its dimensions, its figure, its colour, and its brilliancy. The telegraph cable from Durban carried its details by way of Zanzibar and Aden to Europe and Asia, and on to America and Australasia. Photographers begged to be allowed to take the portrait of the marvellous gem; special artists came from the illustrated journals to reproduce its image; in fact, the event became of world-wide celebrity.

And of course legend began to weave its web round the stone. Stories began to circulate among the miners of its mysterious properties. With bated breath they told how a black stone must necessarily bring bad luck. Practical men shook their heads, and vowed they would rather Watkins have the stone than they should. In short, calumny, without which celebrity cannot exist, did its unenviable duty with the Star of the Settlement, and the Star very naturally was in no way troubled thereby, but continued to pour forth its brilliant rays on its obscure detractors.

Watkins, however, was much more sensitive to them. The gossip exasperated him. It seemed as though it depreciated the value of the stone, and he resented it as a personal insult. When the governor of the colony, the officers of the neighbouring garrisons, the magistrates, and all the high functionaries had done homage to his jewel, it seemed to him that such depreciatory comments was little less than sacrilege.

To create a reaction against this silly trash and to gratify his weakness for the pleasures of the table he resolved to give a grand banquet in honour of his cherished diamond, which, notwithstanding what Cyprien had said and Alice wished, he still dreamed of converting into coin.

Such, alas! is the influence of the stomach on the feelings of many men, that the mere announcement of the dinner effected quite a revolution in the opinion of Vandergaart Kopje. Those who had been most conspicuous in maligning the Star now changed their game, and confessed that after all the stone was innocent of the noxious influences they had ascribed to it, and that an invitation from Mr. Watkins would be thankfully received.

Long will the fame of this dinner continue. Eighty guests sat down in a tent pitched along one side of the parlour, the wall of which had been removed for the occasion. A baron of beef occupied the centre of the table, and around it were samples of all the game in the district. Mountains of vegetables and fruit, and gallons of beer and wine, were the chief features of this truly pantagruelian repast.

Taking the Portrait of the Marvellous Gem.

diamond belonged to Miss Watkins, and that her father was its real owner. Hence a considerable increase in the public excitement.

It may be mentioned that the artificial origin of the stone had been kept very quiet. The Griqualand miners were not so ill-advised as to noise abroad a secret that might ruin them. And Cyprien, unwilling to trust to chance, had made up his mind to say nothing and to keep back his memoir until by a second experiment he had verified his facts. What he had done once he wished to be sure he could do again.

Public curiosity, then, was highly excited, and John Watkins could not with decency decline to gratify it. Greatly was his vanity flattered. He laid the

his arm-chair, admiring the incomparable jewel and exhibiting it to the public view.

James Hilton was the first to throw out a hint as to the imprudence of these proceedings. Had Watkins thought of the danger he was running in exhibiting to all comers a gem of such value? Ought he not immediately to send off to Kimberley for a special police guard? That very night perhaps might not pass without something occurring.

Watkins was rather scared at these warnings. He hastened to follow the judicious advice, and breathed very much more freely when towards evening a squadron of mounted police put in an appearance. These twenty-five men were put up in the outhouses of the farm.

The Star of the Settlement, placed on its pedestal and begirt with lighted candles, presided, behind John Watkins, at the festival given in its honour.

Twenty Kaffirs officiated as waiters under the directions of Matakai, who was lent by his master for the occasion.

Besides the police, of whose services Mr. Watkins thus showed his appreciation, there were present all the chief personages of the camp and its neighbourhood. Mathys Pretorius was there, and so were Nathan, James Hilton, Pantalacci, Friedel, Steel, and fifty others.

And even the dogs—and, above all, the ostriches—took part in the festivities and came in to beg during the meal.

Alice took the end of the table opposite to her father, and did the honours with her accustomed grace, but not without secret chagrin, for neither Cyprien nor Vandergaart was present, and she well knew the motives of their abstinence.

The engineer had from the first avoided as much as possible the society of Friedel, Pantalacci, and their particular friends; and now, since his discovery, he was well aware of their anything but good wishes towards him, and even of their threats against the inventor of the process that would eventually ruin them. He therefore excused himself from appearing at the dinner. To Vandergaart Watkins had made the most urgent offers of reconciliation, but the old lapidary had rejected them with scorn.

The banquet approached its end. Thanks to Alice's presence, the boisterous spirits of the diners had been happily somewhat restrained. Watkins arose, rested both hands on the tablecloth, and began the speech of the occasion.

"This day," he said, "is the greatest day of my colonial life. After the trials and struggles of my youth, to see myself here in wealthy Griqualand, surrounded by eighty friends assembled to do honour to the greatest diamond in the world, is a pleasure I shall never forget. It is true that to-morrow one of our honourable friends may find a bigger stone! That is the beauty and poetry of a digger's life! (Cheers.) I wish you may have such luck! (Laughter and cheers.) I do not hesitate to affirm that it would be difficult to satisfy the man who in my place would not declare himself satisfied. But to conclude, I invite you all to drink to the prosperity of Griqualand and a rising diamond market—notwithstanding all that may have happened—and a happy voyage to the Star of the Settlement down the country, round the Cape, and home, I hope, to England."

"But," said Steel, "won't there be some danger in sending a stone of such value down to the Cape?"

"Oh, it will be strongly escorted!" replied Watkins. "Lots of diamonds have gone the same road in safety."

"Even that of Durieux de Sancy," said Alice; "although, had it not been for the servants' devotion—"

"Eh!" said Hilton; "what was that?"

"The anecdote runs," said Alice, "that De Sancy was a French gentleman of the court of Henry III. He owned a famous diamond, still called after him. The diamond had already been through some remarkable adventures. It had belonged to Charles the Bold, and he was wearing it when he was killed under the walls of Nancy. A Swiss soldier found it on the Duke of Burgundy's corpse, and sold it

for a florin to a poor priest, who parted with it for five or six florins to a Jew. At the time it belonged to De Sancy the royal treasury was in difficulties, and he consented to put the stone in pawn to raise funds for the king. The money-lender at the time was at Metz, and De Sancy entrusted the jewel to one of his servants to take it there. 'Are you not afraid that the man will run away with it to England?' people asked. 'I am sure of him!' was the answer. In spite of this assurance neither the man nor the diamond arrived at Metz, and the court made great fun of De Sancy. 'I am sure of my servant,' he persisted. 'He must have been assassinated!' And in fact, when a search was made, the man's body was found in a ditch by the roadside. 'Cut him open!' said De Sancy; 'the diamond ought to be in his stomach!' They did as he ordered, and it was found to be so. The humble hero, whose name is unknown to history, had been faithful to death to his duty and honour, 'outshining,' as the old chronicler says, 'by the splendour of his deeds the splendour of the jewel he carried!' I shall be very much surprised," said Alice, as she concluded her story, "if the Star of the Settlement does not inspire some

to render homage to the incomparable gem.

The Star had disappeared.

The astonishment on the eighty faces was so manifest that the amphitryon turned sharp round to see what was the matter.

He fell back in his chair as if thunder-struck.

They crowded round him, loosened his cravat, dashed cold water over his face—and he soon came to.

"The diamond!" he roared. "The diamond! Who has taken the diamond?"

"See that no one leaves the room," said the chief of the police, ordering his men to the doors.

The guests looked at each other in dismay, or spoke in whispers. Not five minutes before all of them saw, or thought they saw, the diamond in its place.

"I propose we shall all be searched before we leave the room," said Steel, with his usual frankness.

"Yes! Yes!" replied the company, seemingly unanimous.

The suggestion gave Watkins a ray of hope.

The police officer drew up the guests

"Grouped round a fire outside."

similar instance of devotion during its travels."

The sentiment was received with loud acclamation, eighty arms lifted high an equal number of glasses, and all eyes turned instinctively to the mantelpiece

along one side of the room and began to search himself to begin with. He turned out his pockets, took off his boots, and patted his clothes in the customary professional manner. Then he proceeded to search the guests in similar fashion, and

then one by one they passed before him and were subjected to a more minute examination.

The investigation produced no result.

"If you will let me," said Mataki, "I will try."

The offer was immediately accepted. The guests formed a circle round the

"What bosh! He can easily do Mataki by cutting off three inches, so as to counterbalance the lengthening he is afraid of."

"That is what the medicine man is hoping for, perhaps, so as to catch him on the hop."

However, the quarter of an hour elapsed, and Mataki beat the tom-tom and called in his compatriots. They all returned and handed back their sticks. Mataki formed a bundle of them, and found them all of the same length. He was going to put them on one side and declare that the honour of his friends was cleared, when he bethought him of measuring the bundle with the stick he had retained for himself.

He did so, and all the sticks in it were three inches short!

The Kaffirs had judged it best to provide against the lengthening, which, to their superstitious minds, was far from improbable.

A general shout of laughter saluted this unexpected result. Mataki seemed quite humiliated that this method, whose efficacy he had frequently proved in his kraal, should turn out a failure in civilised life.

"We must give it up for the present," said the police officer to Watkins, who was seated in his arm-chair, plunged in despair. "We may do better to-morrow if we offer a good reward for information that may put us on the track of the thief."

"The thief!" exclaimed Pantalacci. "And why should he not be the man who was trying his comrades just now?"

"What do you say?" asked the officer.

"Why, Mataki, who played the medicine man to divert your suspicions."

Had Mataki been noticed at this moment he would have been seen to make a curious grimace and hurriedly leave the room and run inside his hut.

"Yes," continued the Italian, "he was with his companions waiting on us during the dinner. He is a thorough cheating scoundrel! and why Mr. Cyprien has taken a fancy to him no one can make out."

"Mataki is honest; I will answer for that," said Miss Watkins, eager to defend Cyprien's servant.

"Eh! How do you know?" exclaimed the farmer. "Yes, he is quite capable of laying hands on the Star!"

"He cannot be far off," said the police officer. "We can soon search him."

An instant later Mr. Watkins and his guests were at Mataki's hut. The door was fastened. It was broken in.

Mataki was not there, and they waited for him in vain throughout the night.

Nor did he come back next morning, and it seemed certain that he had fled from Vandergraart Kopje.

(To be continued.)

"Mataki was not there!"

Every nook and cranny in the place was then carefully pried into. Not a trace of the diamond was discovered.

"There are the Kaffirs who were waiting on us!" said the police officer, who did not yet like to own himself defeated.

"That is so!" was the reply. "The Kaffirs are quite thieves enough to have done it!"

The waiters had, however, gone out just as Watkins began his speech, and were now grouped round a fire outside making merry with the scraps of the meal that had been reserved for them. Their guitars made out of calabashes, flutes blown by the nose, and tom-toms of different kinds, had already commenced that deafening cacophony which precedes the musical manifestations of the natives of South Africa. The Kaffirs hardly knew what to make of it when they were brought back and searched in their scanty garments. And the search was as useless as all that had gone before.

"If the thief is one of the Kaffirs—and he ought to be—he has had quite time enough to clear off," remarked one of the guests, very sensibly.

"That is so," said the police officer; "and there is perhaps only one way of finding him out, and that is to apply to one of the native medicine men. That might succeed—"

natives, and Mataki, thoroughly accustomed to the work, began the ceremony.

He first breathed upon two or three pinches of tobacco, which he took from his pouch, and said,

"I will now try the wands."

He then stepped to a neighbouring bush and cut off a score of twigs. These he measured very carefully and cut them all down to the same length of about twelve inches. Then he distributed them one to each Kaffir, keeping one for himself.

"Now you can go away where you like for a quarter of an hour," said he, in a solemn tone, "and you will come back when you hear the tom-tom! If one of you is the thief his wand will be three inches longer than the rest."

The Kaffirs dispersed visibly affected by this little speech, knowing well that according to the summary proceedings of Griqualand justice they could be tried and hanged in a few minutes without a word being heard in their defence.

The guests, who had been much interested in the scene, were naturally impressed by it according to their different dispositions.

"The thief need not come back at all," objected one.

"Well, then, that would show who was the thief," replied another.

PETER'S PERPLEXITIES IN PURSUIT OF SCIENCE.

BY THE REV. A. N. MALAN, M.A., F.G.S.,

Author of "Cacus and Hercules," "One of Mother Carey's Chickens," etc.

CHAPTER IV.

But I say, Mrs. Jones; d'you think I could speak to the Doctor on a little matter of important business?"

Mrs. Jones blushed and stole a hasty glance at the ruddy face of her admirer. Could it be that he was going to tell her master of his intentions to make a proposal? Less likely things had happened, and the thought caused a flutter of excitement in the worthy woman's mind.

"I dare say you could, Mr. Galpin. Step in, sir, and take a seat. Here, Jane! JANE! where is the idle hussey? Oh, there you are. Just go and tell Jinks to ask the Doctor if he could see Mr. Galpin, who wishes to speak to him on a matter of very important business."

Doctor Porchester sent word that he would see the butcher at once in his study.

The interview being granted, Mr. Galpin proceeded to narrate the mysterious affairs recorded in the last chapter, omitting the ghostly embellishments furnished by the boy Simon. "I thought it best to mention it, sir, in case you might be good enough to ask if any of the young gents has been up to a lark. The footmarks in my yard were undoubtedly made by slippers and those indiarubber shoes with lines across the soles; and I don't think any of the village lads ever wear them."

"Ah," said the Doctor; "it looks very suspicious, and I'm obliged to you for mentioning the matter, Mr. Galpin. But I cannot imagine any of my boys perpetrating such an egregious act of folly. What could they want with a sheep-skin?"

"There, sir, boys will be boys; and there's no telling what they won't be up to when the spirit of mischief comes upon 'em. I'm sorry to have troubled you, sir; but it ain't a thing to be looked over, and it's very annoying."

"Quite true, Mr. Galpin. I'll do my best to ascertain if any of my boys have been guilty of the offence. Good morning."

"Good morning, sir; and thank you."

"I hope the interview was satisfactory, Mr. Galpin?" asked Mrs. Jones, as the butcher once more made his appearance in the kitchen.

"Quite so, thank you, Mrs. Jones. Good day to you."

"Good day, Mr. Galpin; and I hope we shall see you rather oftener up here yourself, Mr. Galpin. That boy of yours has what I call an off-handish way with him sometimes, which is very disagreeable. I told him I should mention it to you."

"Oh, I'll let him hear of it, Mrs. Jones, you may be sure; the young impudence!"

With which assurance the butcher took his departure.

Dr. Porchester pondered over the revelations just made, and his brow gathered gloom as he marched up and down his study.

He felt pretty certain that two of his boys must have perpetrated a nightly adventure, and he was profoundly vexed

to think such a thing should be practicable in his well-ordered establishment.

He would assuredly find out the culprits and visit them with such severe retribution as might be calculated to deter them from ever again attempting such a breach of discipline.

But none the less did the doctor's spirit chafe and burn within the barriers of his deep chest as he hurried on his gown, snatched up his books, and went off to his lesson.

The boys were not slow to notice his irritable demeanour, and instinctively deduced the conclusion that there was something up, and they speculated afterwards in boyish fashion upon the probabilities afloat.

"What a wax the Doctor was in!" said one.

"I'm sure I knew my Rep. all right; why should he worry me so unmercifully?" said another.

"He told me I was incorrigibly idle, and didn't make the most of my opportunities, and a lot of bosh of that sort!" said a third.

"I expect some one's been getting into a jolly row; and I wouldn't be in his shoes if he's caught!" said a fourth.

It was the "quarter-hour," that brief but truly excellent interval which so agreeably divides the solid hours of morning school work.

The Doctor had gone to the matron's room.

"Mrs. Towels, did you hear any one moving about the house last night?"

"No, sir, I didn't; and I sleep so light, sir, that I'm sure I should have woken up at the least sound."

"Well, I have my suspicions that two boys left the house last night. I don't want to ask publicly about it, in case I may be mistaken. Have you noticed anything this morning that might point to suspicion?"

"No, sir; nothing whatever."

The Doctor gave two powerful sniffs.

"It's very stuffy in here, Mrs. Towels. I think you should keep the windows open at the top; nothing like fresh air! There's a very odd smell indeed about the room. What is it?"

"I think it must be from Master Caruthers's jacket, sir. He was sent up to change it just now. He seems to have got it covered with grease. I can't think how he could be so careless!"

"Let me see the jacket, Mrs. Towels."

The garment was produced from a cupboard, and its more immediate presence instantly caused the unpleasant odour to increase sevenfold. Dr. Porchester armed himself with the tongs, and, taking up the jacket with that instrument, he held it at arm's length with his right hand, elevating his double eyeglass into position with his left hand, and thus made a very deliberate examination of the offensive article.

"Ah," said the Doctor, "just as I thought. The boy has contrived to saturate his coat with stale fat in a most

A, good-morning, cook," said Mr. John Galpin, with a beaming smile, as he deposited his basket of "top-sides" at the kitchen door of Highfield House. "A fine morning, Mrs. Jones; and how rosy you look!"

It had been remarked for some time past by the other servants that Mr. Galpin was somewhat pronounced in his attentions towards Mrs. Jones; and that worthy person was by no means displeased at the thought of possibly exchanging her sphere of domestic duties at no distant date for a position in which she might execute the same in a home of her own.

"Good morning, Mr. Galpin; very glad to see you, sir; and I hope the beef's better to-day than it was last week. The Doctor complained of its being tough and stringy; and the young gents be very particular."

"There, Mrs. Jones, it ain't the fault of the meat. The Doctor couldn't get better, not if he were to go himself and cut it off the living beasts. It's the oven as wants repairing, I fancy; you can't cook these big joints not what I call thoroughly satisfactory-like, unless the oven be constantly looked to."

Mr. Galpin's brother was the village ironmonger.

"Don't talk to me about my oven, Mr. Galpin. I knows when the oven's right and when it's wrong."

"Well, Mrs. Jones, I apologise if I said anything rude; and I wouldn't for the world presume to cast a doubt on your professional knowledge. But there's no better meat in the London market than mine, though I say it who shouldn't."

disgusting manner. Thank you, Mrs. Towels. Have the goodness to see that Jinks hangs this garment on a stout bean-pole in the orchard until I give further directions about it."

"Yes, sir, I will see to it immediately."

Dr. Porchester withdrew, feeling satisfied that he had discovered one of the offenders at any rate.

We return to Dobbin.

He had managed to take so much time in rectifying the faults of his toilet that he did not think it worth while to put in an appearance for the remainder of the Homer lesson. And Mr. Dunthorne, with a kindly regard for the boy's feelings, refrained from sending for him. So that Dobbin watched the clock, and at a quarter to ten slipped into his place for the arithmetic lesson.

He had reason to be grateful for the fact that boys at Highfield were placed in various classes, according to their capacity for each subject. Dobbin's mathematical powers being not equal to his classical attainments, he was only in the second class for arithmetic. Thankful indeed was he that none of the boys amongst whom he now sat had witnessed his late discomfiture over Homer.

He now looked far more respectable than was his custom on a week day. Like a snake that has cast its slough and comes forth with renewed youth, or as a stag, which the classic poets tell us puts off its years annually with its horns, so had Peter Carruthers cast off his old garments and come forth decked in his new. His handkerchief, liberally dosed with eau-de-Cologne, diffused a fragrant aroma round his person. His hair was neatly brushed. He had on a clean collar, and presented generally such a neat appearance that good occasion was found for young Dicky Tozer's remark that he looked as if he was going to an evening party.

Dobbin had recovered his spirits by the quarter-hour. The first class were privileged in the possession of studies. Dr. Porchester had lately built on a wing to the house for the special purpose of providing a small and cosy apartment for each of the ten senior boys. Dobbin had sped with the fleetness of a roe to his sanctum for a brief fifteen minutes' consolation.

He brought forth from his playbox two glass-stoppered bottles of nitric and sulphuric acid, surreptitiously procured from the chemist's assistant by Charlie Ross. Over these he gloated with the fervour of some ancient alchemist absorbed in his researches for the philosopher's stone.

Dobbin did not understand much about the properties of these dangerous liquids. He took out the stoppers and smelt the contents, and nearly dropped one of the bottles as its pungent fumes caused violent irritation to his nose. He was alarmed at the smoky vapours which ascended from the bottle of nitric acid, and fully expected it to burst into flame on the spot. He got some of the liquid on his fingers, which stung him painfully and produced a yellow stain not to be removed by any amount of licking. He began to feel a dread of the bottles, and noticed with apprehension the strong chemical smell which they imparted to the atmosphere of his study. He resolved that as soon as ever morning school was over he would take and hide the "beastly things" in some safe place out of doors,

so that no harm might come from them to his study.

Hastily replacing them in his box as the bell rang, he went off to his lessons.

Dobbin was manifestly agitated during the latter part of the morning school. His mind was preoccupied with the important events of the last twelve hours. His heart palpitated as he saw the object of his hopes and fears apparently within his grasp. He would be off to the woods that afternoon immediately after dinner. With Ross to help him he would nail the fleece round a log of timber that he knew of in a very secluded glade of the wood. And on the Saturday afternoon, which was actually the next day, he would make the magnificent experiment.

"What are you mooning after now, Carruthers? Go on with your work!"

Recalled to sublunary matters from the sublimities of scientific meditations, Dobbin put on a studious attitude for the remainder of the lesson.

At last it was over, and he hastened to his study to convey the bottles to a safer place. Taking them out of his box, he put them carefully in the pocket of his jacket, which he buttoned up, and was hurrying along the passage when he encountered Browning and Tozer.

"We were just coming to find you, Dobbin. The Doctor wants to see you immediately in the matron's room. He can't wait a moment. What have you been up to, Peter, eh? Picking a peck of pickled pepper? Won't you catch it! Yoicks!"

And Tozer, who was carrying a piece of a broomstick, playfully administered therewith a dig in what he imagined to be Dobbin's ribs.

Little did he reck the consequences of that reckless deed!

I once remember making a chemical experiment with all due caution in following the directions given in the book. I was told to add sulphuric acid to a solution *while hot*. Now the author of that treatise has much to answer for, in thus deluding the unwary student. Had he written such instructions in these days, we might have connected him with the dynamite fraternity. For experience has stamped it on my memory that one might as well sit down upon a barrel of gunpowder, and stir up the contents with a red-hot poker.

But who can imagine the direful catastrophe that resulted from Tozer's heedless jest?

For the broomstick alighted upon the two bottles in Dobbin's pocket, and broke them both. The terrible liquids thus liberated mingled together with most frightful vehemence; surging and seething with relentless fury, like the fiery floods of Mauna Loa, or the flaming whirlpools of the fabled Phlegethon.

For a few moments Dobbin was hardly aware of the disaster. Then shriek after shriek burst from the lips of the miserable victim. He pulled at the buttons and with frantic energy tore off his jacket. But the acids had eaten their way through, and seized upon his waistcoat. They dropped in frothing clots down his trousers. They seized and devoured the substance of his garments. Yelling with terror and pain he tore at his waistcoat and rent it off. But his shirt was contaminated. His trousers were rotting away under his very eyes.

Screaming for help, he rushed to the matron's room, shedding fragments of clothing in his mad career. Into the very arms of Dr. Porchester rushed the frenzied Dobbin, startling that worthy pedagogue as though a maniac had burst upon him.

"I'm burning, sir, oh save me! I'm killed, oh-h-h-h!"

Mrs. Towels gave one scream, and fainted away.

The Doctor saw that some terrible mischief had seized the boy. Catching him by the collar, he rent his shirt down, and tore it off, likewise his nether apparel, by almost superhuman power. He then called a boy and sent him off with all haste for Dr. Clark; and another was set to throw water in Mrs. Towel's face to bring her round.

Meantime Dr. Porchester had thrown a sheet round Dobbin, and was hustling him off to his dormitory. Arrived there, the Doctor took a wet sponge and washed the injured parts to remove the tainting acids, and having so done he bundled the unfortunate boy into bed. Dobbin all this time had been shrieking and moaning and writhing with pain—and so he continued until Dr. Clark applied copious ointment to the wounds, and otherwise soothed the patient by medical treatment. There was a great discoloured patch upon Dobbin's left side and left shin, his hands were badly burnt, and the pain was almost insupportable.

For many days Dobbin's state gave cause for considerable anxiety; during which time Dr. Porchester of course refrained from exciting the boy by any questions.

And I have reason to believe that the shock to Dobbin's system was so great that he partially forgot the circumstances which led to his terrible suffering. Whether or not Dr. Porchester learnt the whole story I have not been able to ascertain. But one thing is certain, that when Dobbin was well enough to be moved he was sent home, and never again appeared at Highfield. And probably to this day his stupendous discovery, which was to electrify the world, remains an unsolved problem.

IVAN DOBROFF: A RUSSIAN STORY.

By PROF. J. F. HODGETTS,

Author of "Harold, the Boy-Earl," etc.

CHAPTER V.—(continued.)

"What a scene was there!"

SMIRNOFF reddened, but said nothing, yielding to the irresistible will of the general. But they had hardly left the room before a terrific crash like the explosion of some terrible engine of war seemed to rend the air. For a moment they stood petrified with astonishment; another moment they were in the room where they had left the soldier.

What a scene was there! The windows were actually blown out of their frames, and the wooden wall against which the chest of library drawers had stood was shattered and blown down. The floor was frightfully ploughed up, and, with his arm blown from his side, and the right leg frightfully shattered, the Cossack lay, a stunned and blackened mass, flung some distance by the concussion.

The first act of Kakaroff was to rush to the disabled soldier, and to ascertain whether life were extinct or not; the next was to send off the other Cossack to the nearest surgeon to telegraph for men from the police barracks to keep off the crowd, and for the fire brigade to get the flames under which were seen to issue from the woodwork.

This promptitude was productive of

excellent results. The surgeon was on the spot in an incredibly short time, and police-soldiers seemed to spring up from the very earth. It would hardly be believed in England if we were to state in how many (or rather in how few) seconds the pumps and other machines belonging to the splendid fire brigade of Moscow were in attendance. The surgeon pronounced life not to be extinct in the prostrate form of the Cossack, and a detachment of police-soldiers were told off to bear him to the nearest station; but on arriving there they found that the poor fellow had expired on the way.

The flames were soon extinguished, and, save in the room itself and the one adjoining, there was comparatively little damage done to the datche. The loss to Smirnov in valuable papers was considerable. Still, as a true merchant, he showed no symptoms of distress or dismay. He only said to Kakaroff, as if in parenthesis,

"What an ungrateful scamp! So much for university training."

"I see you connect this with Palitzki, the missing student," said the police general.

"I fear I must do so. No one else had any interest in destroying papers in that chest of drawers; and the active means I have taken to discover him must have embittered him against me, while the use of dynamite points to a certain band of miscreants with which that very paper proves Palitzki to have been in league. Doubtless he picked the lock, abstracted the paper, and left the bomb to be exploded by opening the drawer."

"It was, luckily for you, a very small one," said Kakaroff; "had it been a regular bomb there would not have been a stick of wood remaining. As it is, my poor Cossack saved your life at the expense of his own. You see I was right in getting you out of the room, but I am sorry for the poor fellow; he was a good man as soldiers go."

"Of course I shall provide for his family, if he has any, and I dare say he has—poor people always have."

"His family are deserving people, but, as you say, very poor. You could not do a better deed than provide for them. The widow is an excellent specimen of a good Russian mother, and the children are industrious and well behaved. The father

was a disciplinarian, and the result is very satisfactory."

All this time the work of removing the rubbish and rescuing what could be saved from the ruin went on. The active *posjarniks*, or firemen, swarmed everywhere at once. The drill, based on the Prussian system, was admirable, and it is wonderful how much discipline can effect. The men were small and active, far from intelligent to look at, but discipline had made the corps a most effective one; and though the pumps were of the oldest form, and all the machinery of the queerest, the work done by the firemen would have put to shame many more elaborate arrangements in civilised Western Europe.

The damage therefore was comparatively slight, although, as before remarked, Smirnoff had lost some valuable papers. The furniture and decorations of the room had been terribly shattered, while the destruction caused by the water and the presence of the fire brigade was considerable. Of course the most valuable documents and deeds connected with mercantile speculations were all in the strong boxes, either at his own place of business or at the *Koopetcheskie Bank*. Equally of course he was insured, so that the affair might have been worse.

Kakaroff was highly incensed at the loss of his favourite Cossack, and after giving full and ample directions to the police officers of the "Tschast," or division of the town, drove back to the headquarters of the police, to concoct with his aides-de-camp plans for the detection of the miscreants, who were thus commencing to throw the whole government of the country into confusion, and were filling all classes with terror and dismay.

The palace of the prefect of police is one of the most imposing buildings in Moscow. It combines within itself many branches of the police administration of the city and district, which in any other place would be separate departments. It is the headquarters of the police, the fire brigade, of the telegraphic service, and of sundry other important branches of the civil government.

In a spacious apartment in the principal building of the cluster which formed this palace were two officers in the splendid uniforms of colonels of the *gensdarmes*, or mounted police. These are perhaps the best mounted, best uniformed, and altogether best appointed troops in Russia. They are (or used to be at the time of which we are writing) habited in a uniform somewhat resembling our Horse Guards, only without the cuirass, and instead of the ordinary sabre they wear a curved sword hung from the belt with the curve upwards, in the Oriental fashion. The colour of the uniform is dark green, and, unlike that of our Horse Guards, is double-breasted. But it is seldom seen, because in the autumn and winter the men wear the long grey overcoat, which conceals the uniform of all arms alike.

But besides these two colonels in their gorgeous uniform of green, scarlet, and silver, there was a third present who is not quite so much a stranger to us, for we made his acquaintance when our story opened, and Peter Ivanovitch Zakoffsky, whom we last saw at Berozovo, was now pacing the long room in company with the officers who were awaiting the arrival of Kakaroff. He

was in the undress uniform of a general of cavalry, with the two broad red stripes down the trousers, which indicate more than any other distinction in Russia the rank of general.

"Your excellency must pardon me," said the elder of the two colonels. "I did not expect that our *chef* would have been so late. Perhaps you would like to call again, or, if you please to confide any communication to me I shall esteem myself flattered and honoured beyond all expression, and if I could be of any use myself, in advice or actual service, you have only to say the word, and everything shall be done as you wish."

"You are most obliging; but there are several reasons to prevent my speaking to any person on the subject but himself, although it may be that you will know more about it than I do in the course of the evening."

General Zakoffsky rose and looked at his watch, saying, as he did so, "I fear I cannot wait any longer," when the small shrill bell of the telegraph in the room announced a communication. The senior officer of the two colonels advanced to a small cupboard, which he opened, and disclosed a telegraphic apparatus.

With the ease of long practice he read off the message:

"All over. His excellency returning."

"What! has there been trouble?" inquired Zakoffsky.

"Nothing particular; only an accident at Zakolniki. His excellency will be here in half an hour."

"Then I shall trespass on your courtesy and beg you kindly to tell him, on his return, that I have only recently come from the Riazan district, and am very desirous to see him."

"I am certain that he will only be too glad to see your excellency, especially if you can throw any light on the 'Dobroff Mystery,' as we are beginning to call it."

"I thought, gentlemen, that you would be so familiar with mystery that nothing would have any special right to that name in the way of your professional work."

"We generally find out some clue to other mysteries, but this has baffled us."

"Indeed! Well, I wish I could throw some light on the subject, but I fancy it is out of my line. In half an hour I will call again. Adieu, gentlemen, many thanks. No—pray do not give yourselves the trouble to see me out."

But military etiquette would not allow of this, and the two colonels attended the general down the grand staircase, taking no notice of the footmen and guards who lined the way. A very graceful military salute was accompanied by a bow performed as only a Russian can perform it.

The two colonels (one being full colonel and the other lieutenant-colonel) returned to the room in which they had been pacing up and down while the general was waiting.

"What a close fellow is the general," said the senior. "I am convinced from his manner that he knows more about this queer business than he cares to acknowledge."

"He knows about the Berozovo part of it and nothing more. The real mystery is the disappearance of the boy here and the reason for it."

The two officials chatted until the return of their *chef*, whose drosky now rattled up to the official palace, and very soon Kakaroff stalked wrathfully up the

broad stairs, having been greatly excited, annoyed, and exasperated by the events at Zakolniki which we have chronicled.

"This is getting worse and worse, gentlemen," said Kakaroff, entering the *salon*. "My guard murdered before my very eyes, our best precautions set at naught, and the dignity of the police of Moscow held up to ridicule. We must make examples of the miscreants—when we catch them."

"Certainly, your excellency; and you may have the satisfaction of hearing something bearing on the case, though perhaps only indirectly, from General Zakoffsky, who will be here in a short time."

"*Charmant*," cried the *chef*. "Let us hope that he has something to tell us! Where is he lodged?"

"Dusaux's, your excellency."

"Passport in order?"

"Perfectly. He is last from Riazan."

"What number at Dusaux's?"

"No. 15 on the grand tier (first floor)."

"Who is looking after him?"

The elder officer turned to a note-book, and after rapidly going through a few recent entries exclaimed,

"Major Ivan Gregorievitch Dolzoff, your excellency."

"Who is with him?"

"Boris Orloff and six men; one is a waiter."

"Very good. When is he coming?"

"We expect him in the course of the afternoon."

"*Bon*, we must wait."

Kakaroff flung himself into an easy-chair in front of a writing-table crowded with letters and papers. He selected a formidable-looking missive in an official envelope, sealed with a reckless disregard to economy in sealing-wax, and touched the spring of an electric bell. A secretary in the dress of a civilian made his appearance, and Kakaroff, rapidly writing, finished a letter in reply to this official despatch, and signed a number of formidable-looking documents of large foolscap size, partly printed and partly written; these he quickly signed, and stamped with the police seal which lay at his side, and delivered to the secretary, who disappeared without a word.

In the midst of these occupations a servant entered the long room by a distant door, and approaching the aides-de-camp, announced to them in a low tone the arrival of General Zakoffsky.

In a moment all traces of preoccupation and care had vanished as by magic from the countenance of the police master. He held up his hand to command silence, although the communication made by the servant had been made in so low a whisper as would have been inaudible to most ears. He held up one hand for a moment, and then touched a second electric bell, upon which another official entered the room and was soon standing by the side of Kakaroff, who only said:

"In the blue cabinet, and use the greatest precautions not to let a word escape."

"Not a word shall escape me," was the reply; and he immediately left Kakaroff's table, near which he had been standing, and went to a panel in the wall in which was a small keyhole, so small as to be imperceptible to any person unacquainted with the secret. He applied a key and opened the panel, which disclosed a square chamber well lighted from the top,

but having no window in the walls. It was handsomely furnished, and what is rare in Russian rooms, the floor was completely covered with a thick Turkey carpet. But the most remarkable thing

about the room was that, owing to the partition between it and the larger chamber being of wood, every word uttered near this partition in the larger room could be heard in the smaller one. The

chinovnik closed the panel, and Kakaroff gave a signal for the admission of our friend Zakofsky.

(To be continued.)

THE PLEASURES OF THE SEA.

BY ROBERT RICHARDSON, B.A.

'Tis pleasant to feel her curtseying low
Before the freshening blast,
That strives to crack the straining sails
And split the bending mast.

To hear the cheery mariners
Troll songs of hearth and home,
And to watch the circling sea-gulls sweep
Swift down the ruffling foam.

Reader, if thou dost care to prove
How sweet these pleasures be,
Trust one who knows the fickle foam,
From fireside warm he slow to roam,
Read all about these things at home,
And never go to see, my boy!
And don't run off to see!

To see the big waves rise and fall,
And the white caps of the seas
Like snow-wreaths curl and crisp and fast
Beneath the jovial breeze.

To visit zones where dazzling breadths
Of lonely ice-land lie;
Or seas where fairy tropic isles
Bask 'neath a golden sky.

This pleasant to stand on the heaving deck,
When fresh and keen and strong
The fair wind whistles through the shrouds
A shrill and merry song.

Straight through the tall green billows
The good ship cleaves her way;
The surges drench the bursting jib
In showers of stinging spray.

THE SEA KINGS OF OLD ENGLAND.

MARTIN FROBISHER.

ST. GILES'S, CRIPPLEGATE, where, on the 22nd of August, 1620, Oliver Cromwell married Elizabeth Bouchier, is famous for many things, but chiefly for its illustrious dead. Within it lies buried John Milton, the poet, whose grave in 1790 was so shamefully broken into, and the teeth knocked out and the hair cut off, and the corpse exhibited at twopence a head to all who cared to visit the horrible show.

"Ill fare the hands that heaved the stones
Where Milton's ashes lay,
That trembled not to grasp his bones
And steal his dust away."

Close by these lies John Foxe, the family tutor of Shakespeare's Sir Thomas Lucy, who gained his early reputation as a writer of college comedies in elegant Latin, and made his name a household word to posterity as the author of that "Book of Martyrs" which finds a place in so many Protestant homes. And not far off Milton and Foxe there rests all that was earthly of a man as famous in

another sphere among the greatest of England's worthies—Sir Martin Frobisher.

Frobisher was a Yorkshireman, born some say at Doncaster in 1536. He came to London to his mother's brother, shipped himself off to sea before the mast, and in 1554 went in the fleet to Guinea under John Lock. From 1560 to 1570 he was a commissioner of the coal trade with injunctions to "stop false measures," and in 1571 was employed at Plymouth superintending the building of a ship for service against the wild Irish.

Deeply struck with Cabot's idea of a north-west passage, he made it the object of his ambition to be its discoverer, and for fifteen years worked hard and unceasingly endeavouring to find some patron to give him the necessary ships. At last, thanks to Dudley Earl of Warwick, he was put in command of two small vessels, the Gabriel of thirty-five tons, and the Michael of thirty, and on the 7th of June, 1576, left Ratcliff for the north. As he sailed past Greenwich Queen Elizabeth shook her hand to him from one of

the windows of the palace in token of farewell.

In these days it would be considered simple madness to go on such a quest in such vessels, but to the men of that time it seemed to be the most natural thing possible, and not a word was uttered betraying astonishment at the smallness of the expedition. All told, the crews amounted to thirty-five men! And with these the passage through the Arctic Ocean was to be made to Cathay! One thing, however, should be remembered in connection with these early attempts, and that is that the true geography of North America was unknown; and as South America had been found to terminate in a point, the northern half of the continent was supposed to end in a like promontory, which had only to be slipped round to sail on the other sea.

With the Gabriel and Michael there went a ten-ton pinnace, which began by "bursting her bowsprit," and ended by foundering off Labrador. The Michael ran away. "The

worthy captain, notwithstanding these discomforts, although his mast was sprung and his toppe maste blown overboard with extreme fowle weather, continued his career towards the north-west, knowing that the sea at length must have an ending, and that

colony, left Harwich on May 30th, 1578. It was a failure. The gold was—well, pyrites. The geographical discoveries were, however, important. At first all went well. The old points were touched, “and, having a fair and large wind, we departed from thence towards

main sea directly upon the place of the straits, brought together all the ice a sea-board of us upon our backs, and thereby debarred us of turning back to recover sea-room again; so that, being thus compassed with danger on every side, sundry men with sundry devices sought the best way to save themselves. Some of the ships, where they could find a place more clear of ice, and get a little berth of sea-room, did take in their sails and then lay adrift. Other some fastened and moored anchor upon a great island of ice, and rode under the lee thereof, supposing to be better guarded thereby from the outrageous winds and the danger of the lesser fleeting ice. And, again, some were so fast shut up and compassed in amongst an infinite number of great countries and islands of ice, that they were fain to submit themselves and their ships to the mercy of the unmerciful ice, and strengthened the sides of their ships with junks of cables, beds, masts, planks, and such-like, which, being hanged overboard on the sides of their ships, might the better defend them from the outrageous sway and strokes. But as in greatest distress men of best valour are best to be discerned, so it is greatly worthy commendation and noting with what invincible mind every captain encouraged his company, and with what incredible labour the painful mariners and poor miners (unacquainted with such extremities), to the everlasting renown of our nation, did overcome the brunt of these so great and extreme dangers. For some, even without board upon the ice, and some within board upon the sides of their ships, having poles, pikes, pieces of timber, and oars in their hands, stood almost day and night without any rest, bearing off the force and breaking the sway of the ice with such incredible pain and peril that it was wonderful to behold, which otherwise had, no doubt, stricken quite through and through the sides of their ships, notwithstanding our former provision. For planks of timber of more than three inches thick, and other things of greater force and bigness, by the surging of the sea and billows, with the ice were shivered and cut in sunder, at the sides of our ships, so that it will seem more than credible to be reported of. And yet (that which is more) it is faithfully and plainly to be proved, and that by many substantial witnesses, that our ships, even those of greatest burdens, with the meeting of contrary waves of the sea, were heaved up between islands of ice, a foot well out of the sea above their watermark, having their knees and timbers within board both bowed and broken therewith.”

Although Frobisher's northern expeditions were really failures, his reputation as a skilful and dauntless seaman was made, and in 1585 he was sent out under Drake to the West Indies. In the fight with the Armada he was entrusted with the command of the largest vessel of the English fleet, an eleven-hundred tonner, indifferently named the *Triumph* or the *Victory*, and in her did most excellent service. In fact, on the fifth day of that glorious running fight, Frobisher and old Hawkins of the *Swallow* were knighted by the Lord High Admiral for their efforts in the battle. Frobisher had attacked the Spanish flagship and brought down her main-mast.

In 1590 Frobisher was out with Hawkins on the coast of Spain, and in 1592 was dispatched to recall Raleigh and take command of his fleet. In this expedition he captured that extraordinary craft, the seven-decker, *Madre de Dios*, which was the largest ship of her time, being one hundred and sixty feet long and of sixteen hundred tons burden.

Two years afterwards—in 1594—Frobisher was sent with ten ships to help the French king against the Spaniards at Brest. Crozan was attacked and taken, but Frobisher was mortally wounded in the hip while leading on his men to victory. He died a few days afterwards at Plymouth. The body was brought to London and laid to rest in St. Giles's.

Sir Martin Frobisher.

some land should have a beginning that way.” Labrador was reached on the 28th of July, and Hall's Island, Frobisher Bay, and Butcher's Island were visited, and the Eskimos first seen. So strange did these Eskimos appear to the wondering sailors, that as they paddled about in their kayaks they were mistaken for porpoises or some strange kind of fish. In order to give his countrymen a sight of “one of these strange infidels, whose like was never seen, read, nor heard of before,” Frobisher kidnapped one and brought him home with him, together with a narwhal or “unicorn,” and another prize in the shape of some iron pyrites, which he mistook for gold.

On what strange trifles great events do hang! This unfortunate iron pyrites gave the first great impetus to Arctic discovery. Frobisher returned to Harwich on October 2nd, and, thanks less to his bravery and enterprise than his “golden ore,” became at once a famous man. A new expedition was organised; the Queen lent one of the royal ships, the *Aid*, of two hundred tons, and subscribed a thousand pounds towards the expenses, the Cathay Company was started, and Frobisher—made admiral of all the lands and waters he found anywhere but to the eastward—set sail in May, 1577. His squadron consisted of three ships—the *Aid*, the *Gabriel*, and the *Michael*. He made his way to his old hunting-ground, collected about two hundred tons of the “golden ore,” duly certified by the “goldfinders” he had with him, and was back at Harwich in September.

Before the ore was assayed a third expedition was fitted out, and Frobisher, with fifteen vessels and a hundred settlers for the

Frobisher's Straits on the 23rd of June. But first we gave name to a high cliff, in West England, the last that was in our sight, and for a certain similitude we called it Charing Cross. Then we bore southerly towards the sea, because to the northwards of this coast we met with much driving ice, which, by reason of the thick mists and weather, might have been some trouble unto us. On Monday, the last of June, we met with many great whales, as they had been porpoises. This same day the *Salamander*, being under both her corses and bonnets, happened to strike a great whale with her full stem with such a blow that the ship stood still, and stirred neither forward nor backward. The whale thereat made a great and ugly noise, and cast up his body and tail, and so went under water; and within two days after there was found a great whale dead swimming above water, which we supposed was that the *Salamander* struck.”

Soon, however, storms gathered round; the *Judith*, Drake's old ship when under Hawkins, disappeared; the barque *Dennis* was struck by an iceberg and sank in sight of the fleet, the men being saved in the boats of the other ships.

“This sinking of the *Dennis* was,” says Best, “a more fearful spectacle for the fleet to behold, for that the outrageous storm which presently followed threatened them the like fortune and danger, for the fleet, being thus compassed as aforesaid on every side with ice, having left much behind them, through which they passed, and finding more before them through which it was not possible to pass, there arose a sudden terrible tempest at the south-east, which, blowing from the

"With the Compliments of the Season!"—From our "Boy's Own Christmas Number."

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER VI.

IN an ordinary sail, either lug or gaff, without battens, and with the boom coming right aft, it is necessary to have some means of raising the boom over the occupant's head while tacking. (See diagram showing topping lift.) The topping lift (A A), on being hauled on, raises the boom (B B) to the position of

Fig 7. In Fig. 6 the mast is A A, and the yard (D D) is fitted by rings to the mast, up and

can either be made fast round the yard, or the upper ring can be fitted with a bolt and

Sliding Gunter.

Fig. 7.

Fig. 6.

the dotted line, sufficient to clear the occupant's head; or, if required, the boom can be hauled up to the mast. The sliding gunter (Fig. 6) is a very useful rig for a canoe or small sailing boat, particularly if fitted as at

down which it slides. The halliard (B) passes through a sheave at the head of the mast,

shackle for the halliard to be made fast to. On this yard a leg-of-mutton sail is generally

DIAGRAM SHOWING TOPPING LIFT

Fig. 9.

FORE DECK SHEAVING
SLIDE FOR SHIFTING MAST POSITION

Fig. 10.

and lowers or raises the yard as required. It

set of a triangular shape, and the yard can be easily lowered for reefing; and when the reef is taken the yard is hauled into its place. By using a pintle at the foot of the yard (as at C, Fig. 7) the yard can be lowered away as indicated by the dotted line, and a triangular reef taken in at the foot of the sail, converting the leg-of-mutton into a gaff sail. And further reefs can be taken by lowering the heel-rope of the yard—an extra halliard must be fitted in this rig to the upper part of the yard, acting as a peak halliard.

If complicated fittings and gear are undesirable, they can be avoided by having a main and mizen balance lug. You can reef down the main and carry the mizen as long as the canoe will bear the sail, and if it is too much for her you can strike the mainsail and set the mizen lug on the mainmast, or stow the mainmast and sail and set the mizenmast, with its sail in the step of the mainmast. For this purpose the lower part of the mizenmast—that part from the deck to the step below, which is generally square to prevent shifting—is frequently made of the same size as the foremast at the same place, though the remaining part of the mizenmast is generally sligher than the mainmast. All the mast-fitting should be watertight—and, better still, cased in; and all other openings in the deck should be so constructed that a minimum of water shall be shipped. What is taken aboard ought to be at once removed with a sponge. Many canoes are fitted with airtight compartments at the ends, and of course such craft are far safer than those without. The air-cases may be made of zinc soldered, or of wood with the joints made watertight; or indiarubber bags inflated can be stowed in the ends of the canoe of sufficient size to float her. In the latter case the bags must be strong enough to resist the pressure of the water in case of an upset. Too slightly made bags in such circumstances

Fig. 8.—Cutter close hauled.

would probably burst, which would be rather awkward.

A very good way of making a canoe or

of the mast in a line with the main-boom by a goose-neck allowing universal motion) is hauled up and down the mast. It is generally

to do it, and carries it out as he thinks will work most to his satisfaction, and if ever you carry a spinnaker you will probably

Fig. 11.

sailing boat fitted with a mizen handy, is shown in the diagram of the mizen-sheet working from the rudder; or a neater way is to work it from the outer end of the tiller, which must be made purposely, as indicated by the dotted line. The effect of this arrangement is that when the helm is put up the mizen-sheet is eased off, and the boat falls off at once. By taking the main-boom and pushing it out to windward at the same time the boat will turn in her own length like a top, particularly if the sails are battened; and if tacking, when the helm is put down, the mizen is shoved up to windward and brings the boat about directly; and this handiness of working is no small matter in narrow and crowded waters. I have seen a boat with battened lugs fitted in this way work in and out of craft where there was hardly more than her own length to turn in.

Fig. 12 is a sketch of a canoe fitted with these battened sails. She has a kind of leg-of-mutton or jib-headed sail forward, and a smaller one of the same kind for a mizen aft. A sprit-mizen would perhaps be better, as it would set more canvas and keep the sail low. If such a rig were fitted with some adaptation of the principle of the sliding gunter, it would be extremely handy, as you could lower away the upper portion of the mast and take a reef in the sail with the greatest ease. A sliding gunter is best fitted at the back of the mast, not as a topmast in front, as the sail having to be laced to it, if it were forward of the mast it would set the sail badly.

In racing canoes a spinnaker is used when off the wind; it is of the same form as that used in an ordinary racing yacht, but of course considerably smaller. From the accompanying sketch you will get a very good idea of what a spinnaker is like. As you see, it extends from the masthead to the deck, and is hauled out on a boom called the spinnaker-boom, at right angles to the vessel, or at some larger angle, according to the wind, the spinnaker being kept on about the same parallel as the main-boom, as if the main-boom and spinnaker-boom were all one spar. When not in use the spinnaker is stowed away in the sail-locker, and the spinnaker-boom (which fits on the side of the lower part

short enough to pass under the fore-stay, as it frequently has to be dipped under it and

know enough by that time to enable you to act in the same way, and I only hope it

Sail fitted with Chinese battens.

the spinnaker set the other side should the wind haul round enough to jibe the main-sail. A canoe spinnaker is set as the owner thinks best; he has the general idea how

will pull your craft along as it appears to be doing our friend the cutter.

(To be continued.)

CORRESPONDENCE

G. K.—The words ending in "able" are derived from Latin verbs whose indicative ends in "are;" those ending in "ible" come from Latin verbs with indicative ending in "ere," etc. Hence, accusare—accusable; accessere—accessible, etc.

LEV.—An ounce of gold may be beaten into 1,600 leaves, each three inches square and about a two-hundred-and-eighty-two-thousandth part of an inch thick. A sovereign weighs 123.275 grains. Now how many ounces of gold are required to cover an acre?

B. S. W.—1. The fees payable on patents for the first four years amounts to four pounds, and then the certificate of renewal costs you fifty pounds. In Canada the patent is taken for five years, and costs eighteen pounds. In the United States the total cost is twenty pounds. 2. The telegraph rates to any part of Europe are under two shillings per word, to South Africa they average nine shillings per word, to India five shillings, to China eight shillings, to Australia ten shillings, and to Japan twelve shillings.

ENGINEER.—You can obtain castings of model engines from Mr. Phelps, 257, Kentish Town Road, N.W., or from any of the model dockyards. See our articles in the third volume.

D. C. D.—Any advertising agent will tell you the principal newspapers published in the district, and undertake to insert an advertisement therein at a slight increase on the local charge. In colonial papers there is always a special group of missing friends advertised for. You could ascertain if the ship arrived safely or not by applying to the owners, or to Lloyd's.

A. B. J., HARRIS, LANDSEER, and Others.—Buy the indexes, and search out the articles for yourselves.

UP IN THE MONUMENT.—We are unable to give the addresses of our contributors without permission, and we have not permission in this case. A letter addressed under cover to us will be forwarded.

SCRIBE.—The shapes of the "r's" and "t's" do not vary in accordance with any rule. The shape is chosen which best suits the style of the handwriting, or the particular letters preceding and succeeding that you are at liberty to vary. With your hand you would not be far wrong to cross all your t's, and use the current instead of the small text r.

TOM.—1. In Anderson's Geography the pronunciation of the names of places is given. There is an appendix to Webster's, and other dictionaries, giving the pronunciation of the most names of persons and places. 2. Apply to the Civil Service Commissioners, Cannon Row, Westminster.

MACCLESFIELD.—The wind blows in different directions in different districts, owing to the fact that climate is greatly affected by the local conditions, and hence the difficulty of weather-forecasting over large areas. A range of hills will change the direction of the wind in the valleys.

FUNGUS.—In the May part for 1884 you will find directions for preserving fungi. Dr. M. C. Cooke's manual on the subject is favourably known.

W. H. HALLAM.—1. The cheapest edition of the works of E. A. Poe is that published at seven shillings and sixpence by Messrs. Chatto and Windus. 2. You must be apprenticed. That is all. 3. For mechanical matters generally there is no better journal than the "English Mechanic." 4. A pike weighing 28½lb. must have been a monster, but it is not by any means the largest. One weighing 40lb. was in the Fisheries Exhibition. 5. A 2lb. perch was well up to the average, and we congratulate you.

ANXIOUS.—To etch on steel or cast-iron mix together four drachms each of sulphate of copper, sulphate of alum, and muriate of soda, with three drachms of strong acetic acid. Smear with yellow soap, and use a quill without a split.

F. WIGENS.—The chief passenger lines of steamers do not take midshipmen or apprentices. All their officers must previously have served in a sailing-ship. If you wish to go to sea you must begin in a sailing vessel, unless you do not care to rise in your profession.

J. S. F.—At almost any tool-maker's where they sell lathes they can give you the address of a practical turner, with whom you could arrange for a few lessons. Try "Amateur Work." For the ambulance corps apply at Scotland Yard—Metropolitan Police Office.

A FISHER BOY.—1. The coloured plate of British Freshwater Fish was in the June part for 1881. 2. The best books on angling are "A Book on Angling," by Francis Francis, published by Longmans, price fifteen shillings; "The Practical Fisherman," by J. Harrington Keene, published by Gill, price half-a-guinea; and "Float Fishing," by Martin, published by Sampson Low and Co., price two shillings.

A CRICKETER.—Should the bowler put out the batsman at his end, the score-sheet is marked "run out;" should he miss the wicket the throw is not counted as a ball in the over.

GINGERINERO.—A batsman is only out "hit wicket" if he hits the wicket in striking at the ball.

A HARRISONIAN.—1. It does not follow that the champions hold the bests on record. For instance, the long-jump champion for 1884 is E. Horwood, with 21ft. 9½in., whereas the best on record is 23ft. 1½in. by J. Lane in 1874. The putting-the-weight champion was Owen Hart with 39ft. 10in.; the "best" is E. J. Bor, with 42ft. 5in. in 1872. The hundred yards champion is Cowie, with 1½sec., the mystic number which every runner attains and never exceeds. The half-mile champion is W. G. George, with 2min. 2½sec.; the "best" is H. H. Sturt's 1min. 55½secs. in 1878. 2. An overthrow to the boundary must mean runs, and the batsman should certainly not be given out for the recklessness of some stupid fieldsmen. What had he to do with causing the overthrow? 3. There is not, nor could there be, such a person.

HECTOGRAPH.—The simplest of the graph compositions is made by soaking a pound and a half of good glue in water until it becomes flaccid, and then boiling it in a water-bath—that is, a proper gluepot—with six pounds of common glycerine, keeping the heat up for some hours in order to drive off all excess water. There is another composition, consisting of two hundred and sixty parts of water, one hundred and fifty of sulphate of barium, sixty of gelatine, sixty of sugar, and three hundred and sixty of glycerine.

JOHN OF GAUNT.—The "coin" is a token halfpenny. Many such exist.

DINGO.—1. The sturgeon are imported, and the improved means of communication account for the comparative abundance. 2. You might be able to hire a microscope, but you would have to pay a deposit and give references.

ITZDOODLE.—Apply to headquarters. For instructions how to become a policeman, go to Scotland Yard or Old Jewry.

DIAGENES.—An application to one of the large advertising agents, such as Messrs. Street, of Cornhill, would procure you any newspaper in the world, after reasonable notice and prepayment of cost.

SCHOOL AND THE WORLD :

A STORY OF SCHOOL AND
CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The
New Boy," etc.

CHAPTER XIX.

THEY sat talking some time longer, then Fanshawe yawned, and proposed going out somewhere.

"I must be moving home," said Lang ; "it's getting on for half-past nine."

"Bosh! You haven't to be in by ten, I suppose? and I told them you'd be late. We'll go and see something."

"I'd sooner go another night," said Lang. "You see, I've never been to this house I'm staying at before, and it won't do to turn up for the first time after they've all gone to bed; I shouldn't know my room, for one thing."

"Oh, there'll be a servant to look after you."

But Lang was firm for once, and refused to do more than make one call on his way home. As it was, he did not reach Mrs. Turner's house till just eleven.

Mrs. Turner met him in the hall and showed no anger at his late entry. She was a pleasant, motherly-looking lady—the widow of a City merchant who had failed, and died soon after.

"I hope I haven't kept you up?" said Lang.

"Oh, no! I'm seldom in bed till later than this, and you can always get in by ringing the night-bell. But I suppose you won't often be out late, it will interfere with your work?"

"No," said Lang; "I shall have to stick to it pretty hard, but I don't work late as a rule."

"Shall I show you your room?" asked Mrs. Turner.

Soady's First Dress Coat.

Lang was hungry—very hungry. He had eaten nothing since lunch except that miserable tea at Fanshawe's. But Mrs. Turner, who naturally supposed he had been dining with a friend, made no sign in the matter of supper, and Lang, who was rather ashamed of himself for turning up so late on the first evening, did not like to mention that he was dinnerless. So he went to bed hungrier than he could remember having been in his life.

He did not sleep well; the strange bed, his hunger, and the effects of some whisky, to which he was unaccustomed, resulted in a bad night. He was not looking his best when he descended to breakfast in the morning.

He found the dining-room two-thirds full of people; altogether about twenty were there. He was announced as he entered—a proceeding supposed to introduce him to the company generally.

He was rather startled to find every one bowed to him. He returned the salutation awkwardly, and before he had recovered himself found he was seated between a young fellow of about twenty-two and a lady, next whom sat her daughter.

The gentleman was a Japanese. Lang was surprised to see him amongst a lot of English people, and still more surprised to hear him talking fluently in English. He was a student at University College, and a dangerous rival to the English ones.

"Did you only arrive in London yesterday?" asked the lady on his left.

She spoke very pleasantly.

"I came in the afternoon," replied Lang.

"We didn't see you in the drawing-room last evening."

"I had to go out with a friend," said Lang.

"You musn't always run away from us," said Mrs. Hawtrey; "we poor women do not like to be left to ourselves. Besides, we want male voices when we have some singing. Are you fond of music?"

Lang was only able to say that he enjoyed listening to it very much, but could not perform on any instrument. How he wished he could! What a charming lady Mrs. Hawtrey seemed! It was really very kind of her to talk to him, though he felt embarrassed at first.

But even her conversation did not make him oblivious of the fact that he was extremely hungry. He ate a breakfast that was enough to make Mrs. Turner despair.

He found out before he left the house that lunch was at half-past one, dinner at six, and tea about half-past eight. He resolved not to miss the dinner again, at all events.

He spent the morning with his coach. What Mr. Porter thought of him he did not like to ask, but he felt as if every question were an exposure of his ignorance. Had it not been for his last week's work at home it must have been yet more apparent. Even as it was, he felt the most transparent fraud that had ever been in the coach's care.

CHAPTER XX.

It was Soady's last day home; his brief holiday was over. He was going to town to work under his coach until the examination came off.

"It's about time I went," he said to

Belle; "you girls are more than I can manage."

"Don't you think you had better leave off trying to manage us, then?" asked Belle.

"You must have some one to keep you in order, or else I don't know what would become of you. So I sacrifice myself for your good, Belle."

"Thank you. But from what you say your efforts don't seem very successful."

"That's one for yourself, miss!" said Soady.

"Yes; I must give you a chance sometimes. Are you going to come down to-night? or don't you think it will be better for you to spend the evening as usual, working upstairs?"

"I'm going to come down," said her brother, gravely; "and what is more, I'm going to dance with you!"

"You will have your revenge, I see," said Belle, as she ran away.

The fact was that Mrs. Soady was giving a Christmas party that evening, the last of her son's visit home. The girls were in high excitement about it; and even Soady, though outwardly calm, as became his dignity was anticipating the event with considerable interest. For was it not an epoch in his existence? Was he not going to don a dress-coat for the first time in his life?

Ha! his dress-coat! There had been some discussion about it before Christmas, in which Miss Belle's tongue had not been idle.

"I won't go out with you, Dick, I positively declare, unless you will dress like other people. To see a big strapping fellow like you in a short jacket is enough to make people laugh."

Soady himself was rather anxious to get out of his Eton jacket, which was growing uncomfortably tight under the arms, and was by no means too long. His brother comforted him by telling him "it would be long enough before he got another," but this was cold consolation.

So his father told him to go and get measured for a suit, and it was a proud moment for our friend when he first tried it on. At the party he was to wear it for the first time.

Another circumstance which filled his cup of rejoicing to the full, was the fact that Tommy was coming to spend the day and stay the night. Soady wanted to see the youngster badly, and shied his books finally aside when the sound of a cab told of his arrival.

"Well, Tommy," he exclaimed, when he had him safely indoors, "what sort of a Christmas have you had?"

"A 1," replied Tommy; "all except Boxing Day. I was a bit seedy then."

"Too much turkey and pudding?"

"Something of that sort, but I soon got over it; treated it on the homœopathic principle, you know—ate some more; *similia similibus curantur*—that's right, isn't it?"

"Near enough for you, Tommy. We're going to have times to-night, my boy; there's going to be all sorts of things—dancing too, Tommy. How do you feel about that?"

Tommy's face wore a curious expression.

"I'm afraid that isn't my strong point," he said; "how about you?"

"Oh, I'm all right; Belle's been taking me in hand."

"I wish she'd take me too," said

Tommy; "I expect my feet want taking in hand a good bit."

"Oh, you'll get on all right; it only wants pluck. They've got some tableaux too, and you're to be in them."

"Can't do it," said Tommy; "I'm sure to laugh. I tried it once, and spoilt the whole show."

"If you laugh to-night, Tommy, I'll skin you."

"I would only make me laugh the more," was the reply.

The house was turned topsy-turvy. One end of the dining-room was reserved for the tableaux, and was sacred to the performers. A certain Uncle Charles was to read selections from poems, the curtain was then to draw up and exhibit an illustrated tableau. The unfortunate part of it was that Uncle Charles was rather deaf. However, he read so well that it was considered advisable to have him. Besides, he was an uncle.

"There," said Belle, triumphantly, "he can't go wrong now. I've put markers in each page he reads from and numbered them in big figures. If he follows the numbering he must be right."

The company were arriving. Jane, the housemaid, thought that it was quite time the dining-room gas was turned up higher; so she went to that room to give the final touches before the visitors entered. In passing by the small table near the curtain on which rested the book of poems from which Uncle Charles was to read his illustrative extracts, her dress caught in a chair, she turned hastily round to free herself, when her arm knocked the volume to the ground. The markers flew hither and thither; Jane hastily gathered them up; a loud knock and ring startled her, she thrust the markers in at the first pages that offered themselves, and fled from the room.

Half an hour later the dining-room was filled by "a distinguished company," as Uncle Charles called his audience in a little preliminary address. Those who took part in the tableau were all posed waiting for him to begin to read. It was no small strain to stand in a fixed position, and they began to wish Uncle Charles would cut his oration short.

"Oh, dry up, uncle!" said Soady, *sotto voce*; "I'm getting the cramp."

"Hush!" said Belle; "they'll hear you."

"No fear of *his* doing so, I'm afraid," returned her brother.

Tommy was preternaturally serious. He knew that if he once relaxed he would go into convulsions. So he tried to think of all the serious things he could, reserving the most serious of all, a swishing, for the moment when the curtain should go up.

"I believe he's winding up," said Belle, in a whisper. "Keep still every one; and mind, Jack, you pull up the curtain directly he begins to read."

Jack nodded assent. He was a burly boy, a cousin, to whom they were obliged to give some part in the entertainment, and who was quite incapable of taking a character in a tableau. However, he could haul up a curtain well enough, and would obey orders. These were to pull up when Uncle Charles began to read, and to let down when the extract was finished.

Uncle Charles's oration was ended. He wiped his spectacles, took up the book, found marker No. 1, and commenced to read. Jack instantly hauled

up the curtain, and discovered a group representing the finding of the Sleeping Beauty in the Enchanted Castle. Soady was the Prince, Belle the enchanted Beauty lying on a couch with her hair let down; Tommy was the king, made up with an enormous white beard and wig; the rest of the company were courtiers, servants, etc. It was not a badly arranged group, and the lines which had been chosen to its illustration from Lord Tennyson's "Daydreams" were very appropriate.

Uncle Charles, with his back to the curtain and his face to the audience, began to read, slowly and emphatically, the following lines:—

"With fingers weary and worn,
With eyelids heavy and red,
A woman sat in unwomanly rags
Plying her needle and thread—
Stitch, stitch, stitch."

The audience looked puzzled at first, then amused. As the reader went stolidly on, utterly ignorant of what was behind him, the smile on the faces of the listeners grew broader. Still the unconscious reader ploughed on; he could not hear the excited whispers behind him. Soady felt his blood running cold, Belle looked anything but a Sleeping Beauty; they tried to motion to Jack to let down the curtain.

In vain. Jack had his orders, and meant to keep to them. He did not know what all the signs meant; he heard Uncle Charles reading, and so he kept hold of his rope.

At last Soady could bear it no longer. Uncle Charles was finishing the second verse, and the audience were trying hard not to burst into a roar.

"Pull down the curtain, you donkey, Jack!" he exclaimed, in a loud whisper that was heard all over the room.

This was too much for Tommy. He went off with an explosion which blew his beard off, and exposed his round face with a grin on it that stretched almost from ear to ear.

It was no good trying to keep up the illusion after that. The audience burst into a roar of laughter, in which the performers joined. Jack understood at last that he ought to lower the curtain, which he did. Belle was very indignant, but Tommy took a sensible view of the case.

"They've enjoyed themselves, I guess, and so've we, so where's the harm?"

"I wonder what uncle thinks," said Soady. "Somebody's been playing tricks with the book."

"I'll see it doesn't happen again," said Belle, rather angrily. She had taken a lot of trouble to get herself up for this tableau that she might look like the Sleeping Beauty, and it was too aggravating to be received with laughter instead of admiration.

Uncle Charles, who was dimly conscious of something wrong, was pulled behind the curtain, and the state of affairs was explained to him. Belle took the book, and altered the markers back to their original places, indignantly wondering who could have altered them. Tommy had an impression that she suspected him, an impression founded on the truth. However, Soady disabused her mind, and the affair remained a mystery, for Jane was careful not to divulge her share in the catastrophe.

On the whole, however, it was not to

be regretted, for it put the audience in a good humour, and they received the remaining tableaux with great applause, which was well deserved.

Then came the event of the evening—Soady's getting into his first dress-coat. Tommy eyed it critically.

"It doesn't seem to do you justice, old man," he remarked. "There isn't enough about the tails of it to form a sufficient contrast to the jacket which you have now discarded for ever. What pleases me more is the gay and gorgeous shirt-front which you are sporting. I seem to want to draw a picture on it, or a problem of Euclid. And that poor little stud in the middle of that vast expanse—it looks like an oasis in the desert, five miles from everywhere."

"Tommy," said Soady, gravely, "don't let your envy get the better of your politeness. Personal remarks are not considered the thing in good society."

"All right, old boy; we're alone." But Soady did not seem to think that it followed that he was not in good society because he was the only person present, so, at the imminent risk of spoiling his shirt-front, he chased Tommy round the room and administered "tokó" unto him.

"You wait, you beggar; I'll pay you out," said Tommy, as he smoothed his ruffled plumes. "I'll watch you dancing, and have my revenge that way."

But Soady flattered himself that he knew enough about it to keep himself out of trouble. Tommy was ignorant of the very rudiments; he had not reached the age when boys desire the company of girls other than their sisters. It would have been a good thing for the youngster if he had learned more; he might have entered the room naturally instead of awkwardly, and would not have had such a sheepish look when he saw the others choosing their partners.

Boys ought to learn the rules of good society. Look at the boy who has never been taught. How helpless he is when he is thrown (as he probably will be) amongst people who are older than he. How uncomfortable and awkward when he meets girls of his own age at a party. How selfish he is in the way he behaves; with what rudeness often he treats those of the opposite sex. And this not so much from innate boorishness as from a want of training.

The first lesson to be learnt is, perhaps, politeness. Ah! boys want teaching that badly. It is the best possible lesson for a boy to learn that a young lady is to be shown every consideration, that it is his duty and his privilege to wait upon her, to anticipate all her little wants, and to make the time pass as pleasantly for her as possible.

The second lesson to be learnt is confidence. I don't mean cheek or forwardness, but that naturalness of bearing which should be possessed by every one. You see a boy who is active and graceful enough in the playground; watch him when he enters a room full of people. He is constrained and awkward; he fancies the eyes of every one are on him, the consequence is he makes a fool of himself.

But this arises from excessive self-consciousness. Do you, my dear boy, think your entry into a room such an important matter? Be assured it is not, and that if you walk in as you see the grown-up men do, you will have no need to

blush and feel as if you would like the floor to open under you.

Never mind about the other lessons to be learnt later; master those two well, and my little lecture will not be without effect.

(To be continued.)

"B. B."

("Dulce et decorum est pro patria mori.")

OH, come, let us chant in melodious tones,
Let us warble a stave that is gay,
With Collard and Collard, with banjo and bones,

Let us drive "Atram Curam" away.

Let us tune up our triangles, string up our harps,

Let us buy penny-whistles galore,
Let us fix our attention on flats and on sharps,
And decipher the musical score.

And as it is well on some subject to seize
When we wish to burst forth into verse,
Let us choose the heroic exploits, if you please,
Of Captain Bartholomew Burse.

He was skilled in all mysteries—Aryan histories—

Ghosts—transmigration of souls;
All his dates he could say from the Flood to "to-day,"

And he understood currents and shoals

He was great at mechanics, including dynamics,

And sections relating to cones;
He could say off as pat as the size of his hat
The number of tropical zones.

But his nautical skill had acquired such renown,

That one day at Shoeburyness
There arrived for B. B., who abode in that town,

This document "O. H. M. S."

"Rex Georgius Tertius, Fidei Def.,
Greets his well-belov'd subject B. B.,

And he'll feel quite obliged to that gentleman if
He will get himself ready for sea.

"B. B. shall proceed to an island remote
(Which its name it is Wappiti Hi),
And the ways of the natives extensively note,
And report his results by-and-by."

Then joy was the portion of Captain B. B.,
And gaiety gleamed in his eye;
And choosing such things as were useful at sea,

He bade his dear auntie "Good-bye."

And now let us sing of the boisterous wave,
With tambourine, fiddle, and harp;
Let us warble a very melodious stave
In the key of G major (One sharp).

We will also endeavour to mention in verse
The briny and billowy sea.
(When we come to the sorrows of Mister B.
Burse

We will change to the minor key, E.)

The crew was a bo's'un, a tortoiseshell cat,
A sailor (whose aspect was meek),
A photographer boasting a chimney-pot hat,
Which he sported two days in the week.

Oh, blithe was their trip through the tropical
seas—

Albeit their journey was long—
As they glided away with remarkable ease,
Beguiling their leisure with song.

For the captain would choose a Dibdinic
refrain,

And pick out the tune on his lute;
And the bo's'un, when not engaged steering,
was fain

To perform barcaroles on the flute.

* The animal could not be persuaded that the camera was not a novel and ingenious mouse-cage, and at the critical moment she *would* look in to see what was going on. The result was, generally, as follows:—

The photographer, too, would set up his
machine

And focus them all as they sat;
And very effective the views would have been
If they had not been spoilt by the cat.*

* * * *

Now behold them arrived at the end of their
cruise,

They have reached the said island remote.
(Pray observe the photographer taking his
views,
And Bartholomew taking his *note*.)

"Oh, bring out a flag of a peaceful device,
And hoist it aloft in the breeze;
Let us send them a present of cocoanut-ice,
Or anything likely to please."

So they sent them the cat, the photographer's
hat,

A pair of old Wellington boots,
And some eau-de-Cologne, and a gravy-beef
bone,
And a cheque that was crossed "Coumts
and Coumts."

And Bartholomew got on a barrel to sing—
Which often that purpose had served—
And selecting the following beautiful thing
He warbled it. (All rights reserved.)

SONG.

"I'll sing you songs of Araby, and tales of
fair Cashmere;
I'll also give the *raison d'être* of our appear-
ance here.
Oh, natives, flock around in boats and listen
to my strain,
And worthy Mister Bo's'un here will join in
the refrain.

"We've come to see your little ways, O
natives of the isle,
My man will photograph you all, and I'll
take notes the while.
Then walk up, natives, and be took, O walk
up and be wise,
Our price is one-and-four the dozen, *carte-de-
visite* size."

But they paid no attention; they collared the
cat,
With the bones and the "Wellingtons"
too;
And they boiled them all down in the chim-
ney-pot hat,
And appeared highly pleased with the
stew.

And wishing for more, the black gentlemen
came

And boarded Bartholomew's barque;
And they said, "I say, cap., we'll take more
of that same"
(A rude and exacting remark).

Poor Bartholomew gave them some cold
mutton-broth,
Some tin-tacks, three hot buttered scones,
And some hat-pegs, and Tennyson's works
(bound in cloth),
And a portrait of Inigo Jones.

Yet they did not seem pleased with the things
I have named,
But much nasty temper they showed,
And (I think that their conduct is much to be
blamed)
They used dreadful words such as "blowed."

And finding no tortoiseshell pussies to stew—
Oh, sad is the end of my lay—
They set-to and boiled up the whole of the
crew.
Who have never been seen since that day!

SOME COMICAL BUTTONS.

By A. CHASEMORE.

HERE are a set of six comical buttons, the exact size of the originals, in the possession of a friend of mine. Each one is set in a copper rim which does not appear to have been gilt, and is protected by a thick convex glass like that of a watch. The heads which you see are double—the chin of one making the nose of the other—and are painted very carefully and delicately in black and white on vellum, on a black ground. The date when they were originally worn would be, according to the hats and wigs, about the middle of the last century.

Number one, or, more properly speaking, the top button, represents the head of a serious-looking philosopher, and his double a jovial sailor; the next that of a grenadier,

other with a peculiar headdress—half tortoise, half bellows; the upper head, for all we

of all that of another officer, and, say, the wearer again without his wig, who I should

the same that we see in Hogarth's "March to Finchley," and an individual who may be taken for a wild man of the woods; the next, a gentleman wearing his own hair, and an-

know, might be a portrait of the wearer of the buttons, joined to that of an officer in the army. The last but one depicts, I fancy, a peasant and a peer; and the bottom button

imagine to have been a bit of a wag in his way, hardly a sober citizen, and who wore these said buttons to give a jovial tone to the staid square-cut coat of George II.'s time.

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER VII.—MECHANICAL CONTRIVANCES.

BESIDES the paddling and sailing canoe there are canoes propelled by other means. Amongst these are steam canoes, screw and paddle canoes, in which the motive power is supplied by the occupant through an arrangement of cranks and cog-wheels, something after the principle of a tricycle, and canoes driven by electricity or galvanic batteries.

A friend of mine a short time ago amused himself during the "long" (he is a University man) in fitting a canoe with steam-power. The boat he bought very cheaply; I think it cost about four pounds. It was fitted with a screw and screw-shaft, and was then arranged for propulsion by the working powers of the occupant. My friend removed all this gear and made a very neat engine, the cylinder turned by himself, and all the parts cast from moulds made from his wooden patterns. These castings he afterwards filed down as requisite. When he showed me the engine it was complete and screwed down to its bedplate ready for use.

Now, in these small steamboats—and indeed in most contrivances propelled by steam, large or small—much more depends on the boiler than on the cylinder. Of course the cylinder must be strong enough to carry steam and tight enough to hold it fairly well, but a very ordinary engine with a first-class boiler is far better than a second-rate boiler and a first-class engine, though, to be sure, as is related in the legend with regard to the bishops of Bath and Wells, "Banth is best." The difficulty with my friend, as indeed with many others, was how to get a

boiler light enough, strong enough, and lastly, and by no means leastly, cheap enough. This riddle he solved by making his boiler of hydraulic tube, having ends cast and fitted, while a number of small internal tubes enormously increased the heating surface, and at the same time acting as stays greatly strengthened the boiler.

I cannot here describe in detail the whole of the *modus operandi*, but I will give you the result, which was that after several preliminary cruises in the Thames he sent the canoe by boat to France (Havre), and steamed up the Seine for some distance. To construct such a canoe as this would be above the ability and resources of most boys, and, indeed, after it is constructed it is a constant source of worry and expense. Still the fitting of an existing canoe with screw or paddles for manual propulsion is not very difficult, and indeed is within the capability of any handy lad. But you must remember that for speed nothing of the kind is as good as the oar, and for handiness nothing beats the paddle.

It was on the upper waters of the Thames, some years ago that I saw the canoe depicted on the next page. It was one of the first of that type ever produced, and created rather a sensation at the time. I was one of a party in a randan, and the canoe in question, with no sail set, and with the owner sitting with his arms folded across his chest, went through the water at some three knots an hour. It looked very pretty, and would be useful on a crowded river for dodging in and out of a multitude of craft, but I should think the work would be tiring and too much confined to one set of muscles; in

rowing both legs and arms are used. The paddle-wheel is a simpler contrivance, and would do very well on a private pond, but the best application of it is for the double-canoe, where the worker is able to sit as on a bicycle over his work, and thus economise power. A description of this may be given later on. All such arrangements are only fancy ones (except the latter), as the power gained by the leverage of the oar is far greater than that obtained in any other known way of utilising one's strength for the purposes of propulsion of water-borne vessels.

And while we are talking of curious forms of canoes it would not be amiss to look for a moment at the one depicted on next page, which represents a section of a double-keeled canoe, with a hollow bottom, that was on view at the Fisheries Exhibition. It was claimed in its favour that by the form of the bottom an enormously increased stability was obtained, and it certainly was a fact that you could sit on one side of the gunwale without greatly affecting the canoe in the way of heeling it, and for certain purposes, such as fishing, etc., where a stable platform is desirable, there is no doubt that this form of canoe might be found very useful, while in external appearance it does not differ from an ordinary canoe. It appears to me that the principle might be still further extended, and the sides and ends being separated from the well portion by watertight partitions, a well might be left each side, top and bottom, the seat being common to both wells. In this way if the canoe capsize it would only offer itself in a new form and one just as comfortable as the old one.

Such a principle was shown in some of the lifeboats at the Fisheries, which were something after the style of an enormous oval ring lifebuoy, with a perforated flooring filling the

the sketch, will be found most useful for long and continued use, as one of the greatest forms of fatigue is obviated—viz., the action of a head-wind on the elevated blade of the

tube joining the two ends where cut. It is as well, if making such a paddle oneself, to make it from one six inches longer than you require. In this case you can halve the

space inside, and so placed that if capsized it would offer the same facilities and convenience to the crew.

As the paddle is a very important element

paddle. This may appear a small matter, but if you try half an hour's paddling against a strong head-wind you will find it offer a very perceptible resistance to your progress.

handles at the joint for six inches, and then when put together by the metal tube it will be almost impossible for the handle to shift and alter the position of the blades, which

BODY PLAN OF CANOE WITH

in a canoe it is as well to give some attention to it. A light short paddle is best for all-round use, but for racing a long paddle is used. The feathering paddle, as shown in

In the feathering paddle the paddle is cut in two amidships, and one blade being turned at right angles to the other, the handle is fixed in that position by means of a metal

otherwise might be the case; or, if this is not done, a square tube will make the joint less likely to shift.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XII.—MAKING READY.

IN the morning, when Cyprien learnt what had happened at the banquet, the first thing he did was to strenuously object to the serious charge brought against his servant. He agreed with Alice that Matakai could not be such a thief as was supposed. In fact he would rather have suspected Pantalacci and his companions, who seemed to him very much more suspicious characters.

It was not likely, however, that a white man was the guilty party. To those who knew nothing of its origin, the Star of the Settlement was a natural diamond, and consequently of such value that the getting rid of it would be difficult.

"All the same," said Cyprien, "it cannot possibly be Matakai."

But then he suddenly remembered certain petty larcenies of which the man had been guilty. In spite of all his master's warnings the Kaffir had never been able to cure himself of his objectionable habits. What he had taken was, it is true, almost valueless, but still the tendency shown could not but tell against him in any judicial investigation.

And there were other things in favour of the presumption. There was his presence in the dining-room when the diamond was eclipsed as if by magic. There was his not having been found in his hut.

And then there was his flight.

For he had certainly left the district, and Cyprien waited in vain during the morning for Matakai to reappear. He could not believe in his servant's guilt; but his servant did not return. And further examination showed that sundry objects and utensils such as a man would take with him for a journey across the African desert had also gone. There was no further room for doubt. Guilty or not guilty, the Kaffir had fled.

About ten o'clock the engineer, very much more grieved at the conduct of Matakai than at the loss of the diamond, called at Watkins Farm.

There he found the farmer in conference with Pantalacci, Hilton, and Friedel. As he presented himself Alice, who had seen him coming, also entered the room where her father and his three cronies were noisily discussing what to do to recover the stolen diamond.

"We must follow Matak!," exclaimed Watkins, angrily. "We must get hold of him, and if the diamond is not handed over we must rip him open to see if he has swallowed it! Ah, my lass, it was a capital notion of yours to tell us that story yesterday!"

"But," said Cyprien, in a quiet tone, anything but pleasing to the farmer, "to swallow a stone of that size Matak! would have to have a stomach like an ostrich!"

"A Kaffir's stomach is capable of anything, Mr. Cyprien," replied Watkins. "And if you think there is anything to laugh at—"

"I did not laugh, Mr. Watkins," said Cyprien, seriously. "But if I am sorry for the diamond it is only because you allowed me to give it to Miss Watkins."

"I am just as grateful for it," said Alice, "as if I still had it."

"There's a woman's head for you," exclaimed the farmer. "Just as grateful as if she still had it—a diamond whose equal exists not in the world!"

"Well, it is not quite the same thing," said Hilton.

"Not quite!" added Friedel.

"On the contrary, it is the same thing!" answered Cyprien. "For as I made that diamond I can make another."

"Oh, Mr. Engineer!" said Pantalacci, with a threatening look. "I should advise you not to try another experiment—in the interest of Griqualand—and of yourself!"

"Really?" replied Cyprien. "I am not aware that I had to ask your permission in the matter."

"Don't let us talk about that," said Watkins. "Is Mr. Cyprien sure that he will succeed in a second attempt? Can he guarantee that the second diamond he makes will have the colour, the weight, and consequently the value of the first? Can he even undertake to make a second stone, even of inferior value? Has not his success been due in a great measure to chance?"

The engineer could not but be struck with the reasonableness of these questions. His experiences were quite in accord with the teachings and practice of modern chemistry, but had not chance come in to make him succeed? And if he tried again could he be certain of a triumph?

It was important then that the thief should be captured and the diamond recovered.

"By-the-by, have you found any trace of Matak?"

"None," answered Cyprien.

"Have they searched the neighbourhood?"

"Yes, and searched it well!" replied Friedel.

"The scoundrel probably cleared off during the night, and it is almost impossible to know where he has gone!"

"Has the police officer taken the matter in hand?" asked Watkins.

"Yes," answered Cyprien, "and he has found no trace at present."

"Ah!" exclaimed the farmer, "I will give five hundred pounds for him if they can catch him."

"Very likely, Mr. Watkins," said Pantalacci. "But I am afraid you will never see the diamond, nor the man who took it."

"Why not?"

"Because once he has got a start," replied the Italian, "he will never be fool enough to stop on the road. He will cross the Limpopo, plunge into the desert, and make for the Zambesi or Tanganyika, or go among the Bushmen if he thinks better."

Did the astute Neapolitan really think what he said? Was he not speaking thus to prevent any pursuit of Matak!, in order that he might undertake it alone? Thus thought Cyprien as he watched him narrowly.

But Watkins was not the man to give up the game because it was difficult to play. He would have sacrificed his entire fortune to get back the incomparable stone, and through the open window his eyes in their angry impatience seemed to gleam across the green slopes of the Vaal as if he hoped to find the fugitive on the horizon.

"What does that matter? I must have my diamond! I must catch this scoundrel! If I hadn't the gout it wouldn't take long, I tell you!"

"Father!" said Alice, trying to soothe him.

"Look here! what do you want for your trouble?" asked the farmer, looking round him. "Who'll go after the nigger? I'll make it worth your while."

And as nobody spoke he continued,

"You four want to marry my daughter! Well, catch me the man who stole my diamond"—he now called it "*my* diamond"—"and I give you my word that the man who does so shall marry her."

"Done!" exclaimed Hilton.

"Agreed!" said Friedel.

"Who would not endeavour to win so precious a prize?" simpered Pantalacci.

Alice blushed deeply and vainly endeavoured to hide her confusion, ashamed at seeing herself thus put up to auction, and that in the presence of the young engineer.

"Miss Watkins," said Cyprien, in a low tone and leaning respectfully towards her, "I should like to try my fortune in this, but have I your permission?"

"You have, and my best wishes, Mr. Cyprien!"

"Then I am ready to go to the end of the world!" exclaimed Cyprien, turning towards Mr. Watkins.

"You won't be far out," said Pantalacci, "for Matak! will lead you a nice dance. By to-morrow he ought to be at Potchefstroom, and he will have reached the hills before we have left our diggings."

"And what prevents our starting immediately?" said Cyprien.

"You can go if you like," replied the Italian. "But for my part I want some food with me—a waggon, a dozen oxen, and a couple of saddle-horses at the very least. And we cannot get that nearer than Potchefstroom."

Again, was Pantalacci speaking seriously? Was it his object to discourage his rivals? Perhaps; but he was nevertheless quite right. Without such means of locomotion, without such resources, it would be folly to attempt a journey in Northern Griqualand.

But a team of oxen, as Cyprien knew, would cost about four hundred pounds,

and he had only one hundred and sixty.

"An idea!" shouted Hilton, who, as an "Africander" of Scottish descent, had a strong vein of economy in his disposition. "Why shouldn't we four go partners? The chances would be more equal, and the cost would be much less."

"That seems reasonable," said Friedel. "I agree," answered Cyprien.

"Then," remarked Pantalacci, "it must be understood that each man retains his independence, and is free to leave his companions whenever he thinks fit."

"Of course," replied Hilton. "We club together to buy the waggon, the team, and the provender, but we can each leave when we please."

"Agreed," said Cyprien, Friedel, and Pantalacci.

"When will you start?" asked Watkins, whose chance of recovering his diamond was thus quadrupled.

"To-morrow, by the coach to Potchefstroom," answered Friedel; "there's no good thinking of getting there earlier."

"Right!"

As soon as this was settled Alice took Cyprien apart and asked him if he really believed that Matak! was the author of the theft.

"I am forced to confess," answered the engineer, "that all the presumptions are against him, chiefly on account of his flight. But I feel sure that Pantalacci has some interest in spinning things out as long as he can in regard to it. What a partner to work with! Well, all is fair in war. It is better to keep him in hand, and I can watch his movements more easily than by letting him go off by himself."

The four suitors soon bade farewell to Watkins and his daughter. As was only natural under the circumstances, the ceremony was a brief one, and consisted merely of a shake of the hand. What could the rivals say in thus going off together, each wishing the other at the bottom of the sea?

When he reached home Cyprien found Li and Bardik. The young Kaffir, since he had entered his service, had done his work most zealously. He and the Chinaman were having a quiet chat together, when the young engineer announced that he was going away with Friedel, Hilton, and the Neapolitan in chase of Matak!.

A look passed between them—only one. Then, without an allusion to the fugitive, they came up to Cyprien and said,

"Pa, take us with you."

"Take you with me? And why?"

"To do your cooking," said Bardik.

"To do your washing," said Li.

"And to stop the rascals from doing you harm," said both, in chorus.

Cyprien gave them a keen glance.

"Very well," he replied, "I will take you both, if you wish it."

Then he went out to bid good-bye to Vandergaart, who, without showing approval or disapproval of the expedition, shook him cordially by the hand and wished him success.

In the morning, as, followed by his two men, he walked down to the camp to join the coach for Potchefstroom, he lifted his eyes to Watkins Farm, which was still wrapped in sleep.

Was it an illusion? He thought he recognised behind the muslin curtain of one of the windows a slight girlish form waving a hand in token of farewell.

IVAN DOBROFF: A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,
Author of "Harold, the Boy-Earl," etc.

CHAPTER VI.—A STRANGE PROPOSAL.

WE left our hero in the care of a young woman whose appearance was in strong contrast with her surroundings. The two young people sat down to dinner in the company of the agreeable individual whom Ivan had nicknamed "The Cannibal."

The dinner was a very bountiful meal, and notwithstanding his exertions at the early luncheon which we have described, Ivan felt fully equal to the task before him, at which he worked "with a will," greatly to the surprise and amusement of the father of Annie'sie.

"Well," said this extraordinary being, when dinner was over, "you were afraid of my eating you; but if the question be raised as to which of us two is most likely to eat the other, I do not think there would be much room for doubt or very long discussion, Master Ivan the Terrible."

"Can you tell me what has become of Mr. Palitzki?" asked Ivan, rather timidly, of his host.

"No, Ivan, I cannot; but he has left the house and will not return until to-morrow."

"Then what is to become of me?"

"In the first place, I can assure you that no harm will befall you."

"I am not afraid for myself now, but only about Mr. Smirnoff."

"Does he not know that you were in charge of that excellent young man, your tutor?"

"Well, I suppose so, but I did not say good-bye, and how could he know what has become of me if Mr. Palitzki's friend did not give the letter? Oh, dear me! How thoughtless I am! I began a letter to Mr. Smirnoff and have not finished it. I meant to send it to him. Now it is late, too late for the post. But I should be very much obliged if you would allow a servant to take it to him."

"To-morrow morning, my dear boy, will be time enough. I do not care to send away my German servant at night, though he is generally away in the daytime on business. He has been in the Prussian army, and is very useful here. You have seen the class of Russians that hang about the court outside. I could not trust one of them, so we must wait until the morning, when I shall have the whole plan out of Palitzki."

"What plan do you mean?"

"My dear young Ivan, I shall really turn cannibal if you are so inquisitive! But I don't mind telling you that he is a very bad man, and never does anything without some special design. What his design was

in bringing you here I cannot now tell you, but to-morrow, after I have spoken to him, I will let you know. My advice is now that you go with Carl to the Baths near at hand, have a good warm bath, and then come back here and go to bed. Helena will give you a nice clean little bed, and as your clothes look too dirty for you to appear in the decent part of the town, we will try to find something that will suit you. Eleven years old and First Gymnasium; that ought to be able to produce a proper uniform in no time."

Ivan did not much like remaining where he was, but a look from Annie'sie reassured him; he therefore replied, "All right," and the bargain was complete.

After some talk with Annie'sie's father about the Prussian army, which delighted Ivan beyond any conversation he had ever had, our hero was carried off by Carl to the Russian bath, which is one of the great institutions of the country. Here he was stripped, rubbed, soaped, gently beaten with little boughs of trees on which the leaves were left, then plunged into cold water, next into hot,

"Means were found to equip Ivan as a girl."

then taken to a vapour room, where he was made to perspire freely, then plunged in tepid water, then put under a shower-bath of ice-cold water, then wrapped in a sheet and taken back to the first room, where he was placed on a couch for a given time, rubbed all over, and finally dressed and hurried by the German back to the House Hermann, into which he was now introduced by a different entrance. Before he knew where he was he found himself undressed and in bed in a charming little room, the furniture and linen being all new and clean.

When he had seen his charge to bed the Prussian withdrew, wishing Ivan "Good night." After he had left, the old female servant Helena entered the room with a cup of delicious coffee. This Ivan drank with great gusto, and then asked what had become of Annie.

"She is writing, but her room is next to this, and I sleep on the other side of the corridor. If you want anything in the night and just pull that bell-rope I will come directly."

"Why should I want anything? But many thanks all the same. I should like to say good night to Annie."

The old woman withdrew, and very soon after Annie popped her head into the room, saying, "Good night, little brother; I hope you will be all right to-morrow. Sleep soundly, and, queer as this place must seem to you, fear nothing. Say your prayers and do not forget your new sister in them."

"Good night, Annie." And she was gone.

It was very late the next morning before Ivan awoke. At first he rubbed his eyes and called aloud for Stephan—Saschinka—Gruscha. Becoming at last aware of his present position, he looked round him to examine the chamber. There was only one window, looking into the back court of the house, and that window was strongly barred. There was only one door, and that opened into another bedroom. It was not quite shut, and peeping in through the aperture he discovered that it was apparently the bedroom either of Annie or of some other young lady.

On a little table near the window he found his watch, his pocket-knife, his comb, and his pocket-book, in which were some bank-notes of small amount and some notes of lessons.

"Well," said Ivan to himself, "this is all right enough. Palitzki must be wrong about the Germans, and the priest is certainly wrong about the heretics if Annie is a specimen."

He now looked round for his clothes, and found on a chair, neatly folded up, a "ready-made suit" of plain clothes and a Gymnasium uniform with cap complete. "Come, that is very kind. I may choose which I like best. I vote for the greys."

When dressed he observed to himself that he felt much more of a "swell" than he ever did in the Loubiyanka; and then he rang his bell. In a moment after Helena appeared, and she, with the garb of the Russian servants, was loud in her praise of his appearance. Ivan presented her with a three-rouble note, and begged her to lead him to the sitting-room.

On entering what we have called the drawing-room he found Annie and her father already there, evidently waiting for him. On seeing him in his new clothes Annie sprang up, and clapping

her hands in glee, called him her delightful little brother.

"They are just the thing for you," said Hermann.

"Never had any half so jolly," he responded.

"Now, Ivan," said Hermann, "first get your breakfast and then we must have a talk."

This seemed a sensible idea to Ivan, who, like many boys at his age, was ludicrously attached to the pleasures of a good meal. He was not by any means a glutton, but he was growing fast. Breakfast was consumed almost in silence, Hermann remaining in the drawing-room while Annie went with Ivan into the dining-room to make his tea. At the conclusion of the meal, the "Cannibal" addressed his guest:

"I have seen Palitzki this morning, and am now able to explain his plan to you. A more nefarious one never was conceived. It appears that when he took you from Maziolovo he had just been dismissed by Mr. Smirnov, first, for neglect of you, and secondly, for belonging to an important political association of which you cannot understand the meaning."

"Nihilists?" asked Ivan.

"Patriots, who are doing their best to deliver this country from—"

"Never mind about that," said Ivan, "will they be good enough to deliver me?"

"Cleverly put, Ivan; you shall soon know. It seems that seeing you play with some children gave Palitzki the idea of making use of you as a means of getting money out of Smirnov, both for his own use and for the great cause. Now I am one of the leaders of this great movement towards freedom."

Ivan shuddered.

"Palitzki brought you here to hide you from Smirnov. He sought my aid, and as a commander of the 'Brotherhood' I dare not betray him, seeing that the success of his plan would further the good cause. Thus, however willing I might be to send you home to Mr. Smirnov, I dare not do so. Now, in placing you here, hidden in this way, you are lost—lost for ever. No one can find you here. The police are either in my pay, or dare not enter the house, for below are terrible vaults or cellars whence there is no escape, and the police themselves can never penetrate to them, although they know that members of the great police army of Moscow have died in these very cellars."

"What! under this house?"

"Under this very house."

"How horrible! Have you any there now?"

Hermann laughed, and exclaimed, "No, that was formerly. At present, my only prisoner is Palitzki."

"Oh, I say, what are you going to do with him?"

"Don't interrupt me so; I will tell you. His plan being to keep you here until Smirnov should pay a large sum to the 'cause' through Palitzki for your liberty, your tutor required a large portion of the money for himself. I threatened to expose him, or get a much larger part of the ransom for the 'Brotherhood,' but he reminded me that I could not betray him to the officials on account of my oath. If I write to Smirnov and tell him you are here, I excite the wrath of a very rich man, whose money would be more useful than his wrath."

"What are you going to do, then?"

"Don't interrupt me so. I shall now tell you. If I keep you here there may be a grand attack by the police on the house; the discovery of yourself and Palitzki in the cellars would do the cause much harm and bring it no money."

"Then you want me to go! I am quite ready."

"Stop a moment. Where are you to go to?"

"Back to Mr. Smirnov, of course."

"Gently, Ivan. I wonder that such a clever boy should say anything so silly. How can I tell whether you would not tell him all about us?"

"Word of honour."

"Word of fiddlesticks! Nonsense, Ivan; I can't afford to send you back without a reward being duly placed in my hands, and I can't afford to run the risk of keeping you here; I must send you away."

"All right. May I go now?"

Hermann laughed at the boy's eagerness. "Not just yet, Ivan. I must have the money, but I must have no risk. So I am going to send you to Kursk to the aunt of my daughter Annie."

"Delightful. Will Annie really travel with me? I suppose that is the reason why you have given me this grand new rig out. I am awfully pleased."

"Glad of it, Ivan; but you are wrong about the clothes. You see I may be compelled by the Brotherhood to release Palitzki. In that case he will go any lengths to find you, and the moment he does so he makes Smirnov pay an enormous sum for you. He will work upon the good merchant's fears and get a high price for you, and who knows to what den he may take you? This is bad enough."

"That's very true," said our hero.

"So," continued Hermann, "you must leave no trace behind you of your visit?"

"How do you mean?"

"Although I am not much afraid of the police, feeling some, frightening others, and making most of them think me a fool, there are many who watch very narrowly. The house is a 'suspected' house, and is constantly watched. Now if you leave in a drosky with Annie it would be known all over Moscow; you would be followed to the station, and telegraphed about all along the line. You must be disguised."

"All right! I will go as an Izvoschick or an English groom. I don't much care how, so long as it is neither a Jew nor a Tartar that I have to play."

"Neither one nor the other. You shall go as Annie's sister."

If Hermann had really been a cannibal, and had commenced preparations for making a meal on Ivan, that young gentleman could not have looked more scared. He stared first at one and then at the other in helpless dismay, but finally recovering himself, he said with decision and resolution,

"Not if I know it!"

Father and daughter regarded each other in silence, while Ivan walked coolly away, as if he had entirely dismissed the subject from his mind. He whistled unconcernedly as he strolled into the dining-room, and commenced a fresh attack on some jam with a spoon.

After a short pause Annie joined him, and tried to persuade him to adopt the proposed disguise, but he shook his head resolutely, exclaiming,

"Not like a girl. Anything else, but not as a girl. It won't do!"

"But," said Anniesie, very persuasively, "girls often dress like boys, and very nice they look too."

"Quite another question," said Ivan. "All girls would be boys if they could, but no boy that is worth anything would ever wish to be a girl. No, no, I tell you; it won't do!"

Finding him so determined, father and daughter gave up the attack for the present, and Hermann withdrew, suppressing his rising wrath as well he was able.

"Now, Ivan," said the girl when her father had gone, "you see that we are willing to show you every kindness, but the first suggestion we make to you, although for your good, you reject in the most decided way. As to disguising you like an Izvoschick, or any other boy, that is nonsense. I am going to travel with you, and as a boy I cannot take you with me."

"Why not?"

"Oh, it would never do. You would be found out directly, for the very fact of my travelling with a boy would make the police suspicious."

"Brother and sister?" said Ivan, curtly.

"Won't do; I must go with my passport, and I am known to have no brother, although the police do not know my real name. But I had a sister once; she is dead; she would have been about your age had she lived, and I could pass you off for her, for nobody here knows of her death."

"Something in that," said Ivan. "I'll think it over; meanwhile, what shall we do?"

"We will go and look at the horses presently, but you know I have not much time, and if you don't make up your mind to go with me as my sister I must go alone."

"You don't mean that? What would become of me?"

"You would be locked up in one of the safe cellars down stairs."

"Are the clothes here?"

"They are in my bedroom. Helena will help you dress."

"Don't like the whole thing. But what is to be done? Not going to stop in a cellar! Only look here! Can't I take my own things with me, so that I can come out in boy's clothes when I like? Or, stop, I have it! You have a taste for dressing up—all girls have. You get a boy's suit, and we will be two boys, eh? That's better, and you can't say anything against it."

"Yes, I can. You see we travel to my mother's sister near Kursk, and I must, when we get there, confide you to her keeping—"

"What! as a girl? Grow up a woman! Not if I know it! No, no! I will travel with you in any disguise you like except as a Tartar or a Jew. I will sham being a girl, even, just for the journey, but there it stops. Then I must have my own things again, or take the cellar lodging you spoke of until better times; but I will not go in petticoats any longer after the journey is over, that's all about it; so if you want the pleasure of my company those are the terms. I wonder that you, such a quiet, good girl as you are, should propose such a thing. When the cannibal suggested it I was not at all surprised; but you!—I am ashamed of you!"

This was a long and very philosophical speech for Ivan, and it evidently produced its effect on Anniesie, for she thought a little before she answered, which she did at last in these words:

"I am glad you are such a good boy as to do what I want you so far. I will ask my father about taking your dress with us, and if he consents of course I can say nothing. My wish is to make you as comfortable as I can."

"All right, ask your father. He is not so bad perhaps as he looks."

Anniesie here called Helena and directed her to go to Feodor Karlovitch, and to ask him to come to her at once. Ivan rolled upon the sofa with his feet in the air, and was just trying a sort of back somersault when the master of the house appeared.

"What is that boy up to now?" was a

not unnatural question under the circumstances.

"Taking leave of my liberty," was the reply of Ivan. "As long as I am a boy I'll be a boy."

"Well, Anniesie, you did not send for me to look at the child's gymnastics I am sure. What do you want?"

The girl explained the means by which she had so far talked Ivan over, and stated his firm objection to travel without having his boy's clothes to resume upon occasion, and his electing rather to remain in a cellar than go without this condition being fulfilled. After some thought Hermann decided on yielding this point, and then turning to Ivan, said in Russian (for he had been speaking German with his daughter),

"Now if I permit you to take your clothes with you I must insist on your conducting yourself quietly and properly during the trip, so as to bring no disagreeables upon us who are doing our best to get you into a comfortable home. If you play any tricks on the journey Anniesie will bring you back, and you will be locked up in a dark cellar until I make up my mind what to do with you."

"All right!" answered the boy, and the old woman Helena was forthwith charged with the task of completing his disguise. She carried him off a most unwilling captive, and it was long before, among the wonderful resources of that extraordinary place, means were found to equip our Ivan as a girl. A brown dress of the female Gymnasium student was altered to his size, and his hair was parted in the middle and flattened and smoothed, so as to become quite ladylike. But all his high spirits were gone; he was quite subdued by being thus compelled to assume a dress which he greatly despised, and he bitterly resented the insult in his heart of hearts. Unloving were the thoughts with which he regarded his former tutor for being the means of bringing him into this hobble. He fully resolved to be even with him should occasion serve.

(To be continued.)

GREAT AFRICAN EXPLORERS.

CAMERON.

CAMERON and Dillon left Zanzibar in January, 1873. They were at Unyanyembe in August, and thence decided to make their way by a new route to Tanganyika, north of that followed by Stanley and south of that of Burton and Speke. On the 9th November, 1873, they met the caravan with Livingstone's body, and then Dillon, who was ill, turned back, and Cameron went westward alone. Dillon soon afterwards died. The body was taken to the coast, and buried eventually in Westminster Abbey.

Cameron's progress was slow and sure. Resolving in no case to be the aggressor, he often had a very difficult and dangerous game to play amongst a people too prone to mistake forbearance for fear. That he succeeded in his attempt to cross the continent is sufficient testimony to his tact and good temper. The technical exploring was thoroughly and carefully done, and the survey of the lake is admitted on all hands to have been effected with marvellous accuracy and success. In all the levels and measurements the naval lieutenant's work was worthy of the service to which he belongs, and his

geographical and ethnological notes were very full and important.

The Sindi was crossed on the 2nd of February, 1874, on a mass of floating vegetation, one of the peculiarities of intertropical Africa. Many rivers for a great portion of their courses are studded with these islands, which when in good condition are frequently used both by man and beast as natural floating bridges. At the point where they crossed there was only a clear channel about two feet wide on each side, the remaining hundred yards of the river's width being covered with this vegetable growth, which extended about three quarters of a mile down the stream. Stepping on these islands is accompanied with much the same sensation as walking on a quaking bog overgrown with rushes and grass. On boring with a pole through about three feet of closely-matted vegetation mixed with soil the river is found, and the hippopotami pass underneath.

These masses vary in thickness and stability from year to year. They owe their origin to the rushes growing in the bed of the river, impeding the course of floating debris,

and causing it to accumulate and form soil for vegetation. Plants quickly spring up and flourish, and interlacing their roots a compact mass is the result. This continues to increase for about six years, when the limit is reached. Then the island begins to decay, and disappears altogether in about four years. Caravans sometimes pass over these islands when the stage of decay has already set in, and several have been lost in the attempt.

At Itambare Cameron was visited by the boy chief, only eight years old, who cried bitterly at the first sight of a white man, and had to be pacified with some cuts in a natural history book and sent away happy with a sheet or two of the "Illustrated News" that had been used for packing. At Lugva the explorer saw the men enjoying their liquid snuff, sniffing it up their noses and retaining it for many minutes by means of a pair of metal clips, carrying on the conversation meanwhile with the nippers on their noses.

At Uji the expedition refitted, and in May, 1874, a voyage was made to Ruanda, on the opposite coast, whence a start was made to survey the southern half of Tan-

ganyika, which was most efficiently done. At Ras Makurungwe one of the men accidentally shot himself, owing to his using the loaded rifle as a boathook and clawing at the boat's gunwale with the hammer.

Wonderful stories are told of the country round the lake. In one of the villages the people are said to live on friendly terms with the neighbouring lions, who walk in

bridge from swaying about. Across the lower pair of cables sticks were laid to form a roadway. These were lashed in their places and wattled in with creepers, while a large network of the same connected the upper and lower cables on each side of the bridge." This was the first and last bridge of the kind seen by the explorer.

Nyangwe was reached in August, and then

exception of the second wife. To her custom is more merciful than to her companions, and grants her the privilege of being killed before the huge grave is filled in. This being completed, a number of male slaves—sometimes forty or fifty—are slaughtered and their blood poured over the grave. After which the river is allowed to resume its course."

From stories of such hopeless brutality as this it is a relief to turn where some touch of human kindness is apparent, as in the legend of Lake Dilolo.

"Once upon a time where Lake Dilolo now is stood a large and prosperous village. The inhabitants were all rich and well-to-do, possessing large flocks of goats, many fowls and pigs, and plantations of corn and cassava, far exceeding anything that is now granted to mortals. They passed their time merrily in eating and drinking, and never thought of the morrow. One day an old and decrepit man came into this happy village and asked the inhabitants to take pity on him, as he was tired and hungry, and had a long journey to travel. No one took any notice of his requests, but he was instead pursued with scoffs and jeers, and the children were encouraged to throw dirt and mud at the unfortunate beggar and drive him out of the place. Hungry and footsore, he was going on his way, when a man, more charitable than his neighbours, accosted him and asked what he wanted. He said all he wanted was a drink of water, a little food, and somewhere to rest his weary head. The man took him into his hut, gave him water to drink, killed a goat, and soon set a plentiful mess of meat and porridge before him, and when he was satisfied gave him his own hut to sleep in. In the middle of the night the poor beggar got up and aroused the charitable man, saying, 'You have done me a good turn, and now I will do the same for you; but what I tell you none of your neighbours must know.' The charitable man promised to be as secret as the grave, on which the old man told him that in a few nights he would hear a great storm of wind and rain, and that when it commenced he must arise and fly with all his belongings. Having uttered this warning, the beggar departed. Two days afterwards the charitable man heard rain and wind such as never before, and he said, 'The words that the old man spoke are true.' He got up in haste, and, with his wives, goats, slaves, fowls, and all his property, left the doomed place safely. Next morning, where the village had stood was Lake Dilolo, and to the present day people camping on its banks or crossing in canoes on still nights can hear the sound of pounding corn, the songs of women, the crowing of cocks, and the bleating of goats. Such is the true and veracious legend of Lake Dilolo."

Commander V. L. Cameron, R.N.

and about the village without doing any injury. On great occasions the lions are treated to honey, goats, sheep, and ugali, and sometimes as many as two hundred of them come to the feast. Each lion has its own name, responds to it when called, and is mourned for when he dies as if he were one of the villagers! So the story goes.

The tale of the three trees of Urguru, not so very far away, is almost as strange as that of the upas-tree. Under their broad green foliage a tribe of Warori camped, and were found next morning to be all dead, their skeletons and the ivory they were carrying being left there to this day as witnessing the fact.

From Meketo to Kwamrora Kasea, Cameron passed through some of the grandest scenery of Equatorial Africa. On the 22nd of June he was at Kwasere, and shortly afterwards he camped at Koana Mina, looking down into enormous gullies and ravines where sunlight never falls and breezes never stir.

On July 18th he crossed the Lulindi, a broad stream unfordable in flood, and there, at a height of twenty feet above the water, he found a very cleverly constructed suspension-bridge. "Four large cables of creepers were fastened to the trunks of trees, one pair about four feet higher than the other, and to these cables were secured other creepers from the tops of the loftiest trees on each side of the stream, while horizontal guys prevented the

the course lay south-westerly. Lake Kassai, three hundred miles farther on, was visited from Kilemba; and from Kilemba, with many hardships and adventures, Cameron went on to Kalende, and then, having even had to sell his shirts for food, he crossed the Kakwevi river, and penetrating the mountainous districts, at last came out on the coast at Katombela a little north of Benguella.

Africa is a land with a future; in fact it is inconceivable that it can remain as it is. As described by Cameron and every other explorer, it is not so much emerging from barbarism as from brutality, and the picture of the manners and customs of its various tribes are often so appallingly horrible that it is difficult to believe we are really reading of men and women. As an instance take the following description of the funeral of a chief, such as Kasongo's father, when a hundred women perished.

"The first proceeding is to divert the course of a stream, and in its bed to dig an enormous pit, the bottom of which is then covered with living women. At one end a woman is placed on her hands and knees, and upon her back the dead chief covered with his beads and other treasures is seated, being supported on either side by one of his wives, while his second wife sits at his feet. The earth is then shovelled in on them, and all the women are buried alive, with the

CHESS.

Problem No. 91.

By H. F. L. MEYER.

White to play, and mate in four (4) moves.

The solvers should particularly state the use of the R's Pawns.

SOLUTIONS.

PROBLEM No. 85.—1, P takes Kt, becoming a Kt; R—K 4 (ch.). 2, B—B 5 (ch.), R × B (ch.) (or a). 3, Q × R mate.—(a) K moves. 3, Q—Q 3 or 7 (accordingly) mate.

PROBLEM No. 86.—1, Kt—Q 3, K—B 5 (or a). 2, P—K 4, K—Q 5. 3, R—Kt 4 mate.—(a) K—K 5. 2, K—B 3, K—K 6. 3, R—K 5 mate.

PROBLEM No. 87.—1, R—Kt 7, any move. 2, P—Q 8, becoming a Q mate.—There are seven variations, for the K has six flight squares, and is therefore mated on one of seven squares. In four cases the mating move attacks seven squares.—There might have been a black B instead of the Kt, and the R be placed on Q Kt square.

PROBLEM No. 88.—1, R—Q R 7, Kt—B 2. 2, P × Kt, K × R. 3, P—B 8, a Q, disc. check and mate, attacking at once seven squares of the K's domain, as in Problem No. 87.

GO-BAN.

(See pages 6, 31, and 62.)

GAME No. 3.

Played on the 14th of October, 1884, between A. A. (Black), and H. M. (White). Black's last move was from c5 to b4, and thus the following position was obtained in 17 moves.

White to play, and win in six moves.

The black men stand on the squares b3, b4, b5, d5, d6, e4, e5, e6, f1, f3, f8, and g2.

The solution will be published in a few weeks.

THE BOX-BOAT.

IN Max Adler's amusing book, "Out of the Hurly Burly," there is an interesting little anecdote of the sufferings of a small family who invested in a patent combination pair-of-steps-cum-sofa-cum-ironing-table contrivance in the hope that they could obtain three articles for the price of one.

The disasters begin when the machine is in the steps form. The maid is aloft dusting the parlour gas chimneys, when she happens accidentally to touch one of the springs. There is a sharp creak, the steps suddenly become an ironing-table, and the maid finds herself on the floor with the shattered glass around her. The next experience with the

arrangement is when it is in use as an ironing-table. A sudden jar is given by the flat-iron coming down too flat, or something of the sort, and before the cook can say Jack Robinson, iron, iron-stand, clothes, and ironing blanket are shot off in all directions, and the table whizzes up into its step-like shape. The third experience is with it as a sofa, when it rests in peace until sat upon by the cook and her admirer, when it deftly whips them off in opposite directions, clatters up into a table, and before they have time to secure it undergoes another transformation and opens out on end into the steps with which it began its career. In short the com-

bination proves too automatic, and is put away in the lumber-room, where it becomes a regular family ghost, and frequently indulges in a little performance all to itself.

Although the picture is somewhat overdrawn the moral it conveys is unfortunately a true one. Combination articles as a rule have the disadvantages of each of the combined articles and the full advantages of none. They, however, often afford convenient makeshifts, and it would be unfair to depreciate the ingenuity brought to bear in their construction, although we may take a respectable discount off the inventor's prospectus.

One of the most curious of recent American

"combinations" is the box-boat of which we give an illustration. In the one case we see it packed for travelling, in the other ready for use, as Mr. J. A. Olmstead, its inventor, has paddled in it in his many cruises.

It consists of three parts, which we have lettered A, B, and C. Each of these is complete in itself, and has closed ends. The frail section C has a lid and forms the box for clothes and stores. The central section D has the thwart for the occupant, and is strengthened by the triangular frame E, into which the bow of the boat is made to fit. The aft section A is also strengthened and cut out so as to overlap the bow. The sections are hinged, but the hinges are not quite as shown in the cut, for the bow folds over into the triangle at E, and the stern folds over the fore compartment and closes it tightly in. Beneath the box there is the space in B below the thwart, and in this the pointed sculls and other fixings are stowed.

The idea is, to say the least of it, ingenious. The box, fastened down by the crossed straps, is not an outsized one, nor is it too heavy, and the way in which the rowlocks are turned into handles is worthy of all praise. The material is wood, but the boat can be built of canvas and battens.

The difficulty would seem to be in firmly fixing the compartments together; and to those of our readers who may be fired with emulation to outdo Mr. Olmstead we would diffidently suggest that there is a possibility—just a little one—of the head and tail floating away and the boy in the box-boat suddenly finding himself in the wrong box.

A BEAUTIFUL LIFE.—The coloured sunset and the starry heavens, the beautiful mountains and the shining seas, the fragrant woods and the painted flowers, they are not half so beautiful as a soul that is serving Jesus out of love, in the wear and tear of common unpoetic life.—*Faber.*

NOW, NOT TO-MORROW.—In one of the meetings held in Edinburgh by Mr. Moody was a miner in his working clothes, sitting near the front, very attentive and impressed. At the close of the meeting he rose to go away; but, after walking down the passage, he turned and sat down again. His friend came up to him and said, "Come awa' hame, John." "No," said he; "I came here to get good, and I havena taken it a' in yet." So he waited. There was more prayer and another hymn, and special conversation with

himself. His heart was touched and changed. With his hard rough grip he shook the minister's hand, and said, "I have wondered if this might be true; I now believe it. It has brought peace to my soul. I know and trust my Saviour." On the next day, while working, a mass of coal or rock fell on him. The injuries were fatal. Death was close at hand. A fellow-workman approached him. "Bend down your ear to me," said the dying man; and then he added, "Oh, Andrew, I'm thankful I settled it last night."

FISHING FOR THE MONTH.

JANUARY.

Almost every river in this rain-favoured land of ours swells big with fluvial wrath some time during the winter, which has now fully set in.

This fact does not greatly affect the angler so far as the trout and salmon rivers are concerned, for the salmonidae are, as represented by trout and salmon, beginning to look after their conjugal affairs, and, therefore, are but sparsely sought after by the fishermen. But in the case of coarse-fish rivers, such as the Thames, Colne, Trent, Wey, *et hoc genus*, the floods are a bugbear to any but the most proficient angler. Lagoons have formed where river water naturally stood, eddies smile with dark-faced mirth where never dimpling eddy within his recollection before appeared—in a word, the stream is probably two feet higher than its normal height in midsummer's prime.

Where are now your well-known swims? Your gravelly four-foot roach swim, with its attendant two-mile-an-hour current, has now a depth of six feet, and hastens away at double the previous rate. Dace and gudgeon, chub and barbel, have deserted their old quarters. The voracious pike is not to be found near that patch of weeds which, as they slowly moved a week ago, was so beloved of his pikeship. The perch no longer haunts the hidden camp-seathing. Disgusted, you tumble together all the carefully prepared ground-bait, the gentles, lob-worms, meal-worms, Cleopatra's spinning-baits, and the rest of your paraphernalia, and get away home.

This, reader, is what the imperfectly informed angler would do in flood time.

Not so the local and observant angler, to whom the movements and features of the stream are as well known as the features of those he loves. To him flood-time fishing is by no means hopeless, and, given simply a flush of water in winter, without the accompaniment of sleet and incessant wind and rain, and he will—if, of course, he be, as I say, an observant boy—make good use of the uncomfortable results of the weather. He knows that, like even man, sparrows and swallows, and nearly every other animal, there is an instinct of migration in fishes.

Coarse fish, it is true, do not go down to the sea like salmon; neither, he it said, do sparrows pass to other lands like the swallow; yet who will say that the London sparrow in winter is not the bird whose unrest in the sunny suburban hedgerows in spring and summer charms us with his pert twitter? Assuredly all fish migrate for climatic and other reasons, and the floods are generally the inaugural signal of such a change of habitat. My suppositious observant angler is supposed to have noted the peculiarities of such alteration of covert, and hence his increment of sport as compared with the ordinary town-bred fisherman.

Of course, however, it is not given to all anglers to be able to observe the curious phenomena of piscine life, and so to know how to overcome the disabilities which wind and weather create. The object of this paper, therefore, is to point out such salient differ-

ences of habitat of the chief of the coarse fish in season throughout the probable flood time as may enable the angler to fish, flood notwithstanding, and catch fish. The motif of such teaching is surely a good one, for it is one thing to know where fish are in clear, unswollen water, and a supremely and widely different one to be able to put your bait into their mouths when the bottom cannot be seen beneath six inches of water and the ordinary haunts are altered in features so greatly as to be almost unrecognisable.

For the sake of adding to the practical value of this short article, I will suppose a river like the Thames risen over its banks until the grass-lined shores are part of the river. The position of the angler, if possible, should be arranged according to this, for it is seldom that a flood arises because of water falling in the lower parts of any stream. Therefore the sagacious angler places himself below a flood if he desires to benefit by its occasional undoubted advantage.

Perchance he desires roach. Formerly he found them about half a dozen yards from the shore, on a nice gravelly bottom, the water about five feet in depth. Where are they now? I answer, Watch for a quiet lagoon behind some jutting obstruction on the submerged grass, perhaps not more than two feet deep. Stand some distance from it, and having previously scoured some lobworms in moss till they are coral-headed and opal-tailed, throw them in broadcast, so that the slow stream, if there be one, may carry them to the bottom in the centre of the almost stagnant water. The roach are commonly to be found in such a spot in flood time, and besides their desire to get away from the thick rough stream which has taken the place of their former home with its current translucent and gentle, they also seek such quiet for the sake of the earthworms they can gather from the soil and the softer parts of the grass-blades, of which, by-the-by, all the carp family are fond. Let the angler use fine tackle—it can never be too fine if he can use it without breaking—and that of the "Nottingham" style.

This "Nottingham" style of tackle, by the way, must be explained, for there are yet many people who are unaware of its distinctive features or its excellence. Briefly, let us say, a roach-rod of this make is about twelve feet long, and of a deal, butt and second joint and lancewood top, of course beautifully tapered, and as light in the hand compared with its actual weight as a jockey in the saddle compared with his dead weight. This lightness enables the angler to use, without undue chance of smashing, the exquisitely fine tackles made by the Trent fishers. The line is usually a silk twist, as fine as sewing-cotton, and the hook for roach is a round bend of medium size and long-shanked.

In seeking for barbel in flood time it must be borne in mind that this is a fluvial fish, and, therefore, is ever found where there is a promise of shelter and earth-flood. More so even than roach is it fond of the tender parts of grass and the various earthworms which the water either washes into retired places or entices from underground. Yet in the daytime it is not unusual for barbel to seek the upper banks, unless when the weather be warm and dull and the angler be extremely quiet. It rather seeks the immediate neighbourhood of the real bank which the flood has hidden, and if, therefore, by plumbing the depths, or by other means, the fisher can ascertain the exact whereabouts of this real bank, and fish outside, he will not fail to find *Cyprinus barbatus*. Of course, that is if such a spot be contiguous to a barbel deep, which in normal seasons produces the fish. No better bait can be used than the tail of a lob, and leger or float tackle, according to the angler's taste. These have been described already.

Perch and chub may be sought for in flood-time in situations contiguous to old submerged trees, round which oily eddies form, making capital covert. Let it not be supposed, however, that I suggest perch and chub in fraternity. "The loggerhead" is much too nearly related to the carps to fraternise to any appreciable extent with the "hog-backed" perch. Besides, the latter fishes form communities of their own as winter approaches, and are often as densely packed as sheep in a fold during an east wind. Much more so at this time are they like sheep than is the roach, though Walton dubbed the latter "water-sheep;" for if a perch be hooked and lost, it instantly speeds away, and is followed by the whole shoal, not to return till the panic has been quite forgotten. Red-worms from a well-rotted manure-heap, at flood-time are a capital lure; so are pieces of fresh beef, and even the tail of a prawn (skinned) has been known by the writer to do uncommon execution.

As to chub, they can be got in the deepest lagoons and quietest spots in the river. If the temperature fall to freezing-point, they descend in the river correspondingly; and one often has to fish some six feet in flood or winter time, when three feet would be amply deep enough. A common horse-leech is a fine bait in spring flood-time; the tail of a boiled crayfish, and the world-wide famous pith-and-brains of a bullock, not forgetting a piece of Gruyere cheese or Cheddar—all these are food for the chub.

And Jack are to be taken by paternostering in quiet situations also. Poor fellow! If we can pity a trout with a pair of jaws over which Dante's "Voi ch' entrate lasciate ogi speranza" might be fitly written, his lot is harder than all others, for the muddy water obscures his Argus eye, and denies him the silvery dace and succulent gudgeon. Besides, he delights in clearer water than do other fish, and the muddiness of flood waterirks him—renders him gloomy, taciturn, saturnine, sulky.

But touch him on the tail with the plummet of your paternoster, and round he turns upon the bait. True to his instincts—more true than other fish—he always seeks the neighbourhood of rushes, and best sport will always be got with pike just as the water clears. His

gift of vision is stronger than that of the vision he preys on, and, therefore, it is harvest-time for the pike when the clearing water allows him to hunt, and is not as yet lucid enough to enable his prey to see their destroyer.

The sum and substance of the proper method of winter flood-fishing consists in the certainty that each

fish desires quieter quarters than the accelerated stream would allow in their whilom coverts. Just in proportion as the stream originally was wild or slow, and making allowance for the desire on the part of the fish, as with other animals, for an equable temperature, so will their haunts be found altered.

J. H. K.

THE POULTRY RUN.—No doubt by this time any new beginners in the poultry world will have quite prepared a place for their coming feathered stock, and those who have been keeping birds for a season or two will have had all repairs completed a month or more ago. The latter will by this time know by experience—dearly bought, perhaps—that there are certain things necessary for the bare existence of fowls in a state of health. Let me recapitulate these: (1) Room enough outside and in. (2) Space for exercise. (Where fowls have neither a large yard nor run, remember that much good is done by throwing garden refuse of various kinds into the run, mixing it with a handful or two of oats or barley. This gives the birds something to do, and tends to keep them healthy.) (3) Shelter from wet and stormy weather. (4) A dust bath. (5) Perfect cleanliness—perfect cleaning, methodical and regular. (6) Pure water, changed often, the dish or pan containing it being rinsed so as to be free from dirt and slime; and (7) good food suited for fowls.

Fowls mope and sicken, give up laying, "dwine," and die, for many reasons; but the chief generators of disease in the runs are wet and cold, and poison. Poison is a stiff word to use, we admit, but we repeat it—poison! And where does this poison come from? Why, it is generated in the run when not kept sufficiently dry and clean; it is generated in the nests when allowed to get dusty and filthy; in their bodies when a good dust bath is not allowed them; and in the water when not changed often enough, or if allowed to stand in a place where all kinds of mess get into it. The poison is also generated in the food or food dishes if allowed to get dirty or sour.

Now, we care not how well-arranged your run and fowl-house may be, if you do not feed well and judiciously your fowls will bring you no profit, but a deal of bother and loss.

To the older boy fancier we say, then, before you increase your stock reform your plan of diet; and to the beginner we add—learn to feed before you buy a single bird. Anything will not do for fowls. The kitchen scraps, vegetables, plate scrapings, bones, bits of pudding, and garbage of all kinds thrown into a big dish and allowed to ferment, and a handful of corn now and then when you think of it—this, we assure you, may suit a pig, but not a laying fowl, nor a fowl you want to form flesh and look handsome in plumage. We do from the bottom of our heart pity the poor bedraggled hens and cocks we see sometimes in cottagers' yards while riding about the country. Puny, woe-begone wretches, with tails that trail, white faces, discontented, pleading looks, moulting all the year round, and hungry enough to fight with each other for the carcass of a bluebottle-fly or a bumble-bee. But then it is such an easy thing to feed well if you know how to, and only take the trouble. Three times a day your birds should be fed—early in the morning, at midday, and before going to roost. Morning feed: Your soft scraps and kitchen-stuff—fresh, and fresh every day—mixed into half-dry lumps with bran or pollard or oatmeal dust, and thrown on a clean place

for them. Midday: Grains thrown about or among the garden rubbish you have put in the run. Evening meal: Grains again. What grains? Any grains, if good and cheap, and the oftener they are changed the better.

If you are going to set fowls now, put them in a warm, sheltered, quiet nook, on dry earth or ashes, the bed of fine straw above this, and place food and water handy. Feed well in cold weather. A little cayenne and bullocks' lights, well boiled and finely chopped, will not be thrown away on laying fowls. If you have chickens this month you cannot feed too often, nor keep them too warm and snug—not hot, though. See that every bird in the run gets a due proportion of food, because the big will bully the little, and the cocks—the more gallant breeds—will stand aside and starve to see the hens feed.

THE PIGEON LOFT.—Are you all repaired, and clean, and tidy for the coming season? Quite sure there are no nasty crevices about, that will get filled up with dust and filth, and breed disease when the weather gets warm? Have a look around and see. Stop up all cracks, and you will be on the safe side. The weather will often be stormy and cold this month; be certain there is no inlet for positive draughts. Ventilation is a fine thing, but it must be managed somewhat scientifically; a current of air blowing directly in upon a bird's perch may work mischief that will cost you both trouble and money. If you should have a bird with cold, moping, and without appetite, and his feathers all awry, away with him to the hospital pen, in a warm corner. Illness in a pigeon is bad to cure; if it is to be checked at all it must be taken at once. Do whitewashing only on fine days, and disinfect ladders, etc.; but do not forget that cleanliness is by far and away the best disinfectant. Last year we find we gave directions for making dove-cotes. A capital time of the year this is for doing carpentry of all kinds. You can always work indoors. Have you tools? If not, we earnestly advise you to get good ones, and not toy boxes, which are usually made to sell. Tools can always be got second-hand in towns very cheaply. The commoner kinds of pigeons do very well in dove-cotes erected either on a pole in yard or garden, or against a wall where vagrant cats cannot get at them.

THE AVIARY.—There is still nothing to be done in the canary world. Just continue to make your birds

as happy and comfortable as possible. Feed and water them as nearly as possible at the same time every morning; they will soon know the time, and look for your attentions with pleasure. If dainties are ever permissible it is now, especially in cold weather.

Consider your mating arrangements, and if you mean to go in for any new kinds, study those well. If you are buying birds for the coming season, get them only from good breeders. It is easy to get the addresses of prize-winning breeders; you have only to write for a catalogue to the secretary of some past show.

THE RABBITRY.—Continue to preserve your rabbits' health; large roomy hutches that do not leak, plenty of clean bedding and good food, with exercise when the weather is dry and sunny, will keep them healthy, bright-eyed, and happy.

THE KENNEL.—Look out for stormy weather. Feed extra well, and give more bedding than usual. Have the kennel door turned away from the prevailing wind, and mind the wet does not get inside. Do not let indoor pet dogs loll much before the fire, and if long-coated, such as the Yorkshire terrier or Maltese, remember the bed should not be soft, else the coat will be sure to come out.

DOMESTIC PETS.—This is a new paragraph for our DOINGS. It is the month of January, a good month for starting innovations. We mean to give hints under this heading about a variety of pets. We have not much space, so must try to make our suggestions useful and to the point. Cats in this country are hardly yet properly understood. Many people do not feed their pussies at all, and make a point of turning them out of doors. Hence they become thieves, and are destitute of any natural affection for their thoughtless owners. A cat should be fed twice a day at least, and have meat once a day, or fish, if that can be had. She ought to have fresh milk every morning, and not only milk, but water as well. Feed the last thing at night, and this will keep pussy in all night. More about cats in our next.

THE KITCHEN GARDEN.—In last year's DOINGS for January we say, "Dig a trench, and throw up the ground as roughly as possible, the object being to permit the frost to get thoroughly in to kill the weed-seeds and weed-roots." Good advice, but it ought to have commenced "Dig and trench." So there, it is never too late to mend even a printer's mistake. There is little else to be done, but you may still get manure out, and get everything as far ahead in the shape of repairs to walks and borders as possible, and hedges and trees kept trim.

THE FLOWER AND WINDOW GARDEN.—Spring flowers may be planted and borders arranged, and even beds laid out and made, but everything depends upon the weather. If your flower-boxes for your windows are not done, do them, and you can get wire trellis-work arranged up the sides of the window, and your flower-baskets ready.

Correspondence.

S. J. JACKSON.—You will find detailed instructions in making holly-bark birdlime in No. 223, in the May part for 1883. We cannot repeat.

H. SHUTTLEWORTH.—For the Navy you have to be specially trained in the Marlborough; for the merchant service you must be apprenticed to some firm. Inexperienced men are not taken to sea in the engine-room.

MEDEA.—You will find an excellent criticism on Hamlet in Goethe's "Wilhelm Meister." Get the original, or Carlyle's translation.

W. J. R.—A melancholy instance of the literal interpretation of a lecturer's simile. The iron exposed to sea water readily rusts or oxydises, and your friend must have jumped to the conclusion that that which is oxydised must be heated to redness.

AN ENTOMOLOGIST.—The articles on setting and preserving insects, by Rev. J. G. Wood, were in the first volume. The numbers have long been out of print, and you can only obtain them in the volume, price 6s., or in monthly parts.

YACHTSMAN.—Buy the indexes to the last four volumes, and choose for yourself among the mass of information we have from time to time given on building model yachts. You would find Mr. Ashworth's articles in the second volume of considerable use to you.

A. J. C.—Of the three chess books named we should give the preference to Staunton's Handbook.

A SUBSCRIBER FOR ABOUT FOUR YEARS.—All in good time. Meanwhile you would find Newman's "British Ferns," published at two shillings by Van Voorst, of Paternoster Row, of great service to you. It not only gives the botanical descriptions, but the mode of cultivation. We have a coloured plate of ferns preparing for issue.

SPOTTED CRAKE.—We do not sell the plates separately. You must buy the parts or the packet. All the coloured plates are available in volume form.

CHILBLAINS.—From "an interested reader" we hear that he cures his broken chilblains by wrapping them in a rag spread with "pommade divine," and gently bathing them with warm water when the rag is changed; and he generally prevents them from breaking by rubbing them well every day with camphorated oil. To which we add that if boys subject to chilblains will rub their feet with vaseline they will find their torture at an end. Chilblains will not come if the feet are kept warm and the circulation unchecked. It is on account of the warmth obtained that peoples in frigid countries eat and dress themselves with grease.

C. P. E.—How to grow your whiskers, and what to do to increase your height? Our advice is not to handicap your growth in any way; any extra weight above is prejudicial, hence always wear a very light hat, keep your hair cut very short, and postpone raising your whisker crop until you are long enough to carry it with safety!

C. HAZLEWOOD.—What difference there is in taste, and how manifold are people's troubles! No sooner have we soothed a youth who wants to grow tall by telling him to keep his hair cut short and reduce his top-heaviness, than you send in for information how to keep stunted and how to cultivate your head-thatch. Keep your hair as short as you can get it, and diminish your apparent height by broadening your shoulders.

PERCY W. S.—You will find the changes in the cricket field at each over given in Dr. W. G. Grace's articles in the second volume.

L. W. D.—Plaster-of-Paris tinted to the colour of the wood you wish to imitate makes a very good "filler," and so does putty properly coloured. To make deal look like mahogany stain it with some of Stephens's wood stains, which you can get from any oilshop. You can there also buy French polish. If you prefer to make it yourself, take an ounce of shellac, add an ounce of gum lac, and half an ounce of sandarac, and warm them until they dissolve in a quart of spirits of wine. Dip a piece of flannel in the polish, and then covering it with a soft linen rag, wait till the polish oozes through, and slightly moisten the pad with raw linseed oil. Rub at first in a circular direction. You will find full instructions on polishing in the fifth volume, and many hints scattered through the correspondence of that and the preceding volumes, for which see the indexes.

MODELLER.—The articles on "Cardboard Modelling" were in the fifth volume.

CONSTANT READER.—The reason you received no reply is that your signature renders you practically anonymous. We have dozens of "Constant Readers" writing by every post, and it would be impossible to distinguish them. Put your initials, put anything you like, but pray do not retain the "Constant Reader." By the-by, how does it happen that a "constant reader from the first" has never heard of "The Two Cabin Boys"? Did he become inconstant for half a volume?

W. J. SCHOFIELD.—1. Apply to Messrs Cooke and Co., Museum Street, W.C., or any natural history specimen dealer, for the price of eggs. 2. Grease the saw—always grease a saw. 3. You can get fretwork patterns from Churchill and Co., Sun Street, Finsbury, and all vendors of fret saws.

FRANCAIS.—From any newsagent. Several of the French newspapers are now sold at the railway bookstalls. Try at Victoria or Cannon Street.

SAILOR BOY.

—Apply at the nearest post-office for Government pamphlet on how to enter the Navy. It will give you the latest and clearest information. It cannot be too widely known that persons desirous of entering either of the services can now obtain particulars from the postmasters.

R. O. H.—"Rank Marks of the Royal Navy" was in the February part for 1884. "My Flagstaff, and how I rigged it," was in the second volume.

A. G. R., AN IRISHMAN, ETC.—For price of the packets of plates, see the last number in September of each year.

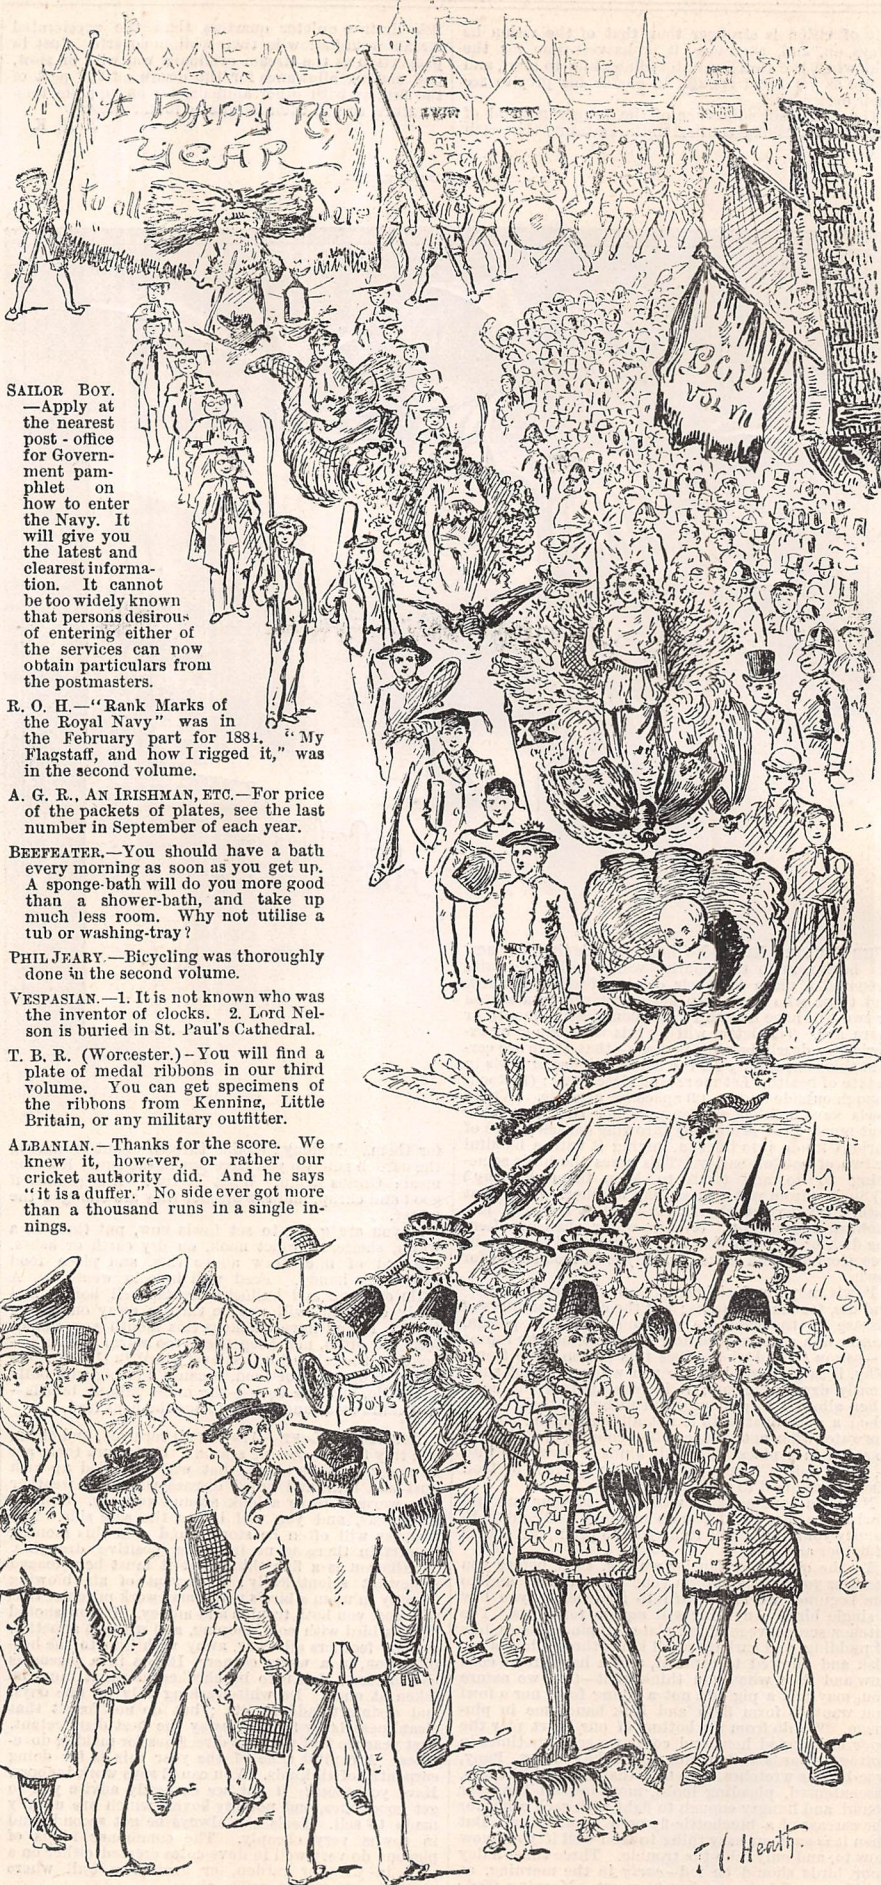

BEEFEATER.—You should have a bath every morning as soon as you get up. A sponge-bath will do you more good than a shower-bath, and take up much less room. Why not utilise a tub or washing-tray?

PHIL JEARY.—Bicycling was thoroughly done in the second volume.

VESPASIAN.—1. It is not known who was the inventor of clocks. 2. Lord Nelson is buried in St. Paul's Cathedral.

T. B. R. (Worcester.)—You will find a plate of medal ribbons in our third volume. You can get specimens of the ribbons from Kenning, Little Britain, or any military outfitter.

ALBANIAN.—Thanks for the score. We knew it, however, or rather our cricket authority did. And he says "it is a duffer." No side ever got more than a thousand runs in a single innings.

No. 313.—Vol. VII.

SATURDAY, JANUARY 10, 1885.

Price One Penny.

SCHOOL AND THE WORLD.

CHAPTER XXI.

THE party was a great success. Soady distinguished himself greatly, making up in good-nature what he lacked in experience. No one seemed to notice his dress coat, which rather annoyed him.

"Never mind," said Tommy, consolingly; "they think you've had one a long time; that's flattering to you."

That view commended itself to Soady, and he was comforted.

Next day he set off for town. But before detailing his adventures there we must return to Lang.

He spent a week at Mr. Porter's, a week full of painful anticipations to him, and then came the first day of the examination.

What a scoundrel he felt as he crept out of the house,

to spend the time as best he might till he could return home again. He would

"Well, Mr. Lang, how are you?"

not have gone near the university for anything. His one fear was that he might meet some one he knew.

If he should do so, what excuse could he offer for his absence from the exam.? He forgot that not one person out of a hundred knows the exact date of the matriculation. To his excited imagination every one had his eye on him, and was saying to himself, "How is it that young fellow is out in the streets whilst his examination is going on?"

In fact the danger was sufficiently real, though by no means great. Most of Lang's friends knew he was in town, and there was the risk that Soady or Garland, or some other schoolfellow, would hang about Burlington Gardens, just to hear how things were going. Then two or three of the fellows at Mr. Porter's knew he was going up; suppose they should meet him?

This was his chief dread. He had refused to make any acquaintances at his coach's, so that he feared no questioning, but it would be very awkward if they met him. He slinked along back streets, looking so suspicious that several people turned round to gaze after him; he was afraid to go into any decent thoroughfare. Strange to say, he had not made up his mind how to spend his day. One thing soon became certain, however: he must spend it out of town.

He took the train for Kew, thinking he would spend the miserable hours in the gardens. He arrived there at a quarter-past ten. To his dismay he found the gates were not opened till one o'clock. What was he to do in the interval?

It was an unpleasant January day, cold and bitter. To add to his troubles it began to sleet. He could not walk about in the miserable weather, that bade fair to last; there was nothing for it but to go to an inn, and there idle away the hours as best he might.

He went into the first that offered. He ordered some beer, not that he wanted it, for the smell of the place made him nearly sick. He sat down on a hard bench and took up the morning paper.

He was as miserable as he could well be, but persuaded himself he had one consolation—no one would be likely to see him there. Of all unlikely places for any one in his senses to go to spend a morning, the bar of a small inn bears the palm.

He had been there about an hour, had read the paper through, advertisements and all, and was beginning to fancy that the landlord was looking at him unpleasantly, when the door opened and a young fellow of about twenty-five entered.

He nodded to Lang as if he had known him all his life, walked to the bar, and called for a drink to keep the cold out. Then he came over and sat by Lang.

The newcomer was rather loudly dressed, but had a free-and-easy way with him that was taking enough. However, Lang's chief desire was to be left alone, so he took up his glass as the other sat down and pretended to take a drink from it.

The stranger waited till he put down his tumbler, and then held out his hand.

"Well, Mr. Lang, how are you?"

If he had been shot Lang could scarcely have been more startled. To think that he had been hiding all the morning in this out-of-the-way place, and the first man who saw him knew him!

"You seem surprised," said his companion. "Don't you be afraid, I'm Jim Bayliss, pretty well known through England, you may bet. You didn't think I knew your name, did you?"

"No," said Lang; "I don't remember having seen you before."

Mr. Bayliss laughed long and loud; he was evidently immensely tickled at something.

A terrible thought came into Lang's mind. Mr. Bayliss said he was well known through England. Was it possible he was a detective, and that he had come down to arrest him?

"Spending the day here?" asked Mr. Bayliss, lightly. "Not the pleasantest place to do it."

"I was taking shelter," stammered Lang.

He did not like his companion's manner. He would not stay near him any longer. He went to the bar, paid, and then made for the door.

"Wait a moment, Mr. Lang," said Mr. Bayliss. "I should like just half a word with you."

This was terrible. Lang could not reply. "I'm afraid I startled you with coming out with your name so pat. But you needn't be frightened; I ain't going to bite. I saw your name on your collar as you leant forward to drink your beer. No offence, I hope; I only meant a joke."

"No offence," repeated Lang. "Good morning; I'm in a hurry."

He pushed open the swing door and ran out.

"Well," said Mr. Bayliss to the barman, "he didn't look in much of a hurry when I came in. He doesn't seem able to stand my society, eh, Jim?"

"It's good enough for me," replied Jim, with a grin.

"Yes, I dare say it is, so long as you can keep me emptying my pocket and filling yours," retorted Mr. Bayliss, who was perfectly aware he was going to the dogs, but made no effort to stop himself.

Meanwhile Lang ran back to the station, relieved beyond measure to find that all his fear was unnecessary. None the less, the remembrance of that fear stayed with him, and he was far from as comfortable as he could have wished.

He missed the train he hoped to catch; in fact his day was one series of misfortunes. It was getting on for lunch time, too, and he was growing hungry. He could not make up his mind whether to return to London and have something to eat, or remain at Kew and visit the gardens.

He decided on the former; he could go to an eating-house and stay there till the time of the close of the examination. However, he had to wait an hour for a train, and a dismal hour it was. He bought a paper, but did not read half of it. He sat over the waiting-room fire, wishing with all his heart he were in Fanshawe's place and Fanshawe in his.

CHAPTER XXII.

SOADY meant business in London. He persuaded his people that if he lodged at a coach's the presence of so many other fellows would interfere with his evening work, so permission was given for him to occupy lodgings. This plan entirely approved itself to his sisters, who promised themselves pleasant visits to his rooms.

"You must have a piano, Dick," said Belle.

"Kindly produce your piano," was his reply.

"And mind you have plenty of plates and things, so that when we come to tea you won't run short."

"Bless the girl!" exclaimed Soady; "are you under the impression that I'm going to keep house for your benefit?"

"Then you won't get that pair of slippers I'm working for you," said Belle.

"All right; I'll get mother to work me some."

There had been an unexpected announcement of an examination for the Civil Service in a month's time. Soady was greatly exercised about it, not knowing whether to go in or not. His father recommended him to leave it to his tutor, and that he resolved to do.

His coach was the Rev. Peter King, a Fellow of Trinity, and a sound scholar. He had a brother a barrister, who assisted him by taking in hand those pupils who were aiming at Law.

Soady heard of it through Garland, who was to enter the Church. Garland wrote him a very pleasant letter in reply to his inquiry for a coach, and said that he was going to read with Mr. King for six months before entering for Christ's College, and that if Soady could work under the same tutor it would be very jolly.

Soady was delighted at the prospect. He had the highest opinion of Garland—as indeed had every one—and was sure that his assistance would be invaluable. Besides, Garland was a steady fellow, not noisy or racketsy, and until he was serving his country as a clerk Soady meant to eschew even the most harmless amusements.

The first thing was to get a lodging. The Rev. P. King lived in a square in Bloomsbury, so that Soady began exploring that neighbourhood for rooms. His mother wished to come up with him, but Mr. Soady dissuaded her.

"He's no time to lose," he said, "and he will settle down more quickly if alone. He's old enough to look after himself, and a little experience won't do him any harm."

So Soady was put down at Euston with his portmanteau, a homeless wanderer. He left his baggage in the cloak-room, and then set off on foot to explore.

He tried Gower Street first. One house had "Apartments" in the window. He knocked, and asked to see them. They were very nice—gas laid on, every possible convenience, and a piano thrown in. Soady thought he had fallen on his feet the very first try.

"When do you want to come in, sir?" asked the servant, who was showing him round.

"At once," said Soady. "I've got my portmanteau at Euston."

"Oh, these won't be vacant till Lady Day, sir."

That was a facer, and Soady was indignant.

"Then what do you mean by putting up a notice in the window?" he asked.

"That's missis," was the reply of the girl, who seemed to think that was an all-sufficient reason.

Soady had no time to waste, so he left the house without further delay. He turned to the left soon, and tried some of the smaller streets. Plenty of rooms to let there.

"Some of these ought to do," he thought; "I'm not hard to please."

But he had to confess, in the course of an hour, that he was harder to please than he imagined. One set of rooms was unfurnished; he wanted furnished. At one house the look of the servant who opened the door was enough to take away his appetite for a week; at another they could not give him attendance. He tried patiently every house in the street that exhibited a card in the window, but it was all in vain.

At last he came to the corner house; the door was in the street, but the frontage faced a fine square. He scarcely expected to have found apartments let in such a house, but the card was in the fanlight over the door, so he boldly knocked.

"You have some rooms to let?"

"Yes, sir. Will you step inside?" said the servant.

"Could I occupy them at once?" asked Soady, made wary by his former experiences.

"Oh, yes, sir; they are quite vacant."

He followed the girl upstairs to the first-floor. There were two rooms—one a fine one—and a bath-room. The furniture was excellent, and the appointments seemed admirable.

"I will fetch Mrs. Lingard," said the servant, seeing that Soady seemed pleased.

Whilst she was gone Soady took a look around.

"These will suit me, I fancy," he said to himself. "I'm afraid the figure will be rather high, though. But pater wouldn't mind stretching a point to get me rooms so nice as these."

The amount which he was authorised to give was £1 a week. Soady was under the impression that £50 a year was enough to secure a house almost.

Mrs. Lingard appeared, and asked him to be seated.

"You can give me references, of course?" she asked.

"Oh, yes," said Soady; "any number."

"Will you want much attendance?"

Soady detailed his modest requirements, and then hesitatingly asked what was the rent. Everything seemed going on so nicely, it was a pity to have to ask such a question.

"With attendance, it will be three guineas a week," said Mrs. Lingard, quietly; "but that will not include gas or firing."

"Of course not," replied Soady.

Three guineas a week! Did she take him for a millionaire? It was flattering, but he wished he had not come into the place. The question was how to get out of it without a loss of dignity, for he shrank from telling this ladylike person that he could only give a pound.

A happy thought struck him. He put on a careless look, as if the price suited him admirably, and asked, lightly, "I suppose you have stables attached?"

"I'm sorry to say we have not," Mrs. Lingard replied, greatly to his relief.

"That's a pity," said Soady, gravely.

"I dare say you could get your horse taken care of at the livery stables in the next street."

"I'm afraid that would hardly do," said Soady, thoughtfully. "I've never kept a horse at livery yet, and I do not feel inclined to try."

"I'm sorry," said Mrs. Lingard.

"I'm sorry to have troubled you," replied Soady, rising.

"Oh, don't mention it. You might think it over, and if you change your mind perhaps you will let me know?"

"Certainly, I will be sure to remember."

Mrs. Lingard rang the bell for the servant to show him out. He did not breathe freely till he was in the street; then he began to laugh.

"I'm well out of that," he thought; "but what an impostor I am. I wonder if she saw through me. It's evident I've got a lot to learn about London. Who could have guessed they would have wanted a hundred and fifty a year for

two rooms and a bath? I must reduce my expectations."

He was getting weary of the search, when he saw a house that seemed to promise well. He entered it, and found two very tolerable rooms on the second-floor, which were to be let furnished for nineteen shillings a week. Mrs. Smith, the landlady, impressed him favourably, and the servant was not objectionable. In five minutes after his knock at the door he was no longer a houseless nomad, but an established lodger at No. 15A, King Street, W.C.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XIII.—ACROSS THE TRANSVAAL.

ON arriving at Potchefstroom the four travellers ascertained that a young Kaffir, whose description tallied with that of Matak, had passed through there the evening before. This promised well for the success of the expedition. But it seemed as though the enterprise would take some time, as the fugitive had provided himself with a light carriage drawn by an ostrich, and thus rendered it no easy matter to catch him.

For there are few better goers than these birds, either on the score of endurance or speed. Ostriches of burden,

however, are somewhat rare, owing to the difficulty in breaking them in. Hence neither Cyprien nor his companions could obtain any at Potchefstroom, and Matak was off to the north with a good start and an animal that could put a dozen horses on their mettle.

The only thing left was to follow him as quickly as possible. He had a great advantage in his superior speed as against that obtainable from the mode of locomotion his pursuers intended to adopt. But the strength of the ostrich has its limits. Matak would be obliged to halt

"Bardik knows the desert, and says that that horse is not salted."

for a time, and if the worst came to the worst was sure to be caught at the end of his journey.

Cyprien soon had cause to congratulate

"Why not? Are you trying the medicine-man business?"

"No, pa; but Bardik knows the desert, and says that that horse is not salted."

"The waggon drawn by a dozen red and black oxen."

himself on having brought Li and Bardik with him when he set about procuring his outfit. It was no easy matter to select only such articles as were useful and necessary. There is no guide like experience. Cyprien was an excellent hand at the calculus, but of the A B C of Veld life, of life "on trek," he knew nothing. And his companions, instead of helping him with their advice, showed rather a tendency to lead him astray.

As far as the tilted waggon, the team of oxen, and the bulk of the commissariat were concerned, there was no difficulty. Mutual interest commanded that these should be judiciously chosen, and Hilton acquitted himself to perfection. But it was not so with matters that were left to individual choice, such for example as buying a horse.

Cyprien had noticed in the market a good-looking three-year-old, whose price was not excessive. He had tried his seat, found it suited him, and was about to hand over the money, when Bardik took him aside and said,

"Are you going to buy that horse?"

"Yes. It is the best I can find at the price."

"It is not worth having as a gift," answered the Kaffir. "It won't stand a week's travel."

"Not salted? Do you want me then to buy a horse in a cask?"

"No, pa; but it means that he has not had the Veld disease. He must have it soon, and then if it does not kill him it will make him useless."

"Oh," said Cyprien, thinking there was something in the caution after all. "What is the disease?"

"A burning fever and a cough," said Bardik. "You must not buy a horse that has not had it. You can easily see those that have—and once they have had it they very seldom catch it again."

There was no excuse for hesitation under such circumstances. Cyprien postponed matters and went in search of further information. Everybody he asked confirmed what he had heard from Bardik. The fact was so notorious that it was seldom mentioned.

Having been put on his guard, the engineer became more prudent, and betook himself to a veterinary surgeon. Thanks to his guidance, he in a few hours secured the very mount most suitable for his purpose, in the shape of an old grey horse consisting of nothing but skin and bone, and only possessing a fragment of tail. That he had been "salted" was obvious enough from his appearance; and, although his trot was rather stilted,

he was evidently a good one to go if a poor one to look at. Templar—such was his name—enjoyed quite a reputation in the country for endurance, and when Bardik had inspected him—for the Kaffir was of course consulted—he declared himself thoroughly satisfied.

Bardik himself was specially entrusted with the management of the waggon and the team, and therein had considerable assistance from Li. No mounts had to be bought for them, and Cyprien's horse-dealing terminated with his paying for his own steed.

Another difficult matter was the selection of the battery. Cyprien at last decided on a Martini-Henry and a Remington, which, though not very elegant in appearance, was a straight shooter and a rapid loader. One thing he would not have thought of had the Chinaman not suggested it to him, and that was a stock of explosive bullets. He had imagined that five or six hundred cartridges would be sufficient, and was greatly surprised to find that four thousand was the minimum prudence demanded in this land of wild beasts and savage men.

Cyprien also purchased a couple of revolvers with explosive bullets, and completed his armament by securing a superb hunting-knife, which for five years had hung in the window of the gun-maker at Potchefstroom without any inquiry being made for it.

It was now bought to please Li, he having assured Cyprien that nothing would turn out more useful than this knife, and the trouble he afterwards took in sharpening and polishing it showed that confidence in the cold steel which he shared with the rest of his race.

Of course the famous red box went with the careful Chinaman. In it he stowed away with other mysterious articles about sixty yards of fine strong line. When he was asked what it was for, he replied, evasively,

"Have not your clothes got to be dried in the bush as well as anywhere else?"

In twelve hours the purchases were all made. Waterproofs, wrappers, cooking utensils, tinned provisions, yokes, chains, spare harness, were stowed at the back of the waggon, and formed the basis of the general store. The front of the waggon was littered with straw, and served as the bedroom and shelter for Cyprien and his companions.

Hilton had done his part of the work thoroughly well, and seemed to have omitted nothing they were likely to require. He was very vain of his colonial experience, and to show his superiority, rather than from any feeling of friendliness, favoured his companions with a good deal of information on the customs of the Veld.

At last Pantalacci interrupted him with,

"What makes you want to tell the Frenchman all that? Do you want to see him win the prize? If I were you I would keep all I knew to myself."

Hilton regarded the Italian with sincere admiration.

"That is a good notion of yours. Such an idea would not have occurred to me."

Cyprien had honestly told Friedel what he had learned about the horses of the country, but to no purpose. The German thought no one knew anything but himself, and bought the youngest and most fiery steed he could—the very

one that Cyprien had refused. He also laid in a stock of fishing tackle, asserting that there would be no lack of sport.

The preparations were finished at last, and the caravan formed up in the order it was to keep on the march.

The waggon, drawn by a dozen red and black oxen, went first in charge of Bardik. Sometimes the Kaffir, whip in hand, walked by the side of his team; sometimes he took his seat in the front of the chariot, where, regardless of the jolting, he sat in triumph, enchanted with his mode of locomotion. The four horsemen formed the front and rear guards, except at such times as they separated to shoot a little game or make a reconnaissance.

After a very brief consultation it had been decided to make for the source of the Limpopo. All advices tended to show that Matakai was following this road—and, in fact, he could not well take another if his intention was to get as far from the British possessions as soon as he could. The Kaffir had an advantage over his pursuers in his perfect knowledge of the country and the lightness of his equipage. He obviously knew where he was going, and the best road to take thither, and, thanks to his friends in the north, he was sure of welcome and shelter, and even help if he wished it. There was indeed a chance that he might raise his tribe and turn to bay on those who were chasing him. Cyprien and his comrades were fully aware of this, and appreciated the need of their travelling together for their mutual safety and ultimate success.

The Transvaal, which they intended to cross from south to north, is that vast region of Equatorial Africa lying between the Vaal and the Limpopo. Geographically, it is divided into three regions—the table-land, or Hooze Veld; the hill country, or Banken Veld; and the Bush Veld.

The table-land is the most southerly; it is formed by the mountain chains, which extend westwards and southwards from the Drakenberg. It is the mining country of the Transvaal, and the climate is as cold and as dry as that of the Bernese Oberland.

The Banken Veld is more particularly the agricultural district. Extending along the north of the Hooze Veld, its deep valleys drained by pleasant water-courses, and shaded by evergreen trees, are inhabited by the descendants of the Dutch.

The Bush Veld—the hunting-ground of the Transvaal—comprises the wide rolling plains stretching up to the banks of the Limpopo towards the north, and to Bechuanaland towards the east.

Leaving Potchefstroom in the Banken Veld, they had to cross diagonally nearly the whole of it before reaching the Bush Veld. This first part of the Transvaal offered few difficulties to their progress. They were still in a half-civilised country. The worst that could happen was a wheel stuck fast in the mud or a sick ox. Wild ducks, partridges, and antelopes abounded, and each day furnished an ample breakfast or dinner. The night was spent at some farm, whose inhabitants, isolated from the rest of the world for three-quarters of the year, were sincerely glad to receive their guests.

At almost every farm they stopped at they heard news of Matakai. Everywhere he had been seen to pass in his ostrich

carriage; at first, two or three days in advance, then five or six, then seven or eight. Evidently they were on his track, but evidently also he was gaining rapidly on his pursuers, who, however, felt sure of catching him at last.

Cyprien and his three companions began to take things easy, and to amuse themselves in their special ways. The engineer made a collection of rock specimens, the German botanised, Pantalacci tormented Bardik and Li, and atoned for his buffoonery by making delicious dishes of macaroni at every halt. Hilton's business was to keep the caravan provisioned with game, and hardly a day passed in which he did not bring down his six brace of partridges, his score of quails, and occasionally a wild boar or an antelope.

By easy stages they reached the Bush Veld. The farms became fewer, and at last disappeared altogether. The travellers were on the extreme verge of civilisation. Henceforth they had to camp out at nights; huge fires had to be lighted for men and cattle to sleep round, and a constant watch had to be kept.

The country became wilder. Stretches of yellow sand, clumps of thorn bushes, and at long intervals a marshy stream or so, took the place of the green valleys of the Banken Veld. Now and then the

to fifteen feet high, with numerous branches spread out almost horizontally, and armed with spines from two to four inches in length, as hard and sharp as daggers.

This outer zone of the Bush Veld is generally known as the Lion Veld, but it hardly seemed to justify its name, for after three days' working through it not a lion had been seen.

"The name," said Cyprien, "is probably traditional, and the lions have long since retired to the desert."

But Hilton laughed.

"You don't believe in the lions? That is because you don't know how to look for them."

"Not see a lion in the middle of a naked flat like this!" said Cyprien, ironically.

"Well, I will bet you ten pounds," said Hilton, "that in less than an hour I show you one you didn't see."

"I never bet, on principle," said Cyprien, "but I shall be glad to see your lion, all the same."

The journey was continued. For about half an hour all went well, and nothing was said about lions, when suddenly Hilton exclaimed,

"Do you see that anthill over there on the right?"

"How beautiful!" said Friedel. "We

"Cyprien gave his horse the spur, and trotted off."

underwood was so thick and thorny that instead of keeping on its straight course the caravan had to go some distance round. The thorn-trees were from nine

have seen nothing else but those things for the last three days."

And, in fact, nothing is more common in the Bush Veld than these huge yellow

mounds, built up by ants innumerable, and, with the few clumps of straggling mimosas, forming the only break in the plain's monotony.

Hilton laughed sarcastically.

"Mr. Cyprien," he said, "if you like to take the trouble of galloping over there—where I am pointing with my finger—you will see what you want. Don't you go too near, however, or you may come to grief."

Cyprien gave his horse the spur, and trotted off.

"That is a family of lions over there," said the German as soon as he was out of earshot. "One out of every ten of those anthills is not an anthill."

"Per Bacco!" exclaimed Pantalacci; "you need not have told him not to go too close." And, noticing that Bardik and Li were listening, he added, "He'll get awfully scared, and we shall have the pleasure of a good laugh at him."

The Italian was wrong. Cyprien was not the man to "get awfully scared," as he phrased it. A couple of hundred yards from the "anthill" he saw what it was. An enormous lion, a lioness, and three pups were stretched on the ground like cats, and quietly sleeping in the sun.

At the sound of Templar's hoofs the lion opened his eyes, raised his huge head, and yawned. As he did so there appeared between the two rows of powerful teeth a deep wide throat, down which a child might easily have dropped. Then he glared at the horseman, who had pulled up about twenty yards away.

Fortunately the lion was not hungry, and so he did not trouble himself to move.

Cyprien, with his hand on his rifle, waited for a minute or two, and then, seeing that the lion had no desire to commence hostilities, and not having the heart to spoil the happiness of the interesting family, turned round and ambled off to his companions, who could not help recognising his coolness and pluck.

"I should have lost my bet, Mr. Hilton," was all he said.

That evening they halted near the right bank of the Limpopo. There, in spite of all that Hilton could say, Friedel went out to fish.

"It is a dangerous game, I tell you," said the Englishman. "In the Bush Veld people never hang about water-courses after sundown. Never—"

"So!" said the German. "Well, then, I'll be different."

"What harm can there be," said Pantalacci, "in his going down to the river bank for an hour or two? I have often spent half the day wet through to the armpits when I have been after wild duck."

"That is not at all the same thing," said Hilton, again endeavouring to stop Friedel.

"Oh! Bother!" answered the Italian. "My dear Hilton, just hand us over that tin of scraped cheese for the macaroni, and let our friend go and catch us a few fish for supper. We want a change!"

Friedel went off, and kept his line in so long that it was quite night when he returned. Then he made a hearty meal off the fish he had caught, and when he went to bed in the waggon complained of a slight shivering. In the morning when they rose to depart he was in a violent fever, and found it impossible to mount his horse. Nevertheless he insisted on

their starting, affirming that he would be all right on the straw.

They did as he requested.

At noon he was delirious.

At three o'clock he was dead!

"You see," said Hilton, philosophically, "I was right when I said that you mustn't hang about water-courses after sundown."

They halted for a few minutes to bury the corpse, that they could not leave to the mercy of the wild beasts. It was that of a rival, perhaps of an enemy, and yet Cyprien felt profoundly moved as the last sad rites were accomplished. The spectacle of death, solemn and impressive as it is everywhere, seemed to gain increased solemnity in the desert, for in Nature's presence man is more fully conscious of his own inevitable end. Far from his friends, far from all who loved him, his melancholy thoughts flew back to home. "Perhaps," thought he, "I myself may lie on this plain never again to rise; perhaps I may be buried in a sandhill, capped with a bare stone, and have no friend to soothe my last moments." And thus putting himself in his comrade's place, and pitying him, he felt as though a part of himself lay buried there.

The day after the mournful ceremony Friedel's horse was seized with the Veld disease, and in a few hours followed his master to the grave.

(To be continued.)

HEROES OF THE BACKWOODS.

I.—ROBERT ROGERS.

February, 1759.

BROTHER UNCAS.—As it is for the advantage of King George to have a large body of Rangers for the next campaign, and being well convinced of your attachment, I wish, in pursuance of General Amherst's orders, to engage your assistance here early in the spring. Should you choose to come out as captain you shall have a commission; if not, I shall expect Doquipe and Nunnipad. You shall choose the ensign and sergeant. The company should consist of fifty men or more. . . .

Your humble servant,

R. ROGERS.

So, under date February, 1759, runs the letter addressed to the Mohican chief by the man who raised and headed the famous Rangers whose exploits furnished Fenimore Cooper with the groundwork of his tales of the "Leatherstocking."

How strange it seems to find in sober history the records of the deeds of the bush campaigns of Montcalm and Howe and Wolfe and Amherst, and the scouting feats of the Indians and backwoodsmen in the long French War which ended in the fall of Quebec and Montreal! Indians on the warpath, scalps and moccasins, tomahawks and pipes of peace, straight shooting and swift canoeing, untiring marching and unflinching tracking, seem to belong so exclusively to fiction, that it is almost distressing to us to find, after all, that they really belong to fact, and that he who likes can find them duly chronicled in official despatches!

Robert Rogers, the Ranger, afterwards Major Rogers, was born in New Hampshire, like most of those he led. During the French War the need of a body of men used to the ways of the woods and able to beat the Indians at their own mode of warfare, soon became manifest, and in 1755 steps were taken to organise a corps of seasoned backwoodsmen, whose duties were to scour the

woods and ascertain the forces and position of the enemy; to discover and devise ambuscades; to acquire information by capturing sentinels and messengers; and, in short, to be thoroughly adept in all the duties of partisan war.

Rogers, a tall, athletic man, of great presence of mind, intrepidity, and perseverance, had early distinguished himself by his skill in woodcraft, and from the first was held in high esteem by the British regulars, who, with their knapsacks, belts, and pipe-clay, had been turned into the primeval forest to fight the active Indians with the stiff geometrical drill introduced into Europe by King Frederick the Great. The journal in which his proceedings are recorded begins on the 24th September, 1755, with his expedition with four companions to Lake George, and it ends with the expedition to Detroit, and his return to Lord Amherst on 14th February, 1761. After the conclusion of the peace Rogers came to England and lived here till 1775, when he returned to America to be denounced by Washington as a British agent and forbidden to enter the Colonists' camp.

On March 23, 1756, the first regular commission to raise the Rangers was issued, and Rogers soon found himself at the head of sixty of the toughest specimens of humanity ever brought together. In Natty Bumppo Cooper has drawn the type of the scout, with considerable accentuation, of course; and of good old Natty, Rogers's men were very rough examples. In those days, thanks to the wild Indians, some fighting for France, some for Britain, men were not over particular; and with English scalps bought in by the French at sixty livres each, and English prisoners sold in Canada at fifty crowns apiece, the cruelties of war were indulged in to the full.

The first exploit of the sixty was the expedition up to New Charleston, then known as Number Four, when it was learnt among other things that a new general with two veteran regiments had arrived from France to press on the war. The new general was Montcalm, and matters up Ticonderoga way looked very blue for the eventual success of the British. On August 25 Rogers and five-and-twenty men were dispatched to reconnoitre this famous strategic point, then called by the French Carillon. The duty fulfilled, he was out again in September on a similar errand with fourteen men in a whaleboat. In January a stiff battle took place in the neighbourhood, in which the Rangers fought long and desperately, and so useful had they become that in February Rogers was empowered to raise more men. In July an expedition took place into Nova Scotia, about forty of the Rangers being told off to scout along the Bay of Fundy. And in fact the Rangers became invaluable, and were sent everywhere to clear the country and check the Redskin tactics.

Year by year the companies were increased, until Rogers at last found himself at the head of several hundred men. To give the details of their hairbreadth escapes and wonderful deeds of endurance is impossible here. We can but take a typical instance or so.

As a sample of the sort of fighting that took place in these American wild woods we may allow Rogers to tell in his own words the story of the great battle in the snow on the 13th of March, 1758:—

"Left our camp at sunrise on the twelfth, and having made about three miles, perceived a dog running across Lake George, and sent a party to reconnoitre the island, supposing the Indians were there in ambush; but not finding any, it was thought proper to take to the shore, and thus prevent our being discovered from the surrounding hills. We halted at a place called Sabbath Day Point, on the west shore, and sent down parties to look down the lake with perspective glasses. As soon as it was dark we proceeded down the lake. Lieutenant Phillips, with fifteen men, some of whom preceded him on skates, acted as an advance guard, while Ensign Ross flanked us on the left, under the west

shore, near which we kept the main body, marching as closely as possible to prevent separation, the night being extremely dark. In this manner we came within eight miles of the French advance, when Mr. Phillips sent back a man on skates to desire me to halt. Upon this the men were ordered to sit down on the ice. Mr. Phillips soon after came to me, informing me that he had discovered what he supposed to be a fire on the east shore, but he was uncertain. I sent him, accompanied by a Mr. White, to ascertain the fact. They returned in an hour fully persuaded that a party of the enemy were encamped at the place. The advanced guard was then called in, and we marched to the west shore, where in a thicket we concealed our sleighs and packs.

"Leaving a small guard with our baggage, we marched to attack the enemy's encampment if we should find one. On reaching the place where we supposed the fire had been seen, and finding no enemy, we concluded Mr. Phillips had mistaken some patches of snow, or pieces of rotten wood, for fire (which in the night and at a distance they resemble); we therefore returned to our packs and passed the night without fire. On the morning of the 13th a council of the officers determined that our better course was to proceed by land on snowshoes, lest the enemy should discover us on the lake. Accordingly we continued our march on the western shore, keeping on the back of the mountains which overlooked the French advanced guard, and halted at twelve o'clock two miles west of them, where we refreshed ourselves until three. This was to afford the day scout from the fort time to return home before we advanced, as our intention was to ambush some of the woods leading to the fort that night, in order to trepan the enemy in the morning. Our detachment now advanced in two divisions. On our left, at a small distance, we were flanked by a rivulet, and by a steep mountain on the right. Our main body kept close under the mountain, that the advanced guard might better observe the brook, on the ice of which they might travel, as the snow was now four feet deep, which made the travelling very bad even with snowshoes. In this manner we proceeded a mile and a half, when our advance signalled the enemy in sight; and soon after, that the force consisted of ninety-six, chiefly Indians.

"We immediately threw down our knapsacks and prepared for battle, supposing that the whole of the enemy's force was approaching our left upon the ice of the rivulet. Ensign McDonald was ordered to take command of the advance guard, which, as we faced to the left, became a flanking party to our right. We marched within a few yards of the bank, which was higher than the ground we occupied; and observing the ground gradually descend from the rivulet to the foot of the mountain, we extended our line along the bank far enough to command the whole of the enemy at once. Waiting until their front was nearly opposite our left wing, I fired a gun as a signal for a general discharge. We gave them the first fire, which killed more than forty, and put the remainder to flight, in which one half of my men pursued and cut down several more of them. I now imagined they were totally defeated, and ordered Ensign McDonald to head the flying remains of them that none should escape.

"He soon ascertained that the party we had routed was only the advance guard of six hundred Canadians and Indians who were now coming up to attack the Rangers. The latter retreated to their own ground, and regained it with the loss of fifty killed. Then they were drawn up in good order and fought with much intrepidity, keeping up such a constant and well-directed fire as caused the French, though seven to one in number, to retreat a second time. We, however, being in no condition to pursue, they rallied again, recovered their lost ground, and made a

desperate attack upon our front and wings, but they were so warmly received that their flanking bodies soon retreated to their main body with great loss. This threw the whole in confusion and caused a third retreat. Our numbers were now too far reduced to take advantage of their disorder, and rallying again they attacked us a fourth time.

"Two hundred Indians were now discovered ascending the mountain on the right to possess themselves of the rising ground and fall upon our rear. Lieutenant Phillips, with eighteen men, was directed to gain possession of it before them, and drive the Indians back. He succeeded in gaining the summit, and repulsed them by a well-directed fire, in which every bullet killed its man. I now became alarmed lest the enemy should go round on our left and take post on the other part of the hill, and sent Lieutenant Crafton with fifteen men to anticipate them. Soon afterwards I sent two gentlemen who were volunteers with a few men to support him, which they did with great bravery. These gentlemen were officers of the line who had been desirous of witnessing an Indian fight. I had previously requested them to retire and offered a sergeant to conduct them. They at first accepted the offer, but being unused to snowshoes, unacquainted with the woods, and seeing us closely beset by the Indians, painted in the most hideous manner, and making the mountains ring with their horrid yells, like gallant men came back to our assistance.

"The enemy pressed us so closely in front that the parties were sometimes intermixed, and in general not more than twenty yards asunder. A constant fire continued for an hour and a half, during which time we lost eight officers and a hundred privates killed upon the spot. After doing all that brave men could do, the Rangers were compelled to break, each man looking out for himself. I ran up the hill followed by twenty men towards Phillips and Crafton, where we stopped, and gave the Indians, who were pursuing in great numbers, another fire, which killed several and wounded others. Phillips and his party capitulated to about three hundred Indians, and though he was promised quarter, they tied him and his men to trees and hewed them to pieces."

Rogers and his party escaped by sliding down a sloping eminence of a hundred feet to the river below, and the place is still pointed out as "Rogers's Slide." The number of the

enemy was seven hundred, and of these six hundred were Indians. Rogers's battles generally ended in the other fashion, but we have given this as being the longest in which large numbers were engaged.

For the five years during which the war continued after the formation of the Rangers, hardly a week elapsed but what some daring deed was done or thrilling adventure took place such as would seem to have been accidentally omitted from Cooper's romances. On one occasion Rogers penetrated for over five hundred miles into the enemy's country!

The journal of the scout is the story of a group of men who went with their lives in their hands and did their perilous duties with marvellous success. In the woods or on the lakes, summer and winter, on the ice or the water, the Rangers seem to have been equally at home. Take for instance, in conclusion, Rogers's descent of the river from Coos to Number Four to bring back food for his starving men:—

"Captain Ogden, myself, and a captive Indian boy embarked upon a raft of dry pine-trees. The current carried us down the stream in the middle of the river, where we kept our miserable vessel with such paddles as could be split and hewn with small hatchets. The second day we reached White River Falls, and very narrowly escaped running over them. The raft went over and was lost, but our remaining strength enabled us to land and march by the falls. At the foot of them Captain Ogden killed some red squirrels and also a partridge, while I attempted to construct another raft. Not being able to cut the trees, I burnt them down, and burnt them at proper lengths. This was our third day's work after leaving our companions. The next day we floated down to Wattoquichie Falls, which are about fifty yards in length. Here we landed, and Captain Ogden held the raft by a hazel withe while I went below the falls to swim on board and paddle it ashore, this being our only hope for life, as we had not strength sufficient to make a new raft should this be lost. I succeeded in securing it, and next morning we floated down within a short distance of Number Four. Here we found several men cutting timber, who relieved and assisted us to the fort. A canoe was immediately dispatched up the river with provisions, and it reached the men at Coos on the tenth day after my departure, as I had promised."

A DUCK FOR A SLEEP;

OR, NEW YEAR'S DAY AT CALAIS UNDER THE TUDOR RÉGIME.

ONE of our artists has made for us a capital sketch of an incident in our national history not generally known perhaps even amongst historical bookworms, and yet of a semi-ludicrous character that boys will know how to enjoy.

During the occupation of Calais by the English, if a sentinel was found asleep at his post he was punished by being swung over the ramparts in a basket, with a loaf of bread, a jar of water, and a knife; there he remained until he had pluck to cut the rope and get a ducking in the moat, a boat being placed all ready to rescue him. We append full particulars of the curious custom.

Strict watch and ward were kept at Calais, according to "good, old, and wholesome laws." A knight or master porter, a gentleman porter, with a staff of subordinates, superintended the opening and closing of the gates. This was performed with considerable ceremony at appointed hours.

During the night there was a "scout watch" to perambulate without the walls, a "stand watch" to set as sentinels upon them, a "burgess watch" specially appointed for the castle hill, and a "search watch" to see that others did their duty.

The punishment prescribed for a sentinel caught napping was curious enough. If the search watch found any of the stand watch sleeping three times in one night the culprit was handed over the day following to the lord-deputy. On the next market day he was slung in a basket over the town wall, some ten or twelve feet above the water of the moat, and left suspended, having a loaf of bread, a pot of drink, and a knife with him. This provender being consumed, he must obviously either starve and perish or cut the rope with his knife and precipitate himself into the moat.

There was, however, little risk of being drowned, as one of the moat-keepers was always in attendance with a boat to "take him up when he falleth."

Perhaps the patience of the attendant was sometimes exhausted by the tardy proceedings, and urgent appeals were made to the suspended John to pluck up his courage and take it like a man, cut the rope, and drop into the water. The ducking over, the delinquent was confined in the mayor's prison till the next market day, and then publicly banished from the place for one year and a day.

New Year's Day at Calais.—See p. 231.

IVAN DOBROFF: A RUSSIAN STORY.

BY PROF. J. F. HODGETTS,

*Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science.**Author of "Harold, the Boy-Earl," etc.*

CHAPTER VII.—LOST.

"They saw a young girl struggling with another."

IVAN's belongings had been packed in a little box. He had been provided with a dozen shirts and other necessities in a way which to him seemed almost miraculous. Annie opened the trunk, and showed him that her gift of Robinson Crusoe had not been forgotten, and somehow this little matter touched the boy's heart wonderfully. Still, he was far from being convinced that it was "all right." Sometimes he felt as though he was acting very foolishly in going away at all, but

then he felt that the people among whom he found himself had the power in their hands to do with him as they would, and that up to the present moment he had been kindly treated. Yet feeling himself a prisoner was bitter enough to one who had all along been in the enjoyment of liberty and the power of free locomotion. He was but a boy, though a clever one, and a Russian.

When the Russians are in a dilemma the rule is to do nothing, but allow affairs

to develop themselves, the ordinary phrase on such an occasion being, "What is to be done?" meaning there is nothing to be done. Something of this almost Asiatic phlegm might be seen in the manner in which Ivan resigned himself to fate, while ever and anon there came a flash of higher feeling which prompted him to action. He did not forget in all his mental trouble and affliction to reward those who had ministered to his comfort, and Helena received a gratuity

that made her fall on her knees straight away and demand special protection from her saint for him.

A ragged idler was sent for an izvos-chick for our hero, but before getting into the vehicle he insisted on seeing that his own masculine garments were really and truly safely packed at the bottom of the box. The police under whose surveillance the house stood saw, when the prelotkah (a kind of hooded gig) passed out of the courtyard, a very pretty German-looking young woman, well, but not showily dressed, accompanied by a shy, awkward girl, in the Gymnasium uniform, who seemed very much inclined to withdraw from public notice and hide herself in a corner of the vehicle. The sharp eyes of the police, however, detected nothing more, and no conclusions appear to have been drawn by them at the time.

The vehicle rattled through the miserable district, but soon got into the grand street, called the Tverskaya. Here Annie-sie began to regret having undertaken the adventure, for the awkwardness and shyness of Ivan seemed to increase as they came into the more public thoroughfare of the town. Fortunately the driver took a route leading through the less frequented parts of Moscow, and by the time the Kursk railway was reached her fears had in part subsided. She had originally resolved to travel third class, but Ivan's queer expression of disgust, dislike, and utter misery made her alter her plan. It was less likely that he would be noticed, she thought, by first-class passengers than by the ever communicative and chatty frequenters of the cheaper carriages.

So the two companions entered a first-class carriage. The guard, attracted by the strange, scared look of Ivan, asked Annie-sie whether her sister were ill.

"She has been overworked to pass into the fifth class," said Annie-sie. "I should be so thankful if you could let us have the coupée to ourselves during the journey."

Here Ivan interrupted with, "What are you talking about the fifth class? That shows what girls know of such things. Didn't you know that Palitzki was coaching me for third?"

To any one with less presence of mind than Annie-sie this would have been fatal, but she had too much ready wit to allow herself to be daunted, so she said, with the greatest assurance,

"You see, now, with her mind in such a state, how very necessary it is for us to be alone. Pray accept this for your trouble in securing the coupée for us." And she placed a three-rouble note, of the value of about six shillings, in his willing hands, saying as she did so, "If you can keep us quite to ourselves during the whole journey I will give you another at the end."

"Many thanks, Barishnya (young lady). I will not admit a soul, and when you want refreshments you can tell me, and I will bring them to you."

Annie-sie was congratulating herself upon the success with which she had overcome her first danger, when two boys in the summer uniform of the Imperial Gymnasium — unbleached linen tunics and trousers, the uniform belt and silver clasp, and the white summer cap, with its silver badge of two sprigs of laurel surrounding the device, M. 1st K. G. (Moscow First Classical Gymnasium) — passed the window. Instantly Ivan

sprang up and shouted, "Abrazoff, Popoff! come here! Help! rescue me! Don't you know me?" The boys stopped and looked at the window whence the sounds proceeded, and saw a young girl in the Gymnasium dress of the female pupils struggling with another, who seemed much older than she. They were about to rush to the coupée where these two girls sat, but the signal was given, the train was in motion, they lost their places, and had to remain behind!

"Who was it? She seemed to know us both and called for help. Did you recognise her?"

"I certainly have heard the voice before and must have seen the face, but I cannot remember where. The tones were well known to me."

"Strange thing, though! How the big girl pulled down the little one and held her hand over her mouth! It was a fine struggle. I never saw the big girl before."

"Well, Popoff, it can't be helped. We have missed the train all through the botheration girls, and now we shall be late at Faustova."

At the next station the guard approached, and asked whether refreshments were required, or whether he could be of service in any way.

"We can dine in the coupée, can't we?" was the response.

"Oh, certainly. You will find a mahogany flap before you below the window. Raise this and fix it by the bracket, and there you have a table. What would you like to order?"

Annie-sie gave a very fair order for dinner; indeed it would have been a fair order for twice their number, but Ivan pricked up his ears when he heard it and forgot for the moment the shame of his position in delightful anticipation of the dinner that was to come.

As soon as the train was again in motion Annie-sie began to cry bitterly. This was too much for Ivan, who said at last,

"Look here, Annie-sie, you have not been bad to me, though I hate these horrid things you make me wear, and if you will give me my own dress at the end of the journey and not cry, I will be quiet until we get to Kursk, or wherever it is we are going."

"You are a good boy, Ivan," she replied, "and I promise to let you have your things immediately on our arrival at my aunt's if you sit still and make no more efforts to escape or to attract the notice of those about us."

"All right."

The bargain thus struck there was no further effort on the part of the boy to "escape or to attract the notice of those about them." The dinner had been telegraphed for, and was duly awaiting them at the next grand station, where the faithful guard took care that everything should be served in due form. A very good dinner it was, and soon after the boy finished he began to grow drowsy and ended by falling asleep, from which he awoke to find himself in a roomy carriage with Annie-sie and a dignified matronly woman of about fifty, who strikingly resembled Annie-sie, save that where the hair of the younger woman was as of pure gold, that of the elder was as of shining silver. There were traces of care in her features, but she was very handsome and did not look her age. The conversation was carried on in a low

tone in German, so that had Ivan been awake there would have been no chance of his understanding much of what was being said.

"It is too dangerous," said the elder lady. "The risk is far greater in proportion than any amount of profit that might be got by the stratagem. It was a bold idea, and a very clever one, to destroy all traces of the child by his leaving Moscow as a girl. Under ordinary circumstances that would have been quite sufficient to lose him to his friends for ever, and to baffle the police effectually. But the boy's character should have been studied first before this was decided on."

"You see, aunt, we had no time to study his character. It was a sudden resolve on my father's part, and certainly the longer he is absent the greater will be the reward for his discovery. The police would have found him at the dreadful place which my father has chosen for his abode, unless we had kept him in the cellars, and that would have been dangerous. As it is I do not quite know what my father intends doing with the student who acted as this boy's tutor."

"Well, Annie-sie, I do not at all agree with your father in the wild political course he has taken up. It is the ruin of Russia that these dreadful secret societies have arisen; but that he should sacrifice position, rank, fortune, his family, everything, for such a dream, is what I never can understand; but I shall not forget how much I owe him on my husband's account, and shall always be ready to serve him where possible, and this is my plan."

"Speak gently," said Annie-sie; "do not awaken him—he is such a difficult charge for me; you see, I thought my influence over him was far greater than it is. I thought I could have wound him round my little finger—but no, he has a will of his own, notwithstanding his evident goodwill towards me."

"You see, my dear," said the aunt, smiling, "you have forgotten that he is a boy. Had he been twenty years older, then you might indeed have led him to death, or anything else."

Annie-sie blushed at this speech of her aunt's, and said,

"Nonsense, auntie. Poor little chap! I would not lead him to any harm whatever; and if I had not felt that he would have been safe with you, I never would have brought him hither. But tell me your plan."

"Well, child, I know you are very good at heart, and would not hurt a fly; therefore I am certain you will like my plan. By bringing him out of Moscow as a girl the police are thrown off the scent, and they will never recover it unless he has been recognised by those Gymnasium boys, which I do not think likely. He will be looked for all round Moscow, never having been seen to leave it. Now we have to throw off any suspicion of his being here. He will not play the girl long, so we must see that your promise about his dress is kept. But the coachman has seen him as a girl, which is fatal to his remaining as a boy. He must appear as a boy, but be got rid of as a girl. The latter feat must be accomplished first, and this is what must be done. You return at once to Moscow, and the household here must suppose that you take the girl with you. Your uncle goes,

with you, and alights at a little station called Volkova, taking Ivan with him. Here, in some out-of-the-way field, the boy gets rid of his female attire and appears as a boy, whom my husband takes to the monastery there, and introduces as his nephew. The Igumen is under very great obligation to my husband, and to his charge we will confide the boy. What do you think of the plan?"

"Nothing could be better, provided Ivan can be made to see the force of it. Of course I shall try to persuade him. A good night's rest is what he wants. He is quite a boy, and eats and sleeps and laughs just as nature guides him."

* * *

It was a splendid evening; just one of those lovely Russian nights that ought to inspire the whole nation with poesy. The sky perfectly cloudless, the moon and stars bright. The way led through forests and through cornfields, which had yielded up their tribute to man, leaving but the stubble to cover the ground. On approaching the house the visitor became aware that the owner differed in many respects from the ordinary Russian proprietor. There was a neatness, a system about the whole that told of German influence. The very dogs that came out and barked at the carriage were not so savage as those in Berozovo, Ozoonovo, and Zakolniki. But they woke up little Ivan all the same, who, forgetting or despising his costume, called out, "Hullo, zabaki!" (dogs) and began to whistle, at which the two ladies laughed merrily. He now roused himself more and more, and soon discovered that he was in a carriage and not in the railway coupée, and that there were two ladies with him.

"Annesie!" he exclaimed; "don't try to shuffle your promise about my things. I shall keep you to it, recollect."

"Never fear," she responded; "a German girl never breaks her word, but I must have some talk with you first. You had better hurry into my room with me and my aunt. To-morrow you will be a boy again."

"Hurrah!" shouted Ivan, much to the surprise of the coachman, who thought what a wonderful place Moscow must be for the education of young ladies. Fortunately Ivan committed no overt act, being too much absorbed in the contemplation of a charming little Skye-terrier which had got loose from the house, and had tried so hard to get into the carriage that the lady whom Annesie designated auntie stopped the horses and allowed him to join their party, much to the delight of Ivan, with whom the dog fraternised immediately.

The aunt, whom we shall call the Frau von Steinfeldt, was evidently pleased with the good understanding existing between boy and dog. She laid her hand kindly on Ivan's head as she said, "I am sorry to say that we shall not be long together. You will leave us again to-morrow, but before you go I should be glad of some chat with you in my own particular boudoir."

Ivan was rather impressed with the dignified bearing of this lady. He knew quite enough German to understand that the aristocratic prefix von (pronounced fon) before the name meant hereditary nobility, and he was the more puzzled how to connect all this with the wretchedness of the dwelling of Annesie's father in the Novoye Derayvnie. However, he said nothing, and only looked in

childish wonder at the stately but kindly lady who regarded him with such favour.

At last they drove up the avenue that led to the house, and the boy was still more astonished at the order and comfort that reigned supreme. Herr von Steinfeldt possessed a large manufactory, which brought him in a considerable revenue, with which he was always ready to assist the needs of others who had been less favoured by fortune. He was a Prussian by birth, and had served in the war against Austria in 1866. His wife, who was the sister of Annesie's mother, was of an old noble family of Prussia, haughty to her equals but kind to excess with inferiors, and as ready as her husband to help those requiring aid. She took a violent fancy to our hero, and had he not come in the guise of a girl she would have done much to serve him, but the impossibility of keeping up the disguise, and the difficulty of getting rid of it and reproducing him as a boy, determined her on sending him away to the monastery.

She therefore decided on having no fuss about reception, and told the servants that her niece and the young lady who accompanied her were going to leave again the very next day. A kind of closet opened from Annesie's chamber, in which a bed was made up for Ivan, who had great difficulty in getting rid of his detested disguise, but before he went to bed Frau von Steinfeldt explained her plan, which, to the dismay of both ladies, he flatly refused to adopt.

"Why should I?" said he. "I have done nothing; I am not afraid of the police. The truth is, I suspect you want to make Mr. Smirnoff pay money to the 'cannibal' for finding me, and I don't want him to have the money. If it would do Annesie Feodorovna any good, that would be another thing; but it would do her no good at all, it would only feed the cannibal and allow him to make fresh prisons and cellars. Now I have put on these horrid things to please Annesie. She promised that I should have my own when we got here; now here we are. Where are my clothes?"

"My dear boy," said Frau von Steinfeldt, "we are all anxious to serve you, but my husband would get into trouble with the police, which might be his ruin, if it were said either that a boy came here disguised as a girl, or that a girl came here who had never been seen before, and who disappeared to give place to an equally unknown boy! You know that we must report your arrival to the police, and send your passport to them, or we shall be greatly troubled. Where is your passport? What are we to do? Now if you go away before the time when it is necessary to send in your passport to the police, disappearing as a girl with my niece, then no one has a right to say a word about it. You then appear in your own character, and we write to the authorities that we have found you, and give you up to them."

"I see," said Ivan; "and then you pocket the reward, not the cannibal!"

"Whom does he mean by the cannibal?" said the Frau.

"My father," answered Annesie, quietly.

"Oh, indeed. What a sharp boy he is!"

"Now," exclaimed Ivan, "I will tell you what I will do. I will go back with Annesie to the first station, and then

your husband shall give me my own clothes directly. They must be made into a parcel and given to me there, so that I may feel safe. When I once have them on I do not so much care what happens. I don't think the cannibal's cellars would be so very dreadful as petticoats. Now I understand why people pity women so much! It is horrible. Fancy shinning up an oak-tree in things like these!"

As this was what was wanted, there was no difficulty now in striking the bargain. A good supper was served in the ladies' room, and assisted by the motherly care of the lady of the house, Ivan got to bed, and was soon sleeping the deep sleep of boyhood. When this result was brought about Frau von Steinfeldt said to Annesie,

"I do not think that it was very considerate in your father to drag us into his schemes and plots. The whole plan seems to me sordid and cruel. The good man who adopted this poor child is made wretched; the welfare of the child is utterly disregarded; and no other consideration seems to influence your father than to sacrifice whatever is good and noble for these fanatical politics! I am really indignant when I think of the utter want of principle he shows!"

"But, my dear aunt, you must remember that he is my father, and has been a kind father to me."

"Kind father, indeed!" exclaimed the aunt, who was about to follow up this exclamation with some remarks on the wretched mode of life to which Annesie had been subjected, but her better nature prevailed, and she only said, "Right, my *duschinka!* [darling]; never forget that he is your father. Honour and love him, and you have the promise which certainly will not fail. You are a good girl."

A loving kiss was the appropriate reply to this praise. Frau von Steinfeldt left Annesie for the night, and went to meet her husband, who had just come in from the factory, where he had been detained over some complicated accounts.

"Well, Marie," said Steinfeldt, "how is Annesie? Curious telegram that was. What does Hermann want with us? Remember, I am not going to be mixed up with any of his harebrain plots. I suppose he wants money? How much?"

"He does not want money," said his wife, who then proceeded to relate the story of Ivan, and how she proposed he should be got rid of.

Steinfeldt walked up and down the room in an uneasy frame of mind. At last he said, "It is altogether unfortunate. The feeling throughout Russia against the Germans is becoming stronger every day, and is greatly nourished by the police. I have studiously kept myself out of all political matters, and here is just the possibility—or rather the strong probability—of my being dragged into a most unpleasant affair."

"Well," replied the wife, "it has not been my fault. The telegram announced the arrival of my sister's child, accompanied by a poor orphan, for whom she desired aid. I had no time to reply and say that I would neither receive my sister's daughter nor help the orphan; and if I had had ever so much time to think over it I should be the last to refuse to listen to such claims."

"That's all right enough! I don't blame you in the least, only what are we to do?"

"Let him apparently return with Anniesie, and then leave at the nearest station in your company. Let him change his dress, and then you take him to the monastery. He is a Russian, and they will be glad to secure him for their own service."

After much deliberation this plan was agreed on, and the next morning, after breakfast, the carriage bore off Anniesie on her return journey, accompanied by Herr von Steinfeldt and Ivan. Arrived at the station, Steinfeldt took tickets for Anniesie, himself, and Ivan, the two latter being only as far as the station Volkhova, not far from which was the celebrated monastery of Kupsk.

The train started, and everything seemed to promise well. Ivan was quiet. They had given him his bundle of clothes, which he held fast with both hands, and, to the surprise of all, never spoke.

Soon Steinfeldt and Ivan were walking along the path leading to the monastery. It was a hot day, for the reader must remember that we have gone back in point of time to take up the thread of our story. The increased rewards had not yet been offered for the discovery of Ivan, although the police were actively engaged in the search.

The path led Ivan and his new guide through one of the dense forests which form so important a feature in the scenery of this part of Russia. The one in ques-

tion was not of large extent, and a brisk walk of half an hour sufficed to bring them through that portion of it which they had to traverse. On emerging from the wood a broad, clear sheet of water spread before them an inviting surface.

"Now," said Steinfeldt, "strip, and jump in."

But this was more easily said than done, for before the hated vestments could be removed Steinfeldt's pocket-knife was often in requisition to cut strings, laces, etc., which to the boy had become objects of intense disgust. At last he was free, and waving his arms aloft in irrepressible glee, he gave vent to a wild hurrah of delight, and dashed headlong into the water.

Steinfeldt opened the parcel containing the boy's clothes, and arranged them in order on the grass. Then he made the female dress up into a parcel of similar form to that which they had carried with them. He took the precaution of enclosing a heavy stone in the parcel, which was well secured with plenty of string.

He now called Ivan to him, and giving him the parcel, bade him swim with it to the very centre of the pond and sink it there. If ever boy obeyed a command willingly it was Ivan when obeying this order of his new-found friend. He had some difficulty in carrying the bundle so far on account of its weight. Being a

first-rate swimmer, however, he mastered this difficulty by taking a loose end of the string between his teeth, and getting the parcel itself on his back. When he reached the centre he heard the voice of Steinfeldt calling from the brink, "Enough! Drop it!" Instantly the parcel was dropped, and sank to the bottom noiselessly.

Steinfeldt could not forbear laughing. "What a thorough boy you are!" he said when the toilet was complete.

"The saints be praised for that!" said Ivan. "I was getting girlish enough in those things, and I am not sure that I ever shall be quite the boy again that I used to be."

"Never fear. You are all right," said Steinfeldt, "as thorough a little man as I should wish to see. But, look here, never say a word about this adventure of the girl's dress to any one."

"Who? I? Well, that's a queer thing for you to tell me. Do you think I am likely to speak of such a disgrace? Not I!"

The path led them on through the same kind of scenery that we have so often described, until the celebrated monastery of Kupsk was reached. But so important a place deserves a chapter to itself, and we have other personages in this strange story to look after. So we must take leave of Ivan for the present.

(To be continued.)

A BEAR STORY.

HUDSON'S BAY is not, perhaps, the pleasantest of places in the depth of winter. That is, however, the time when it presents most attractions to those who visit it, for the cold drives the animals from their hiding-places, and the difficulty of finding anything to eat makes them bold in the pursuit of food, even to the extent of snatching it from the jaws of a trap.

A small party of trappers were seated round a camp-fire one night a few years ago. They had a blaze big enough to attract all the animals of the forest, for it was bitterly cold and fuel cost nothing.

"I saw bear tracks to-day," remarked Coppée, a French Canadian. "I shall hunt him to-morrow."

"You're always seeing tracks," said Martin, a burly Englishman, "but you never seem to come up with the bear. Foxes are more in your line."

Coppée looked as if he would like to have retorted with more than words. But he was a good-natured little fellow, and could make allowance for Martin's want of amiability.

"I shall try and find this one," was his reply. His eye twinkled with joyful anticipation, for he had discovered the home of the bear, a discovery which he meant to keep secret.

"You can't go to-morrow, Coppée," put in Hopkins, a Yankee. "You're to go to the cache; the agent will be along soon."

"Ah, so I have," exclaimed Coppée, dolorously. "Never mind, my bear will keep for a day or two."

"Where's his hole?" inquired Martin, carelessly.

"Ah, wouldn't you like to know?" was Coppée's evasive reply. "No, my friend, I mean to pay my morning call by myself."

"That bear will live a lonely life then, that's all I can say," retorted Martin, rising to throw more pine knots on the fire.

"We shall see," said Coppée, "only don't expect a paw all to yourself when I bring the skin home."

"I'll eat the skin when you bring it," responded Martin, laughing.

Coppée made no reply, but his face showed the determination to carry out his intention of killing Bruin. Soon after all the trappers rolled themselves in their blankets and dropped off to sleep.

They woke early; the fire still smouldered. They made a hunter's breakfast, and each prepared to go his own direction.

"Where are you off, Martin?" asked Hopkins.

"Up by the ravine. I shall be back early to-day. Look out for that bear, Coppée."

"I shall not call on him to-day; I'm off for the cache."

"Well, it's all the same for the bear," was Martin's remark, as he shouldered his gun and lance and strode off.

Coppée gave one of his light-hearted laughs and started in the opposite direction.

"He is angry that he did not find the tracks himself," he thought. "Poor Martin! he has had bad luck this season. So have I, though, till now; but when I've shot this bear I shan't be able to complain."

He walked rapidly along, for he had a long journey before him. The "cache" he was about to visit was a hole beside a tree, carefully boarded up and covered over. In this were hidden the skins of the animals they captured. At stated times the Company's agent came round and took them away. One of his visits was nearly due, and Coppée had to make a preliminary inspection of the cache.

He was about four miles from the camp, swinging along with a hunter's stride, when he stopped as if he had been shot.

A minute after he was retracing his steps at a long trot. An unwelcome thought had struck him.

Martin had said that he was going to the ravine. Coppée knew that "the ravine" meant a certain gorge between some rocky hills, a part of the district which Martin rarely visited. It was to this very ravine

that he had tracked the bear on the previous day.

By this time it was quite possible Martin had come across the tracks, and, forsaking his guns and traps, had set off to trace where they led. If so, he would never rest content till he had killed the bear. And that bear fairly belonged to him, Coppée.

That would never do. How could he endure the chaff of the camp after his tirade of the previous evening? No; he was resolved that come what might he would be first on the spot, and not leave to Martin the chance of killing the largest bear he had seen signs of during the whole season.

So the little Frenchman ploughed his way along, taking a short cut through the woods. What was it made him pause for a moment and then redouble his pace?

It was this. He remembered suddenly that all the tracks leading to the bear's cave were on the side of the ravine farthest from the camp. He had come across them on his way home; but Martin, entering the ravine from the other end, would see nothing to raise his suspicions till he reached the cave. The bear would have scented him long before, and the terrible fear which crossed Coppée's mind was that Martin would be attacked unawares. Such an unequal contest could have but one result.

Coppée forgot all about his own desire to kill the bear; his one hope now was that Martin might have succeeded in doing so. Never had he run so fast in his life. He pelted over the snow, choosing where possible the ground sheltered from the drift.

It seemed an age before the ravine was reached. He leapt from rock to rock with more agility than prudence. One more turn and he would be in sight of the cave.

He was at the very corner when a terrible cry reached his ears. He leapt forward to see his worst fears realised. An enormous bear had rushed on Martin, who had not even time to fire; his weapon was dashed from his hand, and he was thrown violently to the ground.

"He took a hasty aim, and fired."

Coppée raised a shout, hoping to turn the beast's attention. His idea bore fruit—the bear turned in his direction for a moment, giving Martin time to draw his long hunter's knife, but, before he could use it, the bear, with an angry growl, sprang on him again.

Another moment and it would have been all over, for the animal's enormous weight prevented Martin from even turning. But Coppée had made the most of the few seconds and was now but half a dozen yards off. He took a hasty aim, all trembling as he was with his tremendous exertions; the ball hit the bear under the shoulder. With a fearful

growl he sprang off Martin's body and began biting the wounded part.

Now came Martin's turn. With a temerity born of a hunter's life he raised himself on his hand and plunged his knife into the body of his foe. It found his heart.

Martin rose to his feet and for the first time saw Coppée.

"I killed that bear," he said.

Coppée looked at him in astonishment for a moment and then burst into one of his merry laughs.

"You are right," he said; "you killed the bear. I came too late."

"No you didn't," replied Martin; "you came at just about the nick of time. If it hadn't been for your shot it would have been a case of 'killed by a bear' for my grave-stone. I'll do as much for you if ever I get the chance."

Coppée saw that he had conquered his rival's enmity for ever. When in the evening they were once more seated round the camp-fire, Martin told the story of his rescue, and told it in terms which showed he felt deeply Coppée's conduct. However, none the less could he resist ending his story with "But I killed that bear after all!"

STRING-CUTTING.

THERE are probably some hundreds among our readers who have cut their fingers severely in the endeavour to break a piece of twine in the way they have fancied they saw the shopman do it when he tied up their parcel; and of these it is likely a large percentage are still living in ignorance of "how it was done." A peculiar twist of the hand and all is over! With the shopman the string breaks; with the customer it gives his fingers such a nip that he does not care to repeat the experiment!

As the successful method is not without its lesson we give it herewith. In the lower figure, that of the open hand, the string is wound round the fingers in the proper style, and in the centre of the palm is shown the Y, which bears such an important part in the arrangement. Further description is unnecessary. The Y is kept stretched, the hand is shut as in the cut in the top corner, and then the hands are smartly drawn apart, and that with the string on is opened and the string breaks before the shock has time to travel to the hands. String-cutting is in fact an interesting demonstration of the principle of inertia.

The most delicate hands will be uninjured in this exercise, providing the string is arranged properly and the blow sharply given, and string of great strength can be snapped with ease. But should the cord be wrongly arranged or the blow feebly struck, even the finest string will be obstinate and the toughest hand may be hurt. It is as well,

however, to begin experimenting with a fine string, as there is just a possibility that you have not quite got the arrangement you intended. It is a curious fact that at first the

string will seem to have broken in the wrong place, but on measuring it you will find that the cut has taken place at the Y as it was designed to do.

THE BUTTERFLY TOP.

IN our first volume we gave a description of a flying top in which a piece of card shaped like ship's screw was thrown off into the air from a spindle consisting of an old cotton reel working on a penholder. This curious contrivance was found to work very well, and many of our readers succeeded in keeping the aerial machine afloat for some seconds after each spin. The card screw was merely a substitute for the silk fans stretched over cap-wire that used to do duty in the aerial tops which were common on the toystalls of the Crystal Palace in its more prosperous days, and which were frequently to be seen flying about the galleries and returning to the senders like so many boomerangs.

These tops, or rather machines on their principle, had been invented as long ago as 1784 by Lannoy and Bienvenu, and had been presented as noteworthy inventions to the French Academy of Sciences. The difference between the "helicoptera" and the top consisted only in the one being spun with string wound round the spindle, and the other bearing its motive power aloft with it in the shape of a piece of whalebone acting as a spring.

The distances traversed by this long-named invention were very trifling. The whalebone

soon shot out straight and the tiny spindle was soon unwound. Nevertheless, it took three-quarters of a century to improve on the poor little helicoptera!

Penard took the contrivance in hand, and for the spindle and whalebone substituted the india-rubber ring as shown in the cut. In order to give the affair some excuse for its name he fitted on the lepidopterous-looking wings, which offer a certain amount of resistance to its tendency to twist. The essential point of the apparatus is the screw at the top, consisting of two pieces of light cane such as are easily got out of a Japanese umbrella, and the silk or paper diaphragms pasted on to them. Two strips of wood with a cap at each end, one with a fixed hook and the other with a revolving hook coming through the top from the centre of the fans, form the rest of the little flying-machine; and if the india-rubber ring down the centre be well wound up, the force obtained from it will be sufficient to send the toy skimming along for ten or a dozen feet overhead.

Several aeronautical machines have been made on this principle. One of them, Forlanini's, had a small steam-engine in place of the spring. This steam-engine, with boiler

fitted complete, weighed about six pounds, and developed a quarter-horse power. It rose in the air and behaved well, but was on too small a scale to support anything but its own weight.

The difficulty in working upwards with screws is due in a great measure to the wind. In a perfectly still atmosphere the fans get a fair chance, but in a breeze they should be slanted to a certain angle to get their full power, and the regulation of this angle is anything but an easy problem for the sanguine inventor.

For many years Tatin has been experimenting with fans as elevators, and has produced several dozen "flying-birds" of all dimensions. Some of these have weighed a couple of pounds or more, while others have not turned the scale at half an ounce. Some have been a couple of inches across, while others have measured a couple of yards from wing-tip to wing-tip. But nothing of practical use has as yet resulted from his efforts. As he himself admits, he may have been on the wrong tack altogether. "Our grandfathers did not build the locomotive in the shape of the hare and the antelope, although they emulated the speed of those animals,"

and the air-ship of the future need not necessarily be of birdlike form.

Meanwhile the "helicoptera" has found

its way into the toyshops, and "butterfly-tops" are selling by dozens at sixpence apiece.

AERIAL RINGS.

A FEW very pretty experiments can be made with smoke rings, and as the apparatus is cheap and easily procurable it may be worth while to say a few words about them. The best arrangement for producing satisfactory results is that shown in Fig. 1, where a glass jar with a tap at the base is resting on a stand. Into the jar and through

the cork a small tube is fixed and the whole sealed down, so that all air passing into the jar must come through the tube. The finer the tube the better; the material is of no consequence—it may be of metal, glass, or clay—so long as the passage down it is kept clear. To it, as shown in the cut, a holder is fixed, to which the candle or what not is attached, so that the centre of the tube points fairly into the smoke. The jar is filled with water, the cork fixed down tightly, and the candle

lighted. The tap is then turned, and as the water runs out it sucks down the smoke, and the rings will be seen rising through the water and forming on its surface, as shown in Fig. 2. These rings will soon disappear and gradually merge into a sort of collar, shown

in Fig. 3, where the central bar is the tube leading up to the source of smoke.

There are other ways of producing smoke rings. For instance, rings such as shown in Fig. 4 are produced during the combustion of phosphoreted hydrogen, the white vapours of the phosphoric acid rolling up into the air in apparently whirling crowns. From guns and field-pieces the smoke often emerges in rings, and steam out of a small vertical jet is often

shot forth in small circles, such as shown in Fig. 5.

There is, however, a far simpler way of making smoke rings than any we have described, and that is by procuring a cubical cardboard box with a small round opening in two of its opposite faces, filling it with smoke from burning brown paper, and sending the ring

into the air by hitting the palm of the hand against one hole so as to eject the smoke wreath at the other. In this way most excellent rings are formed, and if received on a

piece of damp glass the rings can be caught and held for a few moments for examination. In a quiet room free from draughts the regularity and duration of the rings will provide a surprise for those who have not tried the experiment.

Correspondence.

CANADIAN.—The distance from Liverpool to Cape Race is 1,977 miles; to Portland, 2,773 miles; the distance from Queenstown to St. John's is 1,734 miles. A modern ocean steamer consumes about one ton of coal for every knot she runs.

With the Compliments

APPLE BLOSSOM.—The large plate of British Birds was in the June part for 1882; that of the Birds' Eggs was in the second volume. The articles on dogs were in the second volume.

W. J. WHITE.—J. M. W. Turner was born on April 23, 1775. He was elected an Associate of the Academy in 1799, and a full R.A. in 1802. Perhaps "The Fighting Téméraire" in the National Gallery—but read Ruskin.

COLLECTOR.—1. To retire a bill of exchange is to withdraw it from circulation by buying it up. 2. To protest a bill of exchange is to give formal notice of non-payment on presentation; it is generally done only by a notary and in case of foreign bills. The mere process of noting is a sufficient protest for inland bills. 3. Co-optate is a long-winded word, meaning "to choose." The governor need not act unless he likes. 4. There are many excellent books on banking by H. D. Macleod, J. W. Gihart, W. Bagehot, Thomson, Hankey, and others. For list apply to Effingham Wilson, Royal Exchange. You would find Warne's "Commercial Handbook," published by Warne, of great service to you. It costs five shillings.

DUOBUS.—Mix some vegetable-black with gold-size until the mixture is of cream-like consistency. With it "ebonise" your egg cabinet. Rest the eggs on wool, and use naphthalin to drive away the insects.

W. B.—The first egg is probably that of a chaffinch. The second, with the ring of spots, seems to be that of a red-backed shrike.

AN ARAUCANIAN (Valparaiso).—Yours is by no means the first letter we have had from Chili. Write for a catalogue to the firm you think of purchasing from, and then order your goods, enclosing remittance. The positive and negative elements of the battery must somehow have been in contact. The moisture of the air would act sufficiently on the acids. You should have cleaned it chemically—not mechanically.

OLD NEW ZEALANDER.—Many thanks for the copy of the "Nelsonian." It is one of the best school magazines published in the colonies that we have had the pleasure of seeing.

J. G. FENN.—1. Quite so. 2. To polish steel use a spongy piece of wood saturated with sweet-oil, and lightly dusted with powdered emery. This will not only clean off all rust, but will give a polish at the same time. You can get a burnisher that might be of some use to you from a bicycle shop.

WOULD-BE INVENTOR.—Consult the free library at the Patent Office in Southampton Buildings, Chancery Lane. You will there find a classified index of all inventions, and can read the specifications yourself to discover if your idea has been anticipated.

A WELL-WISHER.—The headquarters of the Cyclists' Touring Club are at 56, Fleet Street. Apply by letter to the secretary for full particulars.

HEADER.—The best book on swimming costs six shillings. It is published at 56, Paternoster Row, and its title is, "Boy's Own Annual," Vol. 1.

JOHN and NORMAN (Montreal).—1. It is a *nom de plume*. 2. Mr. Ballantyne has travelled extensively, and visited the countries he describes. 3. We had sent to us the special supplements of the Canadian papers describing the winter carnival, the ice palace, etc.

C. H. BERTHOX.—You will find instructions in making silk balloons in the March and April parts for 1882. The articles were called "Balloons, and all about them."

F. R. C. S.—The cost of your education and hospital course would be about £300. Eighteen is about the right age to take up special studies, if you are previously well grounded in generals.

T. M. B.—A railway engine, unloaded, weighs on an average forty tons; a truck, unloaded, about a ton and a half.

SPIDER.—1. The words "Entered at Stationers' Hall" mean that the steps for protection of copyright have been duly taken. 2. Instant and current mean this month, ultimo last month, proximo next month. The words are occasionally abbreviated into inst., curr., ult., and prox. 3. Tare is the weight of the carriage or package, tret the weight of the goods. A coal truck with 1. 5. 0. tare weighs, when loaded, 11 tons 5 cwt.

R. N.—The master is not mentioned in the articles on the Navy for the very sufficient reason that he does not exist. The rank has been abolished for some years. The master's place is taken by the navigating lieutenant, and the particulars of entrance, etc., were given in the "Life on the Ocean Wave," in the second volume, to which you allude, but which you do not seem to have read.

W. E. P.—All animals breathe. Fish breathe the air contained in the water. The remembrance of the existence of the air-bladder would have solved one of your difficulties.

AMBITION.—You will find a great deal of information as to schools and scholarships in Cassell's Educational Year Book. It will probably be obtainable at the free library.

EDGAR.—You had far better leave your ears alone. The efficacy of the piercing as a cure for anything is merely a vulgar superstition. Earrings are but relics of barbarism. Why not wear a ring through your nose? Would you not find the counter irritation so set up an excellent remedy for baldness?

How it began,

J. EWART LITTLE.—1. In continuation of our hints to apprentices in our number for May 24th last, we now beg to add another useful detail for them to remember, and that is that a penny stamp will not pay for twopence out of pocket. Another point, perhaps, worthy of mention is that the Post Office authorities are thoroughly acquainted with the values of the stamps on issue. 2. You can get a list of Danish books from Messrs. Trübner, Ludgate Hill; or Messrs. Sampson Low and Co., Fleet Street. 3. A left-handed man will never become a right-handed one, unless disabled for a time.

P. A. SMITH.—1. The decision as to a no-ball rests with the umpire. If he cannot decide the ball must be considered all right. 2. When the wicket is bowled down the umpire has nothing to say. The man is so obviously out that an appeal is unnecessary.

PASTER.—The number of pieces of English paper-hangings required for a room is easily found by measuring all the lengths of the four walls, multiplying their sum by the height, and dividing by 63.

and ended!

of the Season!

H. J. BAGNALL.—A legal question. A river, however, is free for as far as it can be navigated by barges and has got a towing-path, but beyond that there are many exceptions.

RABBITS.—The first articles on Rabbits were in the first volume. Since the third volume we have treated the subject every month.

A YOUNG NATURALIST.—See the "Boy's Own Museum" articles in the third volume, and those on Waterton's method in the fifth volume.

FILIS.—Try Newman's "British Ferns," price two shillings, published by Van Voorst, Paternoster Row.

JACK TAR and Others.—The training-ships for fore-castle hands are the *Clio* at Bangor, the *Gibraltar* at Belfast, the *Formidable* at Portishead, the *Havannah* at Cardiff, the *Mars* at Dundee, the *Cumberland* at Glasgow, the *Southampton* at Hull, the *Akbar*, *Clarence*, and *Indefatigable* at Liverpool, the *Arethusa*, *Chichester*, *Warspite*, *Cornwall*, *Exmouth*, and *Shafesbury* on the Thames, the *Mount Edgumbe* at Plymouth, and the *Wesley* at North Shields. Of these the *Akbar*, *Clarence*, and *Cornwall* are reformatory ships. For admission or information the best plan is to write direct to the captain. The training-ships for officers are the *Conway* at Liverpool, and the *Worcester* at Greenhithe. The fees for the first average £50 per year, those for the second £60.

PUER.—Unless we read the story we cannot say, and unless it is written on one side of the paper only we will not read it. Under the circumstances we think it better to decline. Why you should take the trouble to put yourself entirely beyond hope is to us inexplicable. A moment's thought would show you that, written on both sides of the paper, the copy becomes very troublesome if not useless for printers.

J. J. L. STUART.—1. The author of "Ingoldsby" was the Rev. R. H. Barham. 2. If you put your helm to port the rudder turns to starboard, and the vessel's bow turns from port, for the reasons already given at length in these columns. 3. We can do nothing with a story that will take up two weekly numbers, as our arrangements are made. Any ms. you send will be considered, and returned if unsuitable.

R. I. C.—The shallows on the river would render a catamaran useless for your purpose. No matter how you built it, it would necessarily draw more than two inches of water. Perhaps a large light canoe of the Rob Roy type would suit, or a boat built after the model of a Norway pram.

W. B. B.—It would be unreasonable to camp out on a certain piece of land for a fortnight without having first obtained the proprietor's permission, and offered him or his representative a trifle as nominal rent.

R. S.—The paper you mention is not a medical one. The "medicals" are "Lancet," "British Medical Journal," "Medical Gazette," "Medical Times," etc. The name of the paper and "London" is a sufficient address for a leading newspaper.

LENS.—To polish glass try putty powder—and patience.

AN INDIAN LAD.—1. Four thousand pounds. 2. The usual pronunciation is Clark, and your fellow-townsmen are therefore right. 3. Colour will make little difference to you in the world; feature and expression may.

MUSICAL.—The liquid is sugar-and-water, or gum, or anything sticky. The fingers sticking to the glass cause the vibration. Try an experiment with a bottle cork.

ADAMANT.—You are liable to an action for damages. The law against trespass is obscure, and the result so problematical, that proceedings under it against pedestrians are but rarely taken—hence the notion that it does not exist in your district.

No. 314.—Vol. VII.

SATURDAY, JANUARY 17, 1885.

Price One Penny.

ABBING'S LITTLE JOKE.

BY ASCOTT R. HOPE,

Author of "The Amateur Dominic," "The Telltale," etc.

CHAPTER I.

IT was a wet half-holiday afternoon, and the boarders of that Whitminster school about which I have already written so many stories were pent up indoors, making the best of it with more or less resignation. A swarm of noisy urchins filled the schoolroom and the dining-hall, some playing at such games as were practicable, others letting off their spirits by mere whooping and

A joke indeed!

chasing, a few trying to devote themselves to quieter pursuits under difficulties, and one at least yawning and fidgeting in want of some mischief for his "idle hands to do." Since he could think of nothing else, Master Abbing had just hit upon the idea of going to tease a fellow called Phillips, who sat aside from the babel peaceably reading a book, when a small boy came up to the latter with a message from the matron of the school house.

"Phillips, Mrs. Bramble told me to remind you that it is your day for taking a bath."

"I know," replied Phillips, without raising his eyes from his book.

"And you are to be sure and do it before you go out to your uncle's."

"All right."

"And your new clothes have come."

"Have they?" said Phillips, looking up with interest.

"Yes; but you are not to put them on till you are ready to go out."

"Oh, ain't I?" said Phillips, sniffing a little at this order of maternal government.

"For fear of making a mess of them," continued the small boy, faithfully performing his errand. "So she has put them in the bath-room, and you can change when you go up there."

"Very well; there's no hurry for half an hour or so," quoth Phillips, betaking himself again to his book.

Now Abbing had overheard this conversation, and it suggested to him a trick quite after his mind. Phillips, as a harmless and by no means formidable fellow, was always a favourite butt of his somewhat ill-conditioned humour. Moreover, he felt unconsciously jealous of the other's luck in being asked out to dine in town with his uncle, whereas nobody had given Abbing any such chance of enjoying himself. Then Phillips set up for being a little bit of a dandy—a taste naturally resented by untidy young slovens like Abbing. For one of these reasons, or out of pure love of mischief, he thought of going up to the bath-room, slipping on Phillips's new clothes, running out into the muddy playground long enough to "take the shine out of them," and thus raising a laugh among scapegraces of his own kidney, whose notion of the choicest wit consisted in befooling or annoying some one—the fun, of course, seeming all the finer when their victim was likely to lose his temper without having any means of redress.

With a zeal that in some better cause would have been commendable, as the copybooks say, Abbing set about this business at once, not letting any one into the joke for the present till he made sure of being able to carry it out. It was strictly forbidden to go upstairs by daytime without special permission, so he had to run a certain risk of being caught by the authorities. To lessen this risk, he removed his boots at the end of the passage, hid them away below the staircase, then cautiously slipped up to the second storey in his socks, and, stealing past a row of empty dormitories, came undetected to that bath-room which he knew to be the one for Phillips to use.

There he found the clothes lying over a chair, glossy and spotless, just as they had come out of the tailor's parcel, with a clean shirt and collar brought forth from Mrs. Bramble's stores, as becomed for the boy who was to dine with his

uncle. Chuckling at the thought of Phillips's vexation by-and-bye, Abbing quickly undressed to array himself in this finery. Having taken off everything but his socks, he had already begun to finger the new suit when he heard a heavy tread in the passage, and at the same time a familiar sound of some one clearing his throat that might well make the trespasser start in sudden alarm. It was their strict master, who had such a way of *hawking* in his throat, a peculiarity for which naughty boys had often cause to be thankful, comparing it to the warning given by the rattlesnake before its deadly spring, for thus this disciplinarian would often announce his approach at times when it might otherwise have proved highly inconvenient. And now who but he, at this time of all others, happened to be passing through that part of the premises!

Abbing was in a great flurry, for though finding it very funny to hurt other people's feelings, nobody could be less fond than he of being hurt himself—indeed, he was a good deal of a coward, like many other tricksters. He had left the door of the bath-room ajar, and now he durst not shut it for fear of attracting suspicion. What he could do was to dart back into the corner, squeezing himself up behind the door, when, to his horror! the master pushed it open and just looked in as he passed to see why this room was not locked up according to rule. All he saw was two suits of clothes lying in a heap on the chair, and Abbing remained hid at the back of the door, which so conveniently for him opened inwards.

"Tut, tut!" exclaimed the master. "How untidy these boys are! Mrs. Bramble should not allow them to leave their things lying about in this careless fashion. I must speak to her about it."

Then, to the dismay of his unseen hearer, he gathered up all the clothes and walked off with them, after shutting the door upon Abbing, who could not find courage to make known how he was thus left destitute of everything but a pair of cotton socks. Here was an accident upon which he had not reckoned! How was he to come by his clothes again without betraying himself to punishment for having broken rules? How was he to get away from this forbidden place without exhibiting himself in his naked plight? And how was he to end the whole business without drawing upon himself worse than the ridicule that he had designed against another? for he knew well that, even if he could escape the master's tender mercies, his school-fellows would never let him hear the end of such a good joke.

This was a nice trap, indeed, in which he had been caught so neatly. Mrs. Bramble kept the boys' clothes under lock and key; there could be no getting at any of his except by reclaiming that suit from the pound in which the master would place them, a dangerous adventure even for one equipped from head to foot with decent garments and the consciousness of innocence. His best hope must be that Phillips would soon come up and help him to a better condition for appearing in public. Abbing was not the fellow to be readily ashamed of himself, but let us trust he felt a little shame at looking for deliverance to the very person against whom he had been

scheming mischief. But Phillips, all taken up with that stupid book of his, might be a long time in coming, reflected Abbing, ruefully, even though he could not help being a little tickled by the ludicrous side of his own misfortune. Meanwhile, to drown care and pass the time, he thought he might as well have a bath himself since he had the chance.

So he turned on the hot water and was soon splashing and ducking, when there came another footstep to scare him, the matron's this time. His first thought was that the master, having taken his clothes to her as wardrobe waifs and strays, she had come to look into the matter. But her first words, after she had knocked on the door to summon attention, showed that he was mistaken for the legitimate occupant of the bath-room.

"Are you in there?" cried Mrs. Bramble.

"Yes," replied Abbing, making a great splash in the bath the better to disguise his voice.

"Some one has brought your new things back to my room!" screamed the good lady at the pitch of her voice. "I will put them in your bedroom; you can dress there."

"All right," mumbled Abbing, thinking to himself that it was all wrong, but unable on the spur of the moment to find any utterance more to the purpose.

Mrs. Bramble trotted off, presently returning to give another loud knock, and cry out,

"You must not waste any more hot water! I'm going to have it turned off at the boiler; do you hear that?"

Abbing heard, and shivered. Already he found that a hot bath is not in the end the best way of warming oneself, especially if one has no clothes to put on afterwards. Now his head and shoulders felt as chilly as a cod's, and the water would go on growing colder and colder as he sat soaking with his knees drawn up to his chin, meditating in the bath like Archimedes, but wholly unable to cry out with that philosopher, "Eureka!" The more he thought over it the less chance he saw of coming off scot free from this awkward situation.

"That fool, Phillips!" he murmured, crossly, as if it were anybody's fault but his own that he sat there a chapfallen practical joker.

Anyhow, he could not stay all day in the bath. As he was drying himself a resource occurred to him. There were several towels in the room more or less damp and dirty. These Abbing knotted together and made an improvised toga of them, in which he wrapped himself up. Thus arrayed somewhat after the fashion of a ghost walking in broad daylight, a ghost too in need of his next washing day, he ventured out into the passage, not quite knowing what to do next.

He guessed where his own clothes would probably be if he could only get at them. They were no doubt lying downstairs in the matron's room, a general hospital for strayed and dilapidated garments, where she would presently find them and want to know how they came there. Phillips's new suit had been taken to his bedroom on the same floor but at the other side of the house. Abbing judged it the safer course to make a dash for them, but he had not gone half way when he became conscious of a lion in the path, to wit, Mrs. Bramble, who was putting by some

linen in a cupboard that he must pass. He had just time to slink round a corner out of her sight.

There was nothing for it but to steal back on his bare feet to the head of the stairs. If he could only gain the hall unperceived and possess himself at least of his great-coat! As he halted, trying to calculate the chances of this enterprise, he heard the master's voice below, and that made him draw back, ready for an immediate bolt into the bath-room or some other place of hiding. So he stood between Scylla and Charybdis, uncertain whether to risk the frying-pan or the fire, trembling with cold in his panoply of damp towels, and wishing with all his heart that he had hit upon some other amusement for a wet afternoon.

Oh, for his clothes! and now that he came to think of it, there were some things in the pockets of them that would not bear examination: a catapult for

shooting stones, an engine strictly forbidden at the school house; a book scribbled over with caricatures of the masters and of the matron herself, perhaps other contraband articles certain to bring him into trouble if Mrs. Bramble took the opportunity of overhauling those well-stuffed pockets. A pretty mess he had made of it altogether with his little joke!

At last! Was that not Phillips's step upon the stairs below? But how long he was in coming, reading a book, of course, and stopping on every step! Abbing ran down one flight of stairs to meet him, then was just about to venture a loud whisper by way of hurrying him up. Luckily he first took the precaution of poking his head over the bannister, and to his consternation saw that it was not Phillips but Mrs. Bramble toiling slowly upstairs under a load of clean shirts to be put out for next morning's

wear. She must have gone down by the other staircase.

Abbing once more took to flight, scuttling along the passage of this storey in search of a hiding-place. He popped into a dark cupboard that stood invitingly open, and, gently closing the door, stood quiet as a hunted hare till the matron had gone past.

He now felt so miserably cold that he was glad to find the floor of this place littered with a great heap of dirty linen, sheets and such litter collected there for the wash. He lay down among them, wrapping his whole body up thickly, a most agreeable change from that damp and airy costume of towels. In a few minutes he found himself so warm and comfortable that he ended by falling fast asleep before he had quite settled how long he should remain in this snug nest.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XIV.—THE NORTH OF THE LIMPOPO.

THREE days elapsed before a ford could be found across the Limpopo. Even then it probably would not have been discovered had not some Macalacca Kaffirs undertaken to act as guides.

These Kaffirs are the subject race held in slavery by the Bechuanas as the Helots were by the Spartans of old—made to work without pay, treated with great severity, and, worse than all, forbidden to eat any flesh. The unhappy Macalaccas can kill as many birds as they please, but only on condition that they hand them over to their masters.

A Macalacca possesses nothing of his own, not even a hut or a calabash. Lean and half starved, he goes about nearly naked, with a bandolier over his shoulders, serving him for a water-bottle, made of buffalo intestines, and looking at a distance like yards of black pudding.

Bardik's commercial genius was soon displayed in the consummate art with which he extracted from these savages the avowal that, in spite of their misery, they were the owners of sundry ostrich plumes, hidden away in a neighbouring thicket. He immediately proposed to buy them, and an appointment was made for the bargain to be completed in the evening.

"You have some money with you, then, to give them in exchange?" asked Cyprien, much surprised.

And Bardik, with a broad grin, showed him a handful of brass buttons which had taken him a month or so to collect.

"That is not proper money," said Cyprien, "and I cannot allow you to pay these poor people with a few old buttons."

But he found it impossible to make Bardik understand in what way his idea was reprehensible.

"If the Macalaccas accept my buttons in exchange for their feathers, what is there to find fault with?" he answered. "You know that the plumes have cost them nothing to collect—they have not

even a right to keep them, and can only show them to us on the sly. But a button is something useful, more useful than an ostrich feather. Why, then, do you stop

Fording the Limpopo.

me from offering a dozen for a dozen plumes?"

The reasoning was specious, but worthless. What the Kaffir did not see was that the Macalaccas took the brass but-

A tall black, wearing an old red cotton mantle and the usual diadem of sheep-gut of the Kaffir warriors, stalked out of the thicket where the bargaining was going on, and with his spear struck away right

"Without a thought as to what he was doing."

tons, not for the use they would make of them, but for the supposed value they attributed to the metal disks which resembled coins so much in shape. And therein lay the wrong.

Cyprien, however, saw that the distinction was too refined to be grasped by the intelligence of the savage, and so he had to leave him to act as he pleased.

In the evening, by torchlight, Bardik's bartering was resumed. The Macalaccas were evidently afraid of being taken in by their friend, and not satisfied with the fires prepared by the whites, brought with them a number of corn cobs, which they lighted and stuck in the ground.

They then brought forward the ostrich plumes, and proceeded to examine Bardik's buttons. And then began with much shouting and gesticulation a most animated debate on the nature of these pieces of metal.

What they said was unintelligible to all except themselves, but from their excited faces, eloquent grimaces, and occasional serious bursts of anger, it was obvious that the debate was one of much interest to them.

Suddenly the impassioned discussion was interrupted by an unexpected apparition.

and left at the Macalaccas thus taken in the very act of disobedience.

"Lopepe! Lopepe!" yelled the unfortunate savages, scattering on all sides like a lot of rats.

But a ring of black warriors appeared from among the bush-clumps surrounding the camp and barred their passage.

Lopepe immediately possessed himself of the buttons. After carefully examining them by the light of the maize torches, he dropped them with signs of much satisfaction into his leather pouch. Then he stepped up to Bardik, and taking away the feathers that had already been handed over, he appropriated them in the same way as he had done the buttons.

Of this scene the whites had remained passive spectators, having no excuse for interfering in it. Lopepe, however, solved the difficulty by advancing towards them, stopping a few paces off, and in an imperious tone delivering a long address, which was almost unintelligible.

Hilton, understanding a few words of Bechuana, succeeded in catching its general drift. The Kaffir chief protested against Bardik being allowed to trade with the Macalaccas when they possessed no property of their own, and expressed his intention of confiscating what he had

found as contraband, and asked what they were going to do.

Opinions were divided. Pantalacci wished to give in at once rather than cause a disturbance with the Bechuanas. Hilton and Cyprien were afraid that by doing so Lopepe's arrogance would be encouraged, and still greater risk run in consequence.

After a short whispered consultation it was agreed to abandon the buttons to the Bechuana and to claim the feathers, and this Hilton explained to the chief in a few Kaffir words eked out by pantomime.

Lopepe then assumed a diplomatic air, and seemed to hesitate; but the guns he caught sight of in the gloom soon decided him, and the plumes were given up.

Then the chief, who was really a very intelligent fellow, made himself somewhat more agreeable to the three whites, and to Bardik and Li he offered a pinch from his tobacco pouch, and then sat down at the bivouac. A glass of something offered him by the Neapolitan put him into excellent humour, and when he rose, after an hour or so, during which silence not unfrequently reigned for minutes at a time, it was to invite the travellers to visit him in the morning at his kraal.

This was promised, and after shaking hands Lopepe majestically retired.

He had not been gone long before all in camp were asleep except Cyprien, who, wrapped in his blanket, lay gazing at the stars. There was no moon, but the black field of the sky was aglow with its glittering dust.

He thought of his people, who knew nothing of this plunge of his into the South African desert. He thought of Alice, dearer than all to him, who was, perhaps, at that moment, stargazing as he was; and sinking deeper and deeper into his reverie he was about to fall asleep, when a trampling of hoofs, a curious agitation on the side where the bullock team was parked for the night, made him wake up and start to his feet.

In the shadow Cyprien fancied he saw a dwarfish figure, more compact than that of the oxen, and this he took to be the cause of the agitation.

Without a thought as to what he was doing Cyprien seized a whip lying close by, and stealthily moved towards the cattle.

He was not mistaken. In their midst, come to trouble their sleep, crept an intruder.

Hardly awake, and not thinking what he did, Cyprien raised the whip and brought it down with full force on the animal's snout.

A fearful growl arose as the reply to this sudden attack.

It was a lion! and the young engineer had treated it as if it were a cur.

He had only just time to snatch a revolver from his belt and step aside as the lion came leaping on to him and seized his outstretched arm.

Cyprien felt the pointed teeth grip into his flesh, and was borne to the ground by the angry beast. Suddenly there was an explosion, the lion's body gave a last writhe, stiffened, and fell back motionless.

With the hand that remained free Cyprien had coolly aimed his revolver at the monster's ear, and an explosive bullet had shattered its head.

The sleepers, aroused by the growling and the report, came running on to the

battle-field. Cyprien was half crushed under the weight of the beast, but his wounds were merely superficial. Li bathed them with a little lint steeped in brandy, and then the best place on the floor of the waggon was given up to the wounded man, and soon all were again asleep except Bardik, who remained on guard till the morning.

The day had hardly broken when the voice of James Hilton, begging his comrades to come to his aid, proclaimed that something else had happened. Hilton was lying fully dressed on the front of the waggon across the tarpaulin, and in an accent of the keenest terror told them without daring to move,

"I have got a snake curled round my right knee under my trousers. Don't move or I am a lost man. But see what you can do for me."

His eyes were dilated by fright and his face was of livid paleness. Under his trousers and round his knee was some foreign body like a piece of rope rolled round the limb.

The situation was serious. As Hilton had said, the first movement he made the snake would strike him.

But amid the general indecision Bardik resolved to act. Having noiselessly drawn his master's hunting-knife, he approached Hilton by a sort of worm-like movement that brought him almost imperceptibly towards him. Then with his eyes at the level of the snake he seemed for some seconds to carefully study the position of the dangerous reptile. Obviously he sought to discover how the animal's head was placed.

Suddenly, by a quick movement, he rose. His arm dashed down, and the knife gleamed as it cut in deeply across Hilton's knee.

"You can knock off the snake. He is dead!" said Bardik, showing all his teeth in a gigantic smile.

Hilton obeyed mechanically, and shook his leg. The reptile fell at his feet.

It was a viper, and had a black head about an inch across. Its least bite meant death. The young Kaffir had decapitated it with marvellous precision. Hilton's trouser had a gash in it about six inches long, but his skin was not even grazed.

It was a curious thing that Hilton did not appear to dream of thanking Bardik. Now that he was out of danger he seemed to consider the intervention quite as a matter of course. The idea never occurred to him to seize the Kaffir's hand and tell him he owed him his life.

"Your knife is very sharp," was all he said, as Bardik replaced it in his sheath without appearing to think very much of what he had done.

The impressions of this eventful night all faded off during breakfast, which on this occasion consisted of a single ostrich egg cooked with butter, and quite sufficient to satisfy the appetites of the five travellers.

Cyprien had a slight fever and his wounds were somewhat painful. He insisted, notwithstanding, on joining Pantalacci and Hilton in their visit to Lopepe's kraal. The camp was thus left to Bardik and Li, who undertook to skin the lion—quite a monster of the so-called dog-muzzle species.

The Bechuana chief awaited his guests at the entrance of his kraal surrounded by his warriors. Behind them, in the

second rank, were grouped the women and children, eager with curiosity to look on the strangers. A few affected indifference. Seated in front of their hemispherical huts they continued at their work. Two or three were making a net with some long textile weeds twisted into string.

There was a general look of misery about everything, although the huts were fairly built. That of Lopepe was raised a little in the centre of the kraal. It was much larger than the others, and covered with straw mats.

The chief led his guests inside, pointed to three stools, and seated himself on one in front of them, while the guard of honour formed a circle behind him.

The interview began with the usual interchange of civilities; in short, the ceremonial mainly consisted of drinking a cup of fermented liquor, made by the amphytrion himself, and each time the chief, to show that no perfidious scheme lurked behind, first raised the cup to his own thick lips before passing it to his visitors. Not to have drunk after such a gracious invitation would have been a deadly insult. The three whites drank the Kaffir beer, not without violent grimacing on the part of Pantalacci, who

they could not grant him, although he offered for it a very passable horse and a hundred and fifty pounds of ivory. In fact the colonial edicts are very strict on this point, and forbid Europeans disposing of any weapons to the Kaffirs on the frontier except under special authority from the Government. To make up for this Lopepe's guests had brought him a flannel shirt, a steel chain, and a bottle, which constituted a splendid present and gave great pleasure.

The Bechuana chief, through Hilton, was only too happy to furnish all the information in his power. In the first place a traveller, answering in every respect to Matak, had passed the kraal five days before. This was the first news the expedition had had of the fugitive for a fortnight, and it was received with gratitude. The young Kaffir had lost several days searching for the ford across the Limpopo, and now he was making for the mountains to the north.

Would it take him many days to reach the mountains?

Seven or eight at the least!

Was Lopepe the friend of the chief of the district to which Cyprien and his friends were going?

Lopepe gloried in being so! Who

"The Bechuana Chief awaited his Guests."

said in a whisper that he would rather have had "a glass of spirits than this nasty brew of the Bechuanas."

Business then began. Lopepe wished to buy a gun; but this was a satisfaction

would not be the friend and ally of the great Tonaia, the invincible conqueror of the Kaffir lands?

Would Tonaia give a good welcome to the whites?

Yes, because he knew, like all the other chiefs, that the whites never failed to take vengeance when those belonging to them were hurt.

What was the good of fighting the whites? Were they not always the stronger, thanks to the guns which loaded themselves? The best thing was to remain at peace with them, to receive them cordially and trade loyally.

Such was what was ascertained from Lopepe. One thing only was of much importance, and that was that Matakhi had lost several days on the road, and that they were still on his track.

On returning to the camp, Cyprien, Pantalacci, and Hilton found Li and Bardik considerably alarmed. They had, they said, received a visit from a lot of

Kaffirs of a different tribe from that to which Lopepe belonged, and these had subjected them to a strict cross-examination.

"Whence came they? Were they not spying on the Bechuanas, collecting information about them, finding out their number, force, and equipment? It was not for strangers to engage in such an enterprise! The great chief Tonaia would have nothing to say so long as they did not enter his territory, but he would look on things with a different eye if they did cross his frontier."

This was the general drift of their remarks. The Chinese did not seem to be unreasonably scared. But Bardik, usually so composed, was suffering from quite a serious fright, and this Cyprien could not understand.

"Wicked warriors," he said, rolling his large eyes, "warriors who hate the whites and their 'be-quick'!"

What was to be done? Was much importance to be attributed to the incident? No! The warriors had done no harm and shown no disposition to pillage. Their threats were harmless. The great chief Tonaia only wanted a few civil remarks and explanations as to what really had brought the white men into the country, and all his suspicions would vanish and his good wishes would be gained.

It was agreed by all that they should keep on. The hope of catching Matakhi and recovering the diamond overshadowed all other anxieties.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy Earl," etc.

CHAPTER VIII.—TENTERTON.

WE left our young countryman in the hands of the doctor, whose dextrous treatment had contributed so much to Tenterton's recovery. Tenterton was able to walk about now with a stick, and was very anxious to begin work, which Strammeller emphatically prohibited.

"It is of no use. The schools have commenced work, and none of those who want English have any time for it. Where did you learn German?"

"The little I know was taught me by a friend of my father's; not a very good teacher, I fear, to judge by his pupil."

"Oh, yes, I understand you very well. You do make a hash of the genders, but you are easily understood, and then you understand everything I say to you, which is perhaps of more consequence."

"It seems such nonsense," replied Tenterton, "to regard a lamp as a lady and a table as a gentleman, the former being feminine, the latter masculine; and most words for girls and women are neuter! I find it hard to recollect which is which in conversation."

"Practice, my young friend; practice makes perfect; and, really, from the practice we have had together, you have become much more proficient than I had expected in that short space of time. I wonder that you English do not cultivate German more; it would help you to understand your own language better. But we are growing quite philological, which is not amusing for you."

"On the contrary, I enjoy such a chat with you, so pray talk on."

"Hush! there are the bells. Madame Abrazoff is coming, so you will be able to hear the beloved 'th' again, which I confess puzzles me."

The pleasant bells (which a Russian has described to be the poetry of travelling) were heard noisily asserting their claims on the attention of all concerned in their approach. In short space the carriage, with its three horses, drove up,

and Madame Abrazoff, accompanied by Fräulein von Drachenhausen, alighted, and was duly received by the doctor and his patient.

"Now, doctor, here is a countrywoman of your own to talk to," said Madame Abrazoff, "and while I and Mr. Tenterton chat in such English as I can command, you and the fräulein can converse in peace."

"But Mr. Tenterton speaks German too," said Strammeller. "We have got on famously in that as well as in physical strength, and I have no doubt that another fortnight will see him a sound man and a good German."

"I congratulate you," said Madame Abrazoff. "I had no idea that you were such a linguist. French you speak perfectly, and I am sure you have profited by your stay here to learn Russian."

"Ne mnozshko" (a little), answered Tenterton, smiling. "But Russian is too difficult for those who have not had the honour of being born under the Imperial flag ever to hope to acquire. At least one must begin from very early boyhood before there can be any hope of progress."

"You are too severe upon our lovely language, but your using the words 'early boyhood' reminds me of a letter from my husband about which I want to consult the priest. I was told that I should find him here."

"He was expected here this morning, but has not yet turned up," said Tenterton, in English. "He often comes to assist me in my Russian, and I quite look forward to his visits. Do you know, we have had some most interesting conversations on religious matters, and he is, with all his simplicity, a very well-read man. I am giving him lessons in English in return for his aid to me in Russian, and the lessons I receive from him are most enjoyable. I am expecting him to give me one now."

"Then I will wait here for him. Do you think you would be better for a

drive? I should like to show you how the new building is progressing."

"Just the thing for him," said Strammeller; "only he must not climb into the carriage."

"How are we to get him in, then?"

In answer to this question the gigantic Prussian took the young Englishman in his arms as a nurse takes up a sick or refractory baby, and placed him with the greatest ease and gentleness in the vehicle. Madame Abrazoff stepped in and they drove off, leaving the doctor and the fräulein to chat happily together about "Deutschland" and their dislike of Russia and the Russians.

So actively engaged were they in this agreeable talk that they never noticed the arrival of the humble priest, who had driven to one of the huts in the village before coming on to see Tenterton. The peasant who drove him in had fallen into earnest conversation with the owner of the cottage, and the meek servant of the church, unwilling to interrupt their chat, did the rest of the distance on foot. He approached the verandah, which had been rapidly constructed for Tenterton's convenience, and was standing in the room before the two Germans, in their animated discussion, had time to be aware of his presence.

"Good morning, doctor," said the priest, taking no notice of the "start" he had given the lady (though it seemed odd to him that she should have been started at all). "Good morning, fray-layn" (so the Russians pronounce fräulein); "what has become of my interesting pupil and your model patient?"

"Oh, he is out!"

"What—gone for a walk?"

"No, I should hardly have allowed that, but he has gone for a ride with Madame Abrazoff."

"Otchen chorascho" (very good) was the reply. "Our English friend is in luck, first in having such an admirable medical friend as you—"

"And secondly," interrupted Stram-

meller, "in having such a good teacher as you!"

Whether this were meant as genuine praise or a sneer, the priest received it as a compliment, and with a bow that would have become an emperor, said,

"Oh, yes, I used to give lessons when I was in the seminary, and was accounted a good teacher then, and I like teaching. But that is not what I was thinking of when I spoke of his advantages. I was referring in my own mind to his good fortune in being so kindly provided for by the Abrazoffs."

"I don't think they could do less than provide for him," said the doctor. "He risked his life in their service, and is perhaps lame for the rest of his days in consequence of his exertions for them."

"True," replied the priest; "but I question whether in France, Germany, or England gratitude would have meant so much liberality as here in Russia. We Russians never forget kindness."

"I don't know about England," said Strammeller, "nor can I answer for France, but I am certain that in Germany there would be no end to the presents and other weighty expressions of gratitude for such service."

Here the conversation was interrupted by the bells of the returning carriage. As the doctor bore Tenterton back to the ingenious couch which he still used as a chair, he asked,

"Not shaken by the trip, I hope?"

"Not in the least; feel ever so much fresher."

Madame Abrazoff had gone into the house, and there found the priest and the fräulein still disputing, and she was much amused to hear the young lady speaking Russian, which she did after a fashion peculiar to herself.

"Good morning, Simeon Illitch. What a wonderful teacher you are! You make all my foreign friends speak Russian in no time!"

"You see it is their consideration for me," said the priest, "knowing that I cannot be expected to learn their forms of speech—German, French, and English; they accommodate themselves to my poor capacity."

"I did not think you could be so sarcastic, Simeon Illitch! But you were all so hard at it that it is a wonder you heard our bells at all. May I ask the subject of your debate?"

"We were speaking of the charitable custom so very prevalent in Russia of rich persons adopting the children of very poor parents, educating them as their own, and making them their heirs."

"What a curious coincidence! Do you know I have been looking for you on purpose to have a chat with you on that very subject? Of course you recollect a little boy who was confided to your charge by a dying peasant woman, and which boy you adopted as your own, but who was afterwards taken care of by a rich merchant in Moscow?"

"You mean little Ivan Dobroff. I shall never forget him. I could write a book of his early adventures and reckless daring!"

"A letter from my husband tells me that he is making quite a sensation at Moscow."

"Why, in what wonderful light has he appeared to the Moscovites?"

"That's just the very question. It is not his appearance, but his disappearance, that has puzzled them!"

"Batuschka! How! is he lost?"

"Vanished without a trace—gone!"

The very highest authorities are mad about him. Fancy! our dear friend General Zakovskie has been interviewed by the police in the hope of gathering information from him, and now they want me to find out what *you* know about him and his belongings."

Tenterton was sitting close to the priest, and as the conversation was carried on in a loud key, he heard every word that was said, and, proud of his progress in Russian, he asked Madame Abrazoff whether he had understood her aright. She, delighted with his proficiency, continued to speak still more distinctly, and occasionally translated a difficult expression into English.

The story obtained from the priest continued as follows. He had been sent for some six or seven years ago to attend the deathbed of an old woman named Olga Ivanovna, who had entrusted to his charge a little boy, saying that he had been given into her care by a rich and powerful "barin," who had forbidden her to reveal his name.

Tenterton started on hearing these words, and the first impulse of his young and ardent temperament would have led him to exclaim, "Why, it was Mr. Abrazoff!" for the name of the peasant woman after whom Abrazoff had so carefully inquired, and the news of whose death seemed to irritate him so fearfully, was no other than Olga! He had, however, sufficient self-control to repress all exclamation, but gave an involuntary start.

"I am sure the wound is painful," said Madame Abrazoff. "It was inconsiderate in me to take you out. I am afraid we have undone all the good."

"It is really nothing," said Tenterton; "only just a little momentary twinge. Does the doctor think his good work could have been so rapidly undone?"

"No, I do not," said Strammeller, decidedly. "But I do not understand why he should have had a sudden twinge of pain like that. The injury done to the bone seems to me to be entirely remedied. I think, indeed, that he might even walk without danger; only, as a medical man, I like to be cautious, and if I am mistaken in keeping him so quiet, it is erring on the right side."

"How soon do you think I may start for Moscow, doctor?"

"You had better remain three or four weeks longer."

"That is very disheartening."

"Why do you wish to leave us?" inquired Madame Abrazoff. "Are you tired of the country? Do you fancy that our quiet Asiatic-looking Moscow will in any degree remind you of noisy, dirty London?"

"Certainly not; and it does look ungrateful in me to wish to run away from such friends as you have all become. But I am getting very uneasy about this position in the family of Count Schaafstadt, for I want to work."

"There is no occasion for you to work, and I will not hear of your removal until you are quite strong enough to bear it. Nowhere could you be so quiet as in this snug little village. Now, Simeon Illitch, let us go on with your story."

"There is nothing more to add. The poor woman always told me that the boy was the son of a poor soldier who was killed at Plevna."

"Many, many Russian homes were desolated by that cruel war. We ourselves suffered severely," she added: "Mr. Abrazoff's elder brother was killed there too."

"Was he married?" asked Tenterton.

"Yes, to a very beautiful young lady, who, with her little son, followed the march of the army under Skobeleff, but nothing was ever heard of them. He was killed, fighting bravely under the 'white general.' But of them nothing was ever heard again, and it is supposed that they were among the numbers of those who perished in that terrible campaign."

This account seemed greatly to agitate the young Englishman, and Strammeller gave it as his opinion that he was not strong enough for such a strain on his attention as trying to follow so much rapid Russian.

The priest said that all he knew of the matter had now been told, and that if the doctor thought the patient too weak for more Russian then, he would call tomorrow. Madame and the fräulein took leave, so that Tenterton and the doctor were again alone.

"I can't think what is the matter with you," said the latter, after careful examination of the injured limb, directly the guests had departed. "The bone is all right, and where there was a dislocation of the hip-joint there is now nothing abnormal. In a fortnight, or at most in three weeks, I shall be able to let you go to Moscow. But excuse me, I am a much older man than you, and have taken so much interest in you, that I may be pardoned for speaking like a friend."

"I cannot be sufficiently thankful to you for all you have done for me, and for the sympathy you have shown in my troubles. It is absurd for you to apologise for taking a friendly interest in so friendless a creature as I."

"Not so friendless, my dear boy. You have already made friends here, and if I am not greatly mistaken they are true friends, who are most willing to aid you in every way. Now what I want to say is this: Do not allow any romantic or exaggerated feeling of pride to interfere with your true interests. They have recommended you in the strongest terms to perhaps the most important man for your purpose in all Russia. Don't fling this chance away. Of course, you know your own affairs best, and you may not require their aid—you may not want to go 'tutoring'; but if you have really come to Russia for this kind of work, you should be very careful first not to offend such friends as never turn up twice in a lifetime; and secondly, not to throw away the best chance ever man had to get his foot well on the ladder. You don't feel offended, I hope? And if you do, I can't help it; I have done my duty."

Tenterton wrung the doctor's hand as he said, "Offended at one of the kindest speeches ever made, and with you, who have shown yourself a friend such as can indeed only turn up once in a lifetime!"

"Don't be silly! I thought English people were not given to the romantics, dramatics, or whatever they are; I dislike those 'ies' very much. What you have got to do is to keep quiet, get well as quick as you can, and then be off to Moscow under the aegis of these good people. I shall come with you, for Abrazoff has really found some patients who

will, I think, prove interesting. He has offered me a suite of rooms in one of his houses, and I am only waiting for you to begin a new life with renewed vigour in a new capital. Only I must insist on no relapse on your part; that would throw me out altogether. You must be a 'good boy,' and do what I, your doctor, advise."

"I have no stupid feelings of pride in the matter, my dear doctor. If I had you would have conquered them all by your charming way of attacking them. Still, I have strong reasons to return to Moscow, and also to depend as little as possible on the patronage of these people."

"No doing anything with an Englishman," said Strammeller, much annoyed. "Well, I shall go for my ride and return in about an hour to dinner, and then I

hope to find you more tractable. Good-bye."

The good doctor left the house, and in a few minutes was galloping through the village to find an appetite. He was attended by two dogs which had attached themselves to him and always accompanied him in his walks and rides. He would not yet allow Tenterton to ride, although he believed the cure really effected, because he wanted nature to have full swing in setting up his favourite patient once again, and he feared to allow him any violent exercise until the danger was completely over.

Tenterton, thus left to himself, fell into a deep study, in which very anxious thoughts were evidently passing through his mind. He took up his book of conversations, one of which he learnt every day, but he could not fix his attention

upon the page. At last he rose and said aloud, "No, I can't stand this for another fortnight. The excitement and suspense and uneasiness will send me mad—mad as a hatter. And how to get away I cannot tell. Fifty miles over cross-country before ever a station is reached is bad, to begin with. Then I don't think I have enough to pay the fare to Moscow. How I wish that German would listen to reason and let me go! Three weeks? Impossible!"

Here he sat down, and was so wearied by his excitement that he fell into a sound sleep, from which he was awakened by the return of the doctor and the preparations for dinner. Strammeller knew how to lead his thoughts into another channel, and a pleasant afternoon was the result.

(To be continued.)

"The gigantic Prussian took the young Englishman in his arms."

JOE SIEG.*

WHEN, in a tale of old romance, you read some deed of fame,
You are spurred to emulation. Ah! if you could do the same!

Could vanquish with your single arm a score of fearful foes,
Or steer a fate-doomed vessel through the Arctic bergs and floes!
You find your daily duties unheroic, burdensome:
Well, never mind; some day, perhaps, the longed-for chance may come.

Not many months ago, my lads, Joe Sieg obtained *his* chance
To do a deed of daring never read of in romance.
He could not boast of high degree, he only drove a train
From town to town, day after day, in sunshine or in rain.
Monotonous you think it?—yes, a humdrum sort of work,
But yet 'twas just the very kind 'twas dangerous to shirk.
Swift ran the train from town to town on this eventful day;
The passengers in laugh and chat beguiled the hours away,
Till one by one the people who were near the windows thought
A scent of something burning by the passing air was brought.
'Twas engine smoke they fancied, so the windows were fast shut;
Then a glare lit up each carriage as they entered Bergen Cut.
From every window heads were thrust to learn what might transpire;
What is that fearful, piercing cry? "We're lost!—the train's on fire!"

The engine was a mass of flame; so furious was its force,
The drivers, scarce escaping, left the train to take its course.
The rapid progress fanned the flame, the sparks flew out like rain,
What hope to reach the lever which alone could stop the train?
The burning mass rushed onward like a meteor through the sky,
The swift wind fanned the cruel flames and made them burn more high.

Cold ran the blood of every man and blanched grew every cheek,
The roar of fire was almost drowned by piercing yell and shriek.

Six hundred precious souls were there, closed in a cage of flame,
A flame which grew more deadly as it near and nearer came.
"We're lost! can no one save us?" was the universal cry;
Then Joseph Sieg stepped forward with the simple words, "I'll try."
He pulled his oilskin cap well down, and with a long-drawn breath
He started on his journey for a stand-up fight with death.
Each eye beheld the hero as he crawled into the smoke,
Which wrapped itself around him like a monstrous funeral cloak;
It shut him from their anxious gaze, until a burst of flame
Revealed him creeping on and on, still faithful to his aim.
But onwards still the engine rushed, as though 'twould never tire,
And farther spread the thickening smoke and fiercer ran the fire.
"He'll never do it! we are lost!" and cries of deep despair
Rose once again upon the breeze, mingled with frenzied prayer.
"He's burnt to death!" the cry goes up as dies their one last hope;
How could one feeble man expect with such a foe to cope?
But what is this? Hope lights each eye, and hands are warmly pressed,
The fearful speed grows slower,—still more slow,—the train's at rest.
From out their dreadful prison-house the rescued people leap,
With fevered throats they gladly shout or in their frenzy weep;
No longer do the angry flames their ghastly terrors spread,
When "Where's Joe Sieg?" cries every one; "is he alive or dead?"
Upon the tender's burning mass he lies in fearful throes,
Strong hands uplift his tortured limbs, how tortured no one knows.
The red-hot bars have seared his flesh, his limbs are burnt and black,
Too late has come the rescue, for his manly head falls back;
Too strong for him has been King Death, whose terrors he has braved,
He lies beyond all earthly aid in the arms of those he saved!

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXIII.

LANG retired to his bedroom as soon after dinner as he could on the evening of the first day of his exam., not, however, without having to still further steep himself in the atmosphere of deception in which he was now living.

"I hope you have got on well to-day," said Mrs. Hawtrey, during dinner.

"Pretty well, thank you," was his reply.

"You look tired; you must not work too hard in the evening; you must reserve yourself for the day."

"I don't think I work too hard, and I want to pass very much."

"Naturally; but you won't do yourself justice if you don't feel at your best. Give up work for to-night, we are going to have some special music this evening. Mr. Palliser has promised to bring out his violin, and Meggie is going to sing."

There was nothing that Lang would have preferred, but he dared not face the roomful of people. It was bad enough to have to dine with them; he could not stand spending an evening in their company. Their very happiness was a reproach to him.

He shut himself up in his room and tried to read a story, but could not get along. Then he took out his chemistry, and forced himself to study that. There was some sort of consolation in feeling that even if he were not passing his exam. he was making himself fit to do so.

But he was not destined to spend the evening undisturbed. A knock was heard at his door, and the servant called out that a gentleman wished to see him.

A terrible thrill of fear ran through him, but it was over in a moment. It was absurd to think he had been found out and that some one was waiting to take him into custody. Of course his visitor was Fanshawe.

It was. His friend was waiting for him in the hall, smoking.

"How are you, my boy? Shall I come up to your room, or shall we have a little fresh air?"

"Let's go out," said Lang, who had a horror of being seen in the company of his accomplice. "I'll be down in a moment."

"All right; I'll stroll up and down outside."

Lang joined him in a minute. They began walking south through the squares.

"How have you got on?" asked Lang.

"Oh, pretty fair; quite good enough. I found myself rustier than I expected though in details, and I haven't had so much time to give to rubbing them up as I hoped."

"You aren't afraid you'll be ploughed?" asked Lang, eagerly. It would be too terrible to have all this deception and anxiety end in failure.

Fanshawe laughed. "Oh, bless you, no; I'm safe as the church. There's one little dodge of schooldays which I haven't forgotten yet. Do you remember this?"

He pulled down his shirt cuff from his sleeve; it was covered with minute notes and figures.

"Hey presto!" he exclaimed, as the cuff slid up his arm again. "I think that will help me over any little difficulty."

Lang did not know what to say. He was revolted, for, strange to say, he would never have dreamed of cheating at an examination. So complicated and inconsistent may become our notions of right and wrong, of what is allowable and what

is out of the question, that often a man who will shrink from one class of actions will commit others just as discreditable without hesitation.

"I've had rather a fuss with my governor," continued Fanshawe. "I've been taking rather more than my usual share of holidays lately. I had to invent a touching story of the expected death of an aunt to get him to let me off this week. So we're both of us rather in hiding just now."

Lang could not help feeling a contempt for his companion. Yet what right had he to do so? Was not he doing exactly the same thing?

In fact, was he not the more guilty of the two? Fanshawe was only passing again an examination in which he had already distinguished himself; he, on the other hand, was seeking to enjoy the benefits of a test of ability he was afraid to face.

Yes; it was worse than absurd to try and feel that he was the better man. Much wiser to kill all thought of right and wrong, and look upon the whole business as perfectly indifferent, as Fanshawe did. Until he could manage to do this all enjoyment was out of the question.

"Where shall we go?" asked Fanshawe.

"I don't care," replied Lang, desperately; "anywhere you like."

"All right, let's drop in at a music-hall; there's always something or other worth seeing."

Lang had never been to a music-hall, and was rightly under the impression that they were very low places of entertainment. However, he was in the mood for anything that might be suggested, so he followed Fanshawe into a big hall, first paying a shilling for his entrance.

It was brilliantly lighted, too brilliantly, for the gas had burnt up all the air, and the atmosphere was suffocating. The place was full of smoke, too, and Lang felt half choked.

"I don't think I can stand this," he said to Fanshawe; "it's knocking me over."

"Oh, nonsense! Have something to pull yourself together."

They adjourned to one of the bars, of which there were only too many. They remained some time, Lang wishing himself anywhere else.

"This is getting wearisome," he said to Fanshawe.

"Tis, rather; let's have another drink."

Lang declined, but that did not prevent Fanshawe from having one.

Lang decidedly wished he were at home. He wished he were in the drawing-room, listening to Miss Meggie singing instead of to the rubbish that he was condemned to sit out here. The people around him seemed to enjoy it, but he could not. He had not yet been educated down to it. He resolved that when he wanted amusement he would not come to a music-hall to seek it in future.

He wished he were well out of this one. Fanshawe was a little excited with the whisky he had been imbibing, for he had treated himself to some before calling on Lang. He now began to applaud in a vociferous manner. Lang tried to quiet him.

"Oh, shut up," was his reward.

"Shut up yourself, you young counter-jumper," said a sailor who was standing near.

"Not for you, my jolly Jack Tar," retorted Fanshawe.

Before Lang knew what had happened the sailor had sprung at Fanshawe, who ducked; the sailor fell over him; there was a brief *mêlée*, in which an official took part, and then they both disappeared through the door. It was all over whilst the crowd were repeating a chorus, and only a small fraction of the audience knew that anything had happened.

Lang made his way outside, and found the sailor being marched away by his companions, whilst Fanshawe was standing against a pillar, trying to make his crushed hat resume its shape.

"You let me go, Bobby," he was saying to a policeman who was standing by him; "I'll do for him."

Lang went up to him; they were in

the full blaze of light; how he hoped that no one he knew could see them!

"Come along," he whispered, taking his arm. "I must go back."

"Take him away, sir," said the policeman. "He'll get into trouble if he stays here much longer."

"All right, you Bobby, you mind your business," said Fanshawe, shakily, "or I'll take your number."

"Guess it's more than you'll remember by the time you get home," grinned the policeman.

Lang led him along the passage and into the open air. He took him up a quiet street, and the cold air partly pulled him together.

"All right, Lang, you needn't grip my arm so tight; I'm not going to fall, don't you fear. It was that atmosphere made me feel seedy for a moment."

It always is the atmosphere, or the salmon, or something, which makes young fellows on the downward road make asses of themselves. It is never the bad whisky they have drunk; oh, no! that would be a confession that their heads were not as strong as they would have them thought to be. Silly moral cowards!

Lang dropped his companion at the corner of Tavistock Square, and made the rest of his way home alone.

"I've been a fool," he said to himself. "This is the sort of fellow I've chosen for a chum, and he knows all about me, even that I was suspected of thieving at St. Mary's. I was mad to tell him that. The only good it may do is that he may come across Melhuish one of these days; he's always on the look-out for him to get back his money. If he does meet him I shall take care to hear of it, and I shall be able to clear myself about the football cash at any rate."

But this was manufactured comfort, and did not afford him much consolation. What was far more present to his mind was the fact that there were several more days of examination, and that he would have to contrive somehow or other to keep himself hidden. If he had been an outlaw it could not have been worse.

(To be continued.)

WITH THE INDIANS OF THE NORTH-WEST.

BY THE MARQUIS OF LORNE.

THE long levels of the prairie spread sea-like on each side of the Canadian Pacific Line, but there are sudden breaks caused by "coulees" or ravines near the rivers; and we pass one of the greatest troughs cut out of the plains when we come to the Assiniboine, and, crossing it, soon afterwards enter the territory of Assiniboia; and here we leave Provincial Governments behind us and enter the lands which are under the genial but despotic rule of the Lieutenant-Governor of the North-West Territories, who, with his council, governs a country bigger than France and Germany. You will soon observe at one of the stations a fine-looking trooper, clean, soldier-like, with white helmet and brass spike on head, scarlet jacket and broad yellow-striped trousers, boots and spurs, and carbine in hand. This is a member of the North-West Mounted Police—a force now five hundred strong, and having charge to keep order throughout the country between this and the Rocky Mountains. This cavalry regiment is well horsed and well officered, and woe to any whisky-trader whose barrels

may come within their sight, for, owing to the trouble which spirituous liquors are sure to produce amongst the Indians, as well as amongst the white settlers in the initial stages of a country's development, none are allowed. Enterprising traders bring them in carts from the south, and often an exciting race occurs between the horses of the traders and the police, who have perhaps a long stern chase to undertake, but who finally ride up with pistols presented and make our friend disgorge his goods, which are forthwith spilt upon the ground.

The work which has to be undertaken by the members of the North-West Mounted Police in winter time has hitherto not been light, for the detachments are necessarily placed where they can be available in case of any arrest of horse-stealers being necessary. Horse-stealing is prevalent in those parts where settlement is scarce, and where the manners and customs engrafted on the half-breed population by their Indian ancestors still obtain. The western highwayman takes your horse—the most valuable possession he

can obtain—and the summons may come at a moment's notice that a theft has been committed, and it may be necessary to send a party of men prepared to camp upon snow, and to follow up the trail of the marauders.

We will suppose such a theft to have taken place, and the depredators to be Indians of the Cree tribe. The officer and his party, after two or three days' hard riding, have overtaken the redskins before they can cross the frontier. Now is seen of what advantage reputation or prestige—a thing sometimes derided nowadays—is in preventing bloodshed and maintaining order. The officer finds the Indians camped and numerous. Without a moment's hesitation he rides through the lodges to the chief's tent. He enters, his handful of men waiting in the meantime. He finds the chief, with his councillors round him, smoking in silence, and hardly daring to look at him. As he enters he says through his interpreter, that he knows that horses not belonging to the tribe have been run off. Grunts and universal protestation that nothing of the kind has occurred proceed from

An Indian Squaw with Papoose.

the savages. The officer maintains his ground, says that he knows the horses are in the camp, and that they must be at his bivouac before morning. Finally the chief says that it is impossible to give up the horses, that the young bloods of the camp would not allow him to do so even if he wished it. The officer now declares that the tribe will not be allowed to cross the frontier or move from the ground they now occupy until the horses are surrendered! He knows perfectly well that he could not enforce the demand, that the Indians are well armed, and that his own men

would be cut off in a moment should hostilities commence. Yet a whispered consultation now takes place among the chiefs, and in a short while a promise is given that the horses shall be in the officer's hands before the morning. Out of the tent strides the officer; and sure enough at dawn the horses are brought to him. He insists upon the surrender also of the men who first took them, and he marches off with these men under guard back whence he came. The secret of his power is this—that the Indians know that the red-jackets mete out equal justice to

white man and to red man, that a white settler would be punished in exactly the same way as the redskin for any crime he may commit, and that to set the Canadian authorities against the Indians will be for the Indians the cutting off of the only chance they possess of living in a country where they are treated with equal justice.

In a few more years no wild Indians will be seen except in the far north; and it is curious to observe them now, while as yet, in some tribes, their dress, manners, and habits are what they have been for centuries. As a

Blackfoot Indians crossing a River.

rule, they are well-made fellows, showing not so much muscle as a white man, but sleek and finely moulded in limb, and untiring in wind.

It is interesting to see how originally wild savage bands are becoming tame and half civilised. It is only a few years ago that near our line a band of Sioux, under the leadership of a chief named Sitting Bull, achieved a victory over a civilised force which has no parallel in the annals of any recent war between civilised and savage troops, except the single case of Isandula. General Custer, one of the most gallant officers of that gallant Northern army—a man distinguished for intrepidity and skill in the war against the Southern Confederacy—had been appointed to a command of cavalry not very far from our frontier line. As is too often the case, unnecessary quarrels had led to unnecessary fighting between Uncle Sam's boys and the braves under Sitting Bull. Custer, coming upon their camp in a place chosen with rare skill by the savages, impetuously ordered an attack. Accounts vary of the struggle which ensued, but the story must necessarily come from one side only, because no American soldier lived to relate the tale. The Indian account, given in Sitting Bull's words, is as follows:—

"During the summer previous to the one in which Custer attacked us, he sent a letter to me, telling me that if I did not go to an agency he would fight me; and I sent word back to him by his messenger that I did not want to fight, but only to be left alone. I told him at the same time that if he wanted to fight, that he should go and fight those Indians who wanted to fight him. Custer then sent me word again (this was in the winter), 'You would not take my former offer, now I am going to fight you this winter.' I sent word back and said just what I had said before, that I did not want to fight, and only wanted to be left alone, and that my camp was the only one that had not fought against him.

"Custer again sent a message, 'I am fitting up my waggons and soldiers, and am determined to fight against you in the spring.' I thought that I would try him again, and sent him a message, saying, I did not want to fight; that I wanted, first of all, to go to British territory, and after I had been there and came back, if he still wanted to fight me, that I would fight then. Custer sent back word and said—'I will fight you in eight days.'

"I then saw that it was no use, that I would have to fight, so I sent him word back, 'All right! get all your men mounted, and I will get all my men mounted; we will have a fight; the Great Spirit will look on, and

the side that is in the wrong will be defeated.'

"I began to get ready, and sent twenty young men to watch for the soldiers. Five soon came back with word that Custer was coming. The other fifteen stopped to watch his movements. When Custer was quite close ten young men came in. When he had advanced still closer two more of them came in, leaving three still to watch the troops. We had got up a medicine dance for war in the camp, and just as it was coming to an end two of the young men who had stopped out came in with word that Custer and the troops were very close, and would be upon the camp in the morning. That night we all got ready for the battle. My young men all buckled on their ammunition belts, and we were busy putting strong sticks in our 'coup

sticks.' Early at sunrise two young men who had been out a short way on the prairie, came to me and told me that from the top of a high butte they had seen the troops advancing in two divisions. I then had all the horses driven into the camp and corralled between the lodges. About noon the troops came up, and at once rushed upon the camp. They charged in two separate divisions, one at the upper end, whilst the other division charged about the middle of the camp. The latter division struck the camp in the centre of the two hundred and fifty lodges of the Uncapapa Sioux, and close to the door of my own lodge. At the time that the troops charged I was making medicine for the Great Spirit to help us and fight upon our side, and as I heard the noise and knew what it was, I came out. When I had got to the outside of

Indian Burials on the Plains.

Buffalo Hunting.

(From Catlin's "North American Indians.")

my lodge I noticed that this division had stopped suddenly close to the outer side of the Uncapapa camp, and then they sounded a bugle and the troops fired into the camp.

"I at once set my wife upon my best horse, put my war-bonnet on her head, and told her to run away with the rest of the women. She did so, but in her hurry forgot to take the baby (a girl); after she had gone a little way she thought of the child and came back for it. I gave the child to her and she went off again.

"I now put a flag upon a lodge-pole, and lifting it as high as I could, I shouted out as loud as I was able to my own men, 'I am Sitting Bull; follow me.' I then rushed at the head of them up to the place where I thought Custer was, and just as we got close up to the troops they fired again. When I saw that the soldiers fired from their saddles and did but little damage to us, I ordered all my men to rush through their ranks and break them, which they did, but failed to break the ranks, although we suffered as little damage as before. I then shouted to them to try again, and putting myself at the head of my men we went at them again. This time, although the soldiers were keeping up a rapid firing (from their horses), we knocked away a whole corner and killed a great many, though I had only one man killed. After this we charged the same way several times, and kept driving them back for about half a mile, killing them very fast. After forcing them back there only remained five soldiers of this division and the interpreter alive, and I told my men to let them live. Then the interpreter, the man that the Indians called 'The White,' shouted out in Sioux and said, 'Custer is not in this division, he is in the

other.' I then ordered all my men to come on and attack the other division. They did so, and followed me. The soldiers of this division fired upon us as soon as we got within range, but did us little harm. When we had got quite close, and we were just going to charge them, a great storm broke right over us, the lightning was fearful, and struck a lot of the soldiers and horses, killing them instantly. I then called out to my men to charge the troops and shouted out, 'The Great Spirit is on our side; look how He is striking the soldiers down!' My men saw this, and they all rushed upon the troops, who were mixed up a good deal. About forty of the soldiers had been dismounted by the lightning killing and frightening their horses, and these men were soon trampled to death. It was just at this time that we charged them, and we easily knocked them off their horses, and then killed them with our 'coup sticks.'

"In this way we killed all this division, with the exception of a few who tried to get away, but were killed by the Sioux before they could get very far. All through the battle the soldiers fired very wild and only killed twenty-five Sioux. I did not recognise General Custer in the fight, but only thought I did, but I would not be certain about it. I believe Custer was killed in the first attack, as we found his body, or what all the Indians thought was Custer's body, about the place that the first attack was made. I do not think there is any truth in the report that he shot himself. I saw two soldiers shoot themselves. The Sioux were following them, and in a few moments would have caught them, but they shot themselves with their pistols in the head. The body which all the Indians

said was Custer's had its hair cut short. There were seven hundred and nine Americans killed. We counted them by putting a stick upon each body, and then taking the sticks up again and counting them. We counted seven hundred and seven carbines."

It was greatly to the credit of the American people that when, years afterwards, we wished to get rid of Sitting Bull, who had taken refuge on Canadian soil, amnesty was granted to him and his people, and in reply to the query addressed by the Canadian Government as to his probable treatment should he surrender to the Americans, Mr. Evarts, United States Secretary, replied, "He will be treated as a great nation always treats its prisoners of war." We were anxious to be rid of his presence, for he and his five thousand were eating up the scanty game of our own Indians, and he himself, from his well-known astute and warlike character, gave anxiety to us, in that we never knew whether he were not harbouring against our republican friends some evil design. He was often reported as about to embark in a raid or cattle-lifting expedition, an amusement for him which it would have been difficult for us, at that time, to prevent, and which might have yet led to a rupture of that friendship and excellent understanding which has most happily always prevailed along our north-western borders. The redoubtable Sitting Bull and his tribe are now safely placed upon an American reserve of land, where the old warrior will be allowed to end his days in peace, and in whatever comfort the industry of his people and the generosity of the United States Government may bring him.

(To be continued.)

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER VIII.—THE AMERICAN FLAT-BOTTOMED CANOE OR SHARPIE.

FROM the illustration (Fig. 1), giving sheer plan, body plan, deck line, and the floor line (shown by the inner line), you will be able to form a very good idea of the

sharpie proper. As an easy boat to build, useful in shallow water, and fairly good under canvas with the centreboard down, the sharpie is perhaps without a rival.

a drogue, or sea-anchor, for twenty-four hours together. The plan given at Fig. 1 is about six feet long and a foot and a half wide, being approximately four beams to the

AMERICAN FLAT BOTTOMED CANOE WITH DAGGER CENTRE BOARD

SHEER PLAN

general form of this peculiar species of craft, which is a kind of link between a canoe and a boat, as a small sharpie is little else than a flat-bottomed canoe; while, on the other hand, there are sharpies built more than forty feet in length. The sneak-box is generally a smaller boat, differing in some details and more difficult to construct than the

The one that crossed from America (City of Ragusa) was some nineteen feet long by four or five feet wide, and two feet deep. I am only speaking from memory, as I unfortunately lost the notes I took when examining her. By the account of her adventurous navigators she made very good weather, though several times the sea was so bad they had to ride to

length and about eight inches deep amidships, on a scale of one inch to the foot. From this plan, by doubling the measurements, with the exception of the depth, which will be rather less proportionately, you can easily construct a boat twelve feet long, three feet wide, and the depth not to exceed one foot, which would be a handy and safe boat.

The first thing will of course be to decide the dimensions of the sharpie or sneak-box you intend building, and draw your plans to scale on a large piece of paper; and the next to buy some wood to proceed with. The floor of the boat will be the best basis to proceed on, and in a small craft—say ten feet by three feet—this can be made out of three nine-inch planks, as the bottom will be considerably less in width than the beam at the gunwale—say nine inches for the three-foot beam, which would give two feet three inches greatest beam at the bottom. The bottom planks had best be tongued and grooved. A good and easy way of doing this is to run a saw-cut down the plank to admit the insertion of a strip of zinc for a tongue.

opening for the well, and carlines or cross beams fitted running fore and aft on each side of the opening, and long enough to butt on the two beams, which should be stouter than the ordinary beams to take the extra strain which invariably comes at the ends of the hatchway or well. If necessary a sliding cover of the same paper can be fitted to the well. Such a boat is within the constructive capacity of any lad, as it does away with

the sprit. The American plan of fixing a rudder is by a watertight tube fixed just where the stern rises from the waterline aft. I should not recommend you to do this unless you are a fair workman, as you might establish a leak; you could fix a rudder from the square stern aft, letting it come down far enough to obtain a good hold of the water, and making it as shown in Fig. 1—that is, shallow and long.

AA REEFING BATTEN
CC " BRAILS
BB SPRIT FITTED AS A BOOM

American Sharpie, showing Sail Plan.

This zinc ought to be fairly thick to take a strain, and it makes a stronger job for small work than a wooden tongue; the bottom boards will have to be cut to the shape indicated by your plan (which will simply be an enlargement of Fig. 1, the bottom-board being shown by the inside line of the half-breadth plan). The fore-and-aft rise of floor is shown in the sheer plan and in the body plan, and the bottom board will have to be bent to this position to meet the edges of the side boards, which will be cut out to take this rocker in the plan. This is shown at A A A, sheer plan. As the side boards join the bottom boards at a certain angle depending on the beam aloft as compared to the width of the floor, the edges of the floor boards must be bevelled off to this angle. If a deck is fitted the sides may be made of boards a foot wide; but if undecked, the sides ought to be at least eighteen inches deep. The most simple plan of building one of these canoes would be to get out the floor boards (say one inch thick) to the requisite shape, and then carefully measure off on your plan the amount of stuff necessary for sides and deck, and buy sufficient waterproof paper (Willesden paper) for the purpose.

In either case (wood or paper) a stem and stern post must first be fitted to the bottom boards to take the ends of the side planks. If Willesden paper (which is about one-eighth of an inch thick) is used a wooden gunwale must be fitted to nail it to, and in this case it would be better to fit a few timbers or ribs between the stem and stern post each side to strengthen the boat, running the gunwale over all the ribs, but siding it on to the stem and stern post, which should project above it about an inch, and the projecting piece be bevelled off on the inside (i.e., that next the interior of the boat). If the paper is used it should be fastened to the gunwale with copper nails, and the deck secured in the same way, first running a few deck beams across and securing them to the gunwale by a mortise or other joint to give strength to the deck. There should be a certain amount of crop to the deck beams—that is, they should be semicircular, the highest point being amidships, which should be, say, two inches higher than the gunwales. A beam should be placed at each end of the

all trouble as to keel and fitting garboards, etc., and planking up and caulking.

After the deck is fitted a neat heading can be run over the junction of the deck and gunwale, and another outside to hide the edge of the paper side where it is fastened to the gunwale.

Even if it is decided to make the side of wood it would be advisable for the sake of lightness combined with strength to use the prepared paper for the deck. But if it cannot be procured light pine or cedar about a quarter of an inch thick will do instead; and if it is difficult to obtain wood sufficiently wide to deck the boat in one piece, a good job can be made by using two pieces joined down the middle in the centre of the boat fore and aft, such joint to be concealed and strengthened by a stout piece of mahogany or teak, say half an inch thick by three or four inches wide. Of course if you are going to use a mast this longitudinal strip must needs be wide enough to allow the mast-hole to be cut in it, or a wider piece can be inserted at the mast and the rest joined to it in two pieces.

It will be better if this form of construction is used to fasten the fore-and-aft strip to the two deck boards with small brass screws, screwed from the under side of the deck up into the strip, which is twice as thick as the deck, and better able to hold the screw; three-eighths screws will do, and the points should not appear through the mahogany. This of course must be done before the deck is screwed to the gunwales. After a deck is fitted, a coaming of three-quarter-inch stuff must be made to fit round the well; this coaming should be about an inch and a half high, and the end dovetailed. It will fit over the beams and carlines of the well, and will hide the joint of the deck with those fastenings, and make all complete. A rack should be fitted each side on the floor-boards to take the stretcher, and the back-board can be on the Rob Roy principle. If a sail is used, it would perhaps be best to adopt the American sail shown in the sketch; either one or two masts can be used. The batten A A, on being hauled close to the mast by the hauling-lines C C, which lead aft to the well, immediately reefs the sail; when this is done more sheet must be given to allow for the extra drift, or the sail allowed to run in on

If a centreboard is desired—and one must be fitted for sailing purposes, unless you use leeboards—a case must be made of wood one inch thick, the sides being spaced about one inch apart, and secured to the bottom boards by screws from the bottom of the boat up through the sides of the casing. A slot must be cut in the bottom boards in the centre line of the boat, at the place where the casing is to be fitted, sufficiently long and one inch wide; the ends of the case must be closed by a stout piece of wood one inch by three inches (hard wood preferably), well secured to the sides, and the joints of the casing with the bottom boards must be further secured by a beading run round them, the joint being first made water-tight with whitelead, and all the joints of the casing must be made water-tight in the same way. The upper part of the casing will serve to support the deck, through which a slot must be cut of the same form and dimensions as the one in the floor, and the deck screwed down tightly, a layer of whitelead being first given to the top of the casing and under side of the deck where it abuts the case; in fact every means must be taken to strengthen all the parts of the centreboard case and to see that all its joints are water-tight. The centre-plate can be made of wood or iron; if of wood a metal bearing must be fitted to take the pin on which it works, and such pin must be tightly driven (to prevent leakage) through holes bored at the forward end of the case about a couple of inches from the floor. A certain amount of drift must be given between each end of the case and the centre-plate to allow it to work easily. A hole must be bored in the upper after-end of the plate to fasten a chain or cord in order to raise or lower the plate as required, and some cleat should be fixed in a handy position to secure this chain or line to when it is desired to keep the centreboard in any required position without holding it.

If an iron centreboard is used the sides of the case may be spaced less than one inch; in fact just so close as to allow free play to the centre-plate; but if wood is used an inch will be quite little enough; in fact an inch centreboard would probably be required to give the requisite strength, and, if so, of course it would need the casing to be spaced suffi-

ciently apart, to allow it room to work properly, possibly one inch and a half. A centreboard three or four feet long, dropping below the boat eight or nine inches at the after-end, and coming to nothing forward, would be amply sufficient to enable the boat to beat to windward under sail. The best position for the centreboard is to allow it to come as far aft as it is possible consistently with giving sufficient room in the well for the occupant to stretch his feet.

If a deep rudder is used aft the centreboard might go more forward, but its best position will be about midships, and in that case the legs of the owner must be put on either side of it. This constitutes one of its inconveniences, and can only be obviated by having two small centreboards, one forward and the other aft, which leaves the midships free, and is far more comfortable for the crew. If the latter plan is adopted I should suggest that the fore centreboard be double the size (superficially) of the after one, as best suited to this form of boat, which has little or no hold on the water forward.

(To be continued.)

Correspondence.

QUERIST.—For badges and special ribbons try Kenning, Little Britain, E.C.; or you could get them through Goy, Leadenhall Street.

A LOYAL SUBJECT.—The National Debt was principally borrowed from our countrymen, and they are the nation's creditors at the present time.

H. F. W.—Inquire of the Secretary, Science and Art Department, South Kensington. We are under the impression that the free admission to the museum and library is given only to students who have passed first-class in the advanced stage in Science. The ticket is not perpetual; it has to be renewed.

G. E. C. P.—1. You can average the price of a boat at £10 per ton. 2. Follow the advice of your doctor. You will never be eligible for Government employment, and had better give up all thoughts of volunteering. Never talk to strangers of your ailments, or be guided by the advice they give.

NAUTA.—In swimming the legs yield the chief propelling power.

L. W. A. C.—The best red for magic-lantern slide-painting is carmine; you can also use crimson lake. A good brown is madder-brown; and the greens can be got by verdigris or Prussian blue and gamboge. The best colour of the lot is Prussian blue, though indigo is also available. The "transparent" black is ivory-black. Of the other colours, which however are not so transparent, you can take your choice between raw sienna, burnt sienna, cappa brown, and vandyke brown.

LEARNER (Birkenhead).—Almost any aniline ink will fade if exposed to the light. Mix any of the common dyes with cold water, and write with the diluted colour. If you can turn out parodies like that on the back of your letter there is no necessity for you to write them in ink that will fade into nothingness. They would suit some of our readers to a T. Why not send a copy to Lord T.?

Half a league, half a league,
Half a league onward;
Into THIS TEA-SHOP
Plunged many hundred.

"TEA!" is the nation's cry;
"Whose is the best to buy?"
"Yours, most certainly,"
Shout many hundred.

Tea shops to right of us,
Tea shops to left of us,
Tea shops around us,
All, all have blundered.

Armed for the tea-pot trade,
Here we stand undismayed,
Asking the people's aid,
For no HIGH CHARGE is made;
So come, many hundred.

Come, then, to right of us,
Come, then, to left of us,
Come, then, before us,
We never have blundered.

Stormed at by those who try
Tea good as ours to buy;
Failing most dismally,
Fail many hundred.

None can such GOOD TEA sell,
That is now known full well;
From all we bear the bell,
Say many hundred.

When shall our glory fade?
"Oh! the light charge that's made!"
Shout many hundred.

POLE.—You can get French polish at almost any colourman's. At Gedge's, 90, St. John Street, Clerkenwell, you can have your choice of a dozen polishes, at prices varying from four shillings to ten shillings per gallon. Stains cost about four shillings and sixpence per gallon.

DON JOHN OF AUSTRIA.—No British regiment is quartered in a colony belonging to a foreign State. You can obtain particulars on applying to headquarters, or consulting one of the many military books published by Clowes and Son, Mitchell, or Stanford, all of Charing Cross.

FRANK H. (Victoria).—1. The first stroke of the bell is that which tells the time. Were it not so the clock would begin to strike at a different interval before each hour. The chimes serve as a caution. 2. We have never met a jeweller who gave a guinea for cigar-ash, nor have we ever seen a voucher for any such transaction. Thanks for the complimentary notice cut from the colonial paper.

A WOULD-BE SOLDIER.—All inquiries as to recruiting receive the same answer—apply at the nearest post-office for the pamphlet issued at Government expense for the information of all wishing to join the army.

DAVID.—A certificate from the Science and Art Department might procure admission into the designer's room in some of our large manufactories. Engraving in the majority of instances is purely a mechanical art.

JAMES BLACK (Manchester).—We have forwarded your letter to Mr. Theodore Wood, who replies as follows:—"1. No. If you dip the cards into the solution the gum will be partially or entirely dissolved, according to the length of time during which you leave them immersed. 2. Yes, by all means. 3. Your best plan will be to remove, with great care, the verdigris-covered pins, and re-pin the insects. The old hole of course will remain, but is far less disfiguring than the verdigris. You are in a capital district for entomological work, and ought to meet with success."

A LANCASTHIAN.—Your drawings are not sufficiently accurate to be of much use for purposes of identification. Of the eggs, No. 1 may possibly be that of a Tree Pipit; No. 2 looks like that of the Garden Warbler; Nos. 3 and 4 belong to one of the Titmice; and No. 5 is possibly a Willow Wren's. We cannot answer positively, however, without seeing the eggs themselves. Of the birds, No. 1 is the Baltimore Oriole. The remaining two are unlike any birds we have ever seen. Have you coloured them correctly? And where did they come from? Our plate of Birds' Eggs can still be had by purchasing the part in which it appeared.

H. SPENCER.—Your insect is a specimen of the common Tiger Moth (*Arctia caja*).

A. G. SHAW (Wincanton).—Your letter and its contents arrived in a most gruesome condition, mould prevailing to such a degree that much of the writing was quite illegible. The gall, too, was perfectly unrecognisable, and we cannot even hazard a guess as to its character. Do not pack anything in future until quite dry, or mould will be the inevitable result.

P. P. DARLING.—The cocoons from the hawthorn are those of one of the large Saw-flies—*Trichiosoma lucorum*; those from the grass stems belong to the Drinker Moth (*Odonestis potatoria*).

F. S. WELLS.—1. The small white objects on the egg-shell you send are the eggs of some moth—rather a queer situation for them. 2 and 3. No.

A LANCASHIRE LAD.—1. You packed your birds' eggs so badly that they were all detached from the card and broken to fragments. As far as we can see there were two of the common sparrow and one of the tree pipit; the others we cannot even attempt to name. If you send to us again, wrap each carefully in cotton wool, and do not fasten them to cards at all. 2. We do not know of any other poison which would answer the same purpose.

TEREDO.—The "flesh-worms" in your nose are a remarkable variety of spider! With the point of a needle work round the little dark spot. You can then squeeze them out by the two thumb-nails.

T. H.—"Scissiparity" means increasing by division, as if cut.

W. B. S. asks the "way to kill moths for setting without putting a pin through their heads." Our answer is—you should never put a pin through a moth's head, be it dead or alive. Most moths can be killed instantly by a sharp pinch under the thorax, just where the legs unite. Large moths can be killed by putting them into a tightly-closed box or bottle in which a few drops of chloroform have been placed. Very young leaves and shoots of laurel will have the same effect, but are apt to wet the wings and spoil them. When the moth is quite dead, pass the pin through the thorax—not the head.

JOHN H. J. and CRNIS.—Of bird books there are Harting's "British Birds," at seven shillings and sixpence; and Montagu's "British Birds," twelve shillings. You can get a list for labelling for sixpence. Apply to Mr. Van Voorst, Paternoster Row.

J. H. JOHNSON.—You can get climbing-irons from almost any bird-stuffer's or natural history shop, or you can have them made by an ordinary blacksmith. They ought not to cost more than a couple of shillings.

CANADA.—Doubtless you have fine days, so have we; but just as our fogs and wet are characteristic, so are your frosts and snow. All the world knows that there are more fine days than wet ones in both countries, but that which is common to both is least worth talking about. Now do you see? The poem on the Tibury episode is by Dr. W. C. Bennett, and will probably appear in "The Lark." Macaulay's "Armada" is far better known.

O. T. C.—The first discovered of the asteroids was Ceres, easy to remember as being the first of the series. It was noticed by Piazzi in 1806. You will find a full list in the "Nautical Almanac"—a list invaluable to those in search of a vessel's name.

CHICH-HANE.—We cannot accept the responsibility of advising you. Your best plan would be to get one of the numerous guides to the public schools, such as Pascoe's, published by Sampson Low and Co., 188, Fleet Street.

NUMMUS.—A "piece of eight" was worth four shillings and sixpence.

LANTERN.—Either your light is not bright enough, or it is not at the proper angle with regard to the picture, or the lens is not in focus. The fact of the image being visible is proof that you are on the right track, and that only a little alteration is necessary to ensure success. The lantern as described is that used by photographers for copying and enlarging.

W. F. M.—Type is sold at so much per pound. You can get some of the founts you send samples of at Squintani's, Ludgate Circus, or from any typefounder whose name appears in the London Directory.

A. W. D.—You can get transparent transfers from Brodie and Middleton, Long Acre, and other artists' colourmen. You should varnish with transparent varnish or thinned Canada balsam.

PAUL VARGAS.—The smallest vessel that ever went to Australia was a sixteen-ton Cornish lugger—the Mystery. Get a list of books from Norrie and Wilson, Minorities, E.C. About '60, second-hand.

No. 315.—Vol. VII.

School and the World

A STORY OF SCHOOL & CITY LIFE

BY

PAUL BLAKE.

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXIV.

LANG woke the next morning with a headache, the natural result of the previous evening's experience. He came down to breakfast, however, at the usual time; he had to be off early to Burlington Gardens—or elsewhere.

A letter was waiting for him. It was in Soady's hand:—

"DEAR LANG,—I only found out yesterday where you were hanging out. I

went down to the university in the afternoon to see you as you came out, and hear how you had got on—"

Lang stopped reading; here was Nemesis at last. Why had he never inquired when Soady was coming to town? He put the letter down and felt sick.

However, he might as

"The way of transgressors is hard."

well know the worst. He continued reading:

"I must have missed you somehow; for though I waited till every one had gone, you didn't turn up. However, I saw one face I knew—that beggar Fanshawe. I suppose he came down to see you too. I had half a mind to ask him if he had met you, but I refrained; I don't want to renew acquaintance with him. He looks rather going to seed; pimply, spotted like the pard, as the bard says.

"I've got some jolly lodgings, and I'm working up with the Rev. P. King, who's a rattling coach. He's got a brother who works up fellows for Law; it would be awfully jolly if you were to come here too and stay a few months. Garland's here. He's a brick, it's quite like old times.

"You must come and see me at my diggings. I'm working like a nigger, but knock off for two hours every day for my health.

"I can't look you up to-morrow, but the day after I shall be down at Burlington Gardens sure as eggs. Keep your pecker up and you'll pull through.

"Wishing you all sorts of luck,

"I am, yours,

"R. M. SOADY."

Lang looked up at the top of the letter to see where Soady lived. To his utter dismay he saw there was no address there. The unmethodical Soady had omitted that trifling detail. Hitherto all his letters had been written from school; to put his address there was superfluous; now he had got into the habit of omitting it.

Lang was floored. What could he do? That he would have a whole day to consider. The first thing was to make himself scarce. He hurried through his breakfast and ran off, scarcely replying to the good wishes which several of his fellow-boarders were kind enough to express.

He had made up his mind where to go, the Crystal Palace. He had been there once before, and had enjoyed himself immensely. Surely he could manage to pass a tolerable day with so many things to see.

As he went down in the train he thought over Soady's letter. It was an awful nuisance. This time Soady would be sure to station himself where he must see every one as he came out; it would raise his suspicions at once if he failed to turn up this time.

However, as he thought the matter over, he saw a way out of the difficulty. It struck him that if Soady saw Fanshawe a second time it would look queer, and if he should ask him about himself (Lang), Fanshawe might be taken off his guard. The simple way to guard against both these evils was to write to Fanshawe and tell him that Soady was coming down.

This decided, he felt easier in his mind. His headache was gone; the cold, frosty air had driven it away. It was very chilly as he sat in the third-class carriage, but he had several consolations this morning.

With so much travelling about, and with the little expenses he had been led into by Fanshawe, he found it necessary to economise a little, but he had received a letter from home the previous night which had given him considerable pleasure. His mother had sent him a five-pound note, partly as a present, partly

that he might buy a few things in the way of linen which she knew he wanted.

Fanshawe had been bothering him again about the £5 which he was to give him on the news coming of his success at the examination. Of course this was not due for about three weeks, but Fanshawe wanted the money badly, and seemed to think that was a sufficient reason for asking for it.

Lang was anxious to give it him; he hated to feel under this obligation to him. This five-pound note would come in exactly. The couple of pounds which he had besides would purchase enough to make his mother think he had spent a fair proportion of the note on his personal wants, and thus he would get over his difficulties without risk of discovery. He had been considerably exercised in his mind as to where Fanshawe's payment was to come from, and he was now proportionately relieved.

The train reached the Palace whilst he was still cogitating. He got out, but found the place closed. What a nuisance it was! his early journeys seemed fated to end in disappointment. There was nothing for it but another adjournment to an inn till the doors opened.

This time there was no jovial Mr. Bayliss to frighten him by reading the name on his collar. He passed a dismal half-hour by himself, and then found he could enter the wonderful Palace.

For it is a wonderful place, and Lang in a sort of way enjoyed himself. He was alone, and had no fear of being recognised at present, for there were not twenty other people in the place. He wandered about, looking at the various courts, then down to the lower lake, where the models of the enormous monsters of the early ages of the world stand, to frighten children and instruct their elders. By one o'clock he was hungry, and more than that, very lonely. He wished he had a companion of some sort. He had half a mind to try and make the acquaintance of some young fellow, but he was afraid.

In the afternoon there were the Christmas amusements. Lang had not the money to spare for a reserved seat; besides he did not like the idea of sitting where he could be seen by every one, so he took his stand in the crowd behind the barriers. There he could be seen only by those close to him.

The crowd grew thicker, it was too close to be comfortable. However, he did not mind much, and settled down for an afternoon's enjoyment.

But his anticipations were far from being realised. He had not been standing there more than a quarter of an hour, the overture was just over, when he felt a hand in his pocket. He turned sharply round, and distinctly saw his purse in the hand of a man standing near him, though not next to him. He made a leap for the thief, pushing between the crowd; the man was too quick for him, and wriggled himself out of the throng, Lang after him.

"Stop him! he's stolen my purse!" cried Lang. A man put out his hand to seize the thief, who managed, however, to slip out of his reach. But by this time those in the immediate vicinity were aware of the cause of the disturbance, and there was considerable excitement as the man broke away and made down the building, followed by Lang in hot chase.

A few thought the game worth leaving the sight-seeing for, and joined in the hue and cry. Lang was in high excitement. He had not been captain of St. Mary's football team for nothing. He soon caught up the runaway, and with one dexterous trip sent him flying on to the ground. Two or three men helped hold him down, whilst some went for a policeman.

A policeman was already on the way, attracted by the commotion. He looked very pleased as he laid his arm on the man's shoulder. A dozen voices were explaining the case, and every one was asking Lang what he had been robbed of.

"Are you the gentleman, sir?" asked the policeman.

"Yes," said Lang, excitedly; "he put his hand in my pocket and took out my purse; I saw it in his hand."

"Never touched him," said the prisoner.

"Perhaps he's got it on him now," suggested a bystander.

"We'll see that when we get him to the station," said the policeman. "Come along, my man."

The thief seemed to have given up all idea of escape or defence. The fact was that he was a well-known character, and it was not the first time he had been in this very official's grasp.

"Now then, sir," said the policeman to Lang, "if you will kindly come with me."

"What do you want me for?" asked Lang.

"They'll want your name and address, of course, and so on," was the reply.

Lang looked bewildered.

"You will have to prosecute him," explained a bystander. He was a middle-aged, kind-looking gentleman. "Here is my card, I saw the whole affair. I shall be happy to act as a witness if you wish it."

Lang stammered and hesitated. It came across his mind like a flash that he could not prosecute. If he did, every detail must come out in public. Then it would be his turn to explain how it was that he was at the Crystal Palace at three o'clock in the afternoon of one of the examination days.

No, he must give up the idea of prosecution, though he was so incensed at the man that he would have seen him convicted with pleasure.

"I—I don't think I shall prosecute him," he said. "I shan't be in London, I expect. If he will give me my money I will let him go."

"Not prosecute him, sir! Why, he's a well-known customer!" exclaimed the policeman.

"I'm afraid you won't get back your purse unless you do," said the volunteer witness. "You can't have him searched unless you carry the matter further."

"You needn't bother yourself on that head," said the policeman; "he's passed that purse to one of his pals long ago, you may be quite sure."

"I don't care what you do with him," said Lang, in despair; "I shan't do anything more."

He turned away and pushed through the crowd. He was ready to cry.

A minute afterwards he felt a hand on his arm. He turned round and saw the gentleman who had offered to be his witness.

"What do you want?" asked Lang.

"It's a pity you should lose all chance of getting back your money," said the

stranger; "besides, the man is a known thief and ought to be convicted. Do you want to hide your name? Is that why you won't prosecute?"

"Yes," said Lang, hesitatingly.

"I thought so. Well, you can use my name if you like, and my address."

"It's no good, it would be sure to come out."

"You won't?"

"No, thanks all the same."

"There's only one chance of your getting your money back, then. Tell that fellow that if he will give up your purse you won't prosecute him, but that if he doesn't you will."

There was hope in that. Lang stepped quickly back to the place where the policeman had been standing with his prisoner. Both were gone, and the crowd had melted away.

"It's all U P," said the stranger. "I'm afraid I can't do any more for you."

"No, thanks," said Lang, turning away disconsolately.

The stranger had been kind in intention, whatever may have been the morality of his advice, but Lang was in such a state of depression and unhappiness that he scarcely thought of thanking him. He was anxious to get away from the man who had divined his position. What an irony there was in the stranger's offer to lend him another name! Why already he was supposed to be under another personality than his own.

All desire to amuse himself was now gone. He was in a miserable fix. The five-pound note that was gone for ever he had intended giving Fanshawe as an instalment towards the £10 he owed him.

Where should he get the money from now? His father had refused to let him go into rooms and allow him so much a month; he had announced his intention of paying himself for his board and lodging and tutor's fees, leaving Lang nothing

to defray but minor details, for which he would allow him a small amount of pocket-money. Out of this meagre allowance it would take months to put away five pounds.

And all this had come on him because he was in a false position. He could not prosecute the thief who had stolen his money because he himself was a thief, stealing a certificate of knowledge which he had not earned.

People do not always find at first that the way of wickedness is hard. Fanshawe, for instance, had no scruples of conscience, and went on his way without a thought of his wrongdoing. Lang had a better nature; his conscience was not yet seared, and every wrong action he committed gave him pain. He thought himself miserable and envied Fanshawe, not knowing that to find the way of evil full of thorns is the happiest fate that can befall an evildoer.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XV.—A PLOT.

IN another week the expedition arrived in a country which in no way resembled that they had traversed since leaving Griqualand. They were nearing the mountain chain to which Matakai had fled. The approach to the highlands whence the numerous watercourses flowed down to the Limpopo was signalled by a flora and fauna differing entirely from those of the plain.

One of the first of these valleys was reached about sunset. A river so limpid that they could see down to its bed flowed through meadows of emerald green. Fruit-trees with varied foliage clothed the slopes of the hills which circled round it. The plain in the centre lay bathed in the sunshine, and beneath the shadows of the huge baobabs grazed herds of red antelopes, zebras, and buffaloes. A little farther off a white rhinoceros crossed the open and slowly moved towards the river, snorting with joy at the thought of rolling his mass of flesh in the cooling stream. An onager was braying, and a troop of monkeys were chasing each other among the trees.

Cyprien and his two companions stopped on the top of the hill to contemplate the unaccustomed scene. At last they had reached the virgin country, where the wild beast, still the undisputed master of the soil, lived on in happiness, without a suspicion of danger. It was not so much the number of the animals that surprised the engineer as the wonderful variety. It seemed like a diagram in which the painter had depicted each principal type of the animal kingdom.

Of other inhabitants there were few. The Kaffirs could not but be well scattered in a district of such extent. Cyprien felt that his artistic and scientific instincts were fully satisfied, and allowed himself to think that he had been transported into the prehistoric age of the megatherium.

"It only wants a mammoth or two to

make the scene complete!" he exclaimed.

And immediately Li extended his arm and pointed to several grey masses in

A White Rhinoceros.

the distance. From afar they looked like rocks in their motionlessness and colour. They were a troop of elephants.

on the elbow. He opened his eyes. Pantalacci was seated by his side.

"I could not sleep, and I thought I

only be two of us then to follow Matak and his diamond, and between us we might—"

The two men remained silent, gazing into the fire, each thinking out the dastardly idea.

"Yes," said the Neapolitan; "two can understand each other, but three cannot."

Again there was silence.

Suddenly Pantalacci lifted his head and gazed into the darkness around him.

"Did you see anything?" asked he, in a whisper. "I thought I saw a shadow behind that baobab."

Hilton looked in the direction indicated, but noticed nothing suspicious.

"There is nothing there," he said, "only the linen the Chinaman has put out to bleach."

Soon the conversation was resumed between the conspirators, but in a whisper.

"I can draw the cartridges out of his gun without his knowing it," said Pantalacci, "and when we ride up to the elephant I can fire behind him so as to attract the brute's attention that way, and then it would not take long!"

Hilton feebly objected.

"It may not be so easy as you think."

"Bah!" replied the Italian. "Leave me alone, and you will see."

An hour later, when Pantalacci resumed his place among the sleepers, he lighted a match to assure himself that no one had moved. All was well. Cyprien, Bardik, and the Chinaman were sound asleep.

At least they seemed to be. But if the Italian had been a little more artful, he might have suspected a certain artificiality about the energetic snoring of the Chinese.

At daybreak all were afoot. Pantalacci took advantage of Cyprien's bathing in the river to extract the cartridges from the gun. It took him but twenty seconds to do this. He was alone; Bardik was making the coffee, and Li was collecting the clothes he had put out to bleach on the famous line he had stretched between a couple of baobabs. Assuredly no one had seen him.

The coffee having been finished, the party went off on horseback and left Bardik in charge of the camp. Li had asked to accompany the hunters, and armed himself with his master's knife.

In less than half an hour they reached the spot where the evening before they had seen the elephants. But now they had to go farther on, out into the open between the foot of the mountain and the right bank of the river, before they came up with them.

In the clear fresh atmosphere illuminated by the rising sun, on the wide stretch of verdant carpet, wet with the morning dew, a group of elephants, two or three hundred in number, were busy breakfasting. The youngsters were playing round their mothers. The old ones, with heads to the ground, swinging their trunks as they strolled along, were quietly feeding on the thick grass of the meadow. Nearly all were flapping their huge ears as if they were cloaks of leather, fanning from side to side like Indian punkahs.

There was in all this calm domestic happiness something so sacred that Cyprien was profoundly moved, and asked his companions to abandon their projected massacre.

"With one sweep of the hunting knife."

The plain was dotted with them for a space of several miles.

"You know something about elephants?" asked Cyprien of the Chinaman when they were halting for the night.

Li blinked his little oblique eyes.

"I lived a couple of years in Ceylon as hunter's help," said he, with the marked reserve he maintained as to all that concerned his biography.

"If we could only bring down one or two!" exclaimed Hilton. "It is excellent sport."

"And the game is worth the powder," added Pantalacci. "The tusks are excellent booty, and we might easily carry three or four dozen behind the waggon. We might pay the costs of the expedition out of them."

"That is an idea, and a good one," exclaimed Hilton. "Why should we not have a try to-morrow before we start?"

The question was discussed, and it was decided that they would strike the camp at daylight, and try their fortune in the valley in which they had seen the elephants.

As soon as supper was over they all retired under the tilt of the waggon with the exception of Hilton, whose turn it was to keep watch. He had been alone about two hours, and was beginning to nod when he felt a light touch

would keep you company," said the Neapolitan.

"It is very kind of you, but I could do with a few hours' sleep," answered Hilton, stretching his arms. "If you like we can arrange matters. I will take your place under the tilt, and you can stay here."

"No, stop here. I have something to tell you," answered Pantalacci, in a low voice.

He cast a glance around to see that they were alone, and continued,

"Have you ever hunted an elephant?"

"Yes," answered Hilton, "twice before."

"Well, you know it is a very dangerous business. The elephant is so ready and so well armed. A man does not always get the best of it against him."

"You speak of the clumsy men," said Hilton. "With a good gun and explosive bullets there is little to fear."

"So I should think," replied the Italian. "But there are such things as accidents. Suppose one was to happen to the Frenchman to-morrow; it would be a sad blow to science!"

"A great misfortune!" said Hilton, with a laugh.

"But for us the misfortune would not be so great," continued Pantalacci, encouraged by the laugh. "There would

"What is the good of killing the in-offensive creatures?" he said. "Better leave them in peace."

But the proposition was not to the taste of Pantalacci. "What is the good?" he asked, with a grin. "The good is to fill our purses, to get a few hundred-weights of ivory! Are you afraid of those big fellows, Mr. Cyprien?"

Cyprien shrugged his shoulders, and took no further notice of the impertinence. As he saw the Neapolitan and his companion continue their advance towards the clearing he went with them.

And now they were within a couple of hundred yards of the elephants. If with their fine sense of hearing the victims had not noticed their approach it was because the wind blew towards the hunters, who were advancing through a thick clump of baobab-trees.

However, one of the elephants began to show signs of disquietude, and raised his trunk interrogatively.

"Now is the time," said Pantalacci, in a whisper. "If we are to do any good we had better scatter; let each take his own position, and we will fire together at an agreed signal, for at the first shot the whole troop will take to flight."

The advice was adopted. Hilton moved off to the right, Pantalacci to the left, and Cyprien remained in the centre. Then the march towards the clearing was silently resumed.

At this moment Cyprien was much surprised to find himself grasped in somebody's arms and to hear the voice of the Chinaman.

"I have just jumped up behind you. Say nothing. You will soon see why."

He had then reached the edge of the underwood and found himself about thirty yards from the elephants. Already he lifted his gun to be ready for what might happen. As he did so, the Chinaman whispered,

"Your gun is not loaded! Never mind. It's all right! all right!"

At the same instant there came the sound of a whistle—the signal of the attack—and immediately a gun, only one gun, was fired behind Cyprien.

Turning quickly, Cyprien saw Pantalacci gliding behind a tree. But at the instant his attention was called off in front of him.

One of the elephants had been hit, and, infuriated by his wound, came charging towards him. The others, as the Neapolitan had foretold, were off in flight in a terrible stampede that shook the ground for a mile or more.

"All right!" said Li, clutching tight to Cyprien. "When he comes closer jump Templar aside. Then turn round that bush, and cut, with the elephant after you. I will look after him!"

Cyprien mechanically obeyed the orders. He had barely time to do so. With trunk erect, eyes shot with blood, mouth open, and tusks at the charge, on came the elephant with fearful speed.

Templar behaved like an old campaigner. Obeying the pressure of the rider's knee, he executed a violent swerve to the right, and the elephant shot past without touching him, straight across the spot the horse that moment had left.

Without a word the Chinaman slipped to the ground and leapt behind the bush he had shown his master.

"Here! here! Turn round the bush! Let him follow you!" he shouted.

The elephant rushed back more furious than ever from having failed in his first attack. Cyprien, though he did not understand Li's manœuvre, executed it most carefully. He galloped round the bush followed by the panting elephant, and twice foiled his attack by a sudden swerve. But would the manœuvre succeed in the long run? Did Li hope to tire out the animal?

This did Cyprien ask himself without being able to reply, when suddenly, to his great surprise, the elephant fell on his knees.

Li, with incomparable address, had

And saying so he shouldered his gun and fired.

At the same instant the explosion of the bullet was heard in the body of the elephant. Then came a last convulsion. Then he remained motionless as if he were a piece of grey rock.

"All over!" exclaimed Hilton, riding close up to the animal to get a better view of him.

"Wait! wait!" said the Chinaman, with a look.

They had not long to wait.

As soon as Hilton reached the elephant he stood up in his stirrups, and in deri-

"Brought it down on the hunter."

seized on the propitious moment, glided from the bush up to the very feet of the pursuer, and with one sweep of the hunting knife had cut the heel tendon which in man is called the Achilles.

Such is the usual practice of the Indian huntsmen, and the Chinaman, thanks to his experience in Ceylon, had been able to deal the stroke with marvellous coolness and precision.

Fallen and helpless the elephant remained without a movement, with his head laid down among the grass. A stream of blood flowed from his wound, and with it his strength flowed away.

"Hurrah! Bravo!" exclaimed Pantalacci and Hilton, appearing on the scene.

"We must finish him with a shot in the eye," said Hilton, who seemed to feel an irresistible desire to take some active part in the drama.

sion tried to lift one of the enormous ears. But the animal by a sudden movement, hurled aloft his trunk, and with one mighty blow brought it down on the hunter, smashing his backbone and crushing his head before the affrighted witnesses of the horrible scene could snatch him away.

Hilton uttered but one sharp cry of pain.

In three seconds he was but a mangled mass of flesh, on which the elephant had fallen never to rise again.

"I was sure he would kill him!" said the Chinaman, shaking his head. "Elephants never fail when they get a chance."

Such was the funeral oration on James Hilton. The young engineer thought of the treason of which he was to have been the victim, and could not help recognis-

ing in the death a just punishment for the share in the plot to deliver him over defenceless to the fury of the angry beast.

Whatever were the thoughts of the Neapolitan, he deemed it best to say nothing.

The Chinaman was already digging down into the grass of the prairie, and,

with the aid of a knife, scooping out the grave in which, with Cyprien's aid, the corpse was placed. All this took some time, and the sun was high above the horizon when the three hunters returned to the camp.

When they reached it Bardik had disappeared.

(To be continued.)

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy-Earl," etc.

CHAPTER VIII.—(continued.)

TOILSOMELY the days passed on, Tenterton fretting himself ill as his physical sufferings subsided. Each day was a repetition of its predecessor, until at last the time came for departure from the country and the entrance into life in Moscow.

Tenterton was a very young man—a boy, in fact—not yet twenty, and he had many of the faults of youth. He was not methodical. His papers were in considerable disorder. Indeed, since he had flung them into the top part of his portmanteau he had not thought of arranging them. There was a sort of cover or partition to this part of the portmanteau, which strapped down, intended to secure linen and lighter articles of dress, such as gloves, neckties, etc. But Tenterton devoted this division of the box to books and papers, keeping his linen, clothes, and smaller matters in what would be called the bottom. He now, without undoing his papers or changing their order (or disorder), packed such clothes as were to be packed in this lower compartment. Besides this he had a sort of travelling-bag, which contained toilet requisites and linen. A small leathern writing-case carried loose in the hand, a plaid, a macintosh, an umbrella, and a thick railway-rug completed his baggage.

The hour of starting was to be five o'clock in the morning of the following day, and doctor and patient were sitting after dinner, the former smoking and the latter busied as usual in thought,

when a tarantass drove up, from which there jumped one of the servants of Madame Abrazoff, who, cap in hand, and beaming with exaggerated smiles, ascended the wooden steps of the verandah. It was a chilly afternoon, so that the servant had to knock at the closed door for admittance.

"Come in," said the doctor.

"Thank you, barin," said Trifon, who was dressed in the high boots, wide trousers, red calico shirt, and skirted coat without sleeves which we have already described. "Our lady told me to give this letter to Edward Tintee-teen. The young barin, I think. There is the letter. Oh yes! I brought it all right. Madame Abrazoff knows whom to send and whom to trust. Clever lady she is! Cold evening, though, gentlemen, specially riding!"

"All right, Trifon! Take some *vodka*. Capital stuff this!" said the doctor. "Better than what you get at the cabak, isn't it?"

Trifon tossed off his glass and held it out for some more, which was immediately supplied. Tenterton busied himself with the letter. At last he exclaimed,

"Well! she is a brick, whatever her husband is!"

This being in English was too idiomatic for Strammeller to understand, so the younger man read it out to his friend. The letter was as follows:

DEAR MR. TENTERTON,—When I reflect that the amount of suffering you have recently undergone has resulted from your

readiness to serve me and mine, I feel how impossible it is for me to do more than thank you, and how inadequate my thanks are to express my real sense of your admirable conduct. You will therefore, I am sure, not feel hurt by the enclosed trifle, which merely represents the pecuniary arrangement entered into regarding the time you agreed to bestow upon my son, and which he was prevented from availing himself of. I regret that my own establishment in Moscow is too small to permit of my offering you rooms there during your stay, but my husband has promised me to have a suite furnished for you in the same house as that occupied by Dr. Strammeller, and on the same flat. This will be yours whenever you like to use it. I regret that the course of study at the First Gymnasium prevents my son from continuing his English studies during term time, but the enclosed letter to Count Schaafstadt, at the Kremlin, will secure you an entrance into the best society of Moscow, and in the Count's own family you will find some of the most interesting pupils possible.

My carriage will be at your service tomorrow, and the bearer of this has orders to take care of your luggage and secure your tickets at the station, so that you will have no trouble whatever. Hoping to see you soon in Moscow, and with every good wish,

I remain, yours ever gratefully,

EKATERINA ABRAZOFF.

Kind and grateful as this letter was, it seemed to be anything but consolatory to Tenterton. He read it twice over, then clutched it in his hand and stuffed it into his pocket. In doing this he never noticed the packet of bank notes which fell on the floor as he rose and paced up and down the room. Strammeller, however, saw the packet, stooped and picked it up, and gave it to Tenterton, saying,

"Now I know why you English are all so unpardonably rich; you despise fortune and she seeks you."

"It is very embarrassing," said Tenterton. "This lady sends me a lot of money which I have not earned, and offers me a host of favours which I do not feel at liberty to accept, and yet they are offered so prettily that it seems difficult to decline them."

"Difficult! I should say so! The proper word to use about declining them is just *impossible*, not difficult. Who can ever understand an Englishman? Hot and cold with one breath. Never knowing what to do, but generally blundering into the right path by mistake. Seldom doing wrong intentionally, but always offending everybody by morally treading on their softest corns. When I have cured your bodily infirmities I shall make a vow to have nothing more to say to you!"

The light manner in which the doctor viewed Tenterton's difficulty did not tend to comfort the young man. He was yearning for advice and for strength to pursue the path towards which duty pointed. Strammeller was a man of the world, whose ideas and opinions were bounded by the horizon of physical science; he had not been led to look beyond. In him, therefore, Tenterton could not seek for the sympathy he needed.

As soon as he could get to his own room he shut the door, and, flinging himself upon his knees, sought that peace which the world cannot give, and which men of the world never know. He arose refreshed and strengthened, and as Trifon had not yet left to return, he determined on sending a letter by him.

enclosing so much of the money as seemed overpay. He went to the common sitting-room, which he found deserted, the doctor being engaged in packing. He sat down and wrote as follows:

DEAR MADAM,—Your extremely kind letter has just been placed in my hands by Trifon. I take up my pen to acknowledge your goodness, but find the task beyond me. I have no words to thank you. But however flattering your appreciation of the slight service which I have been enabled to render you may be to my vanity, I cannot allow your overestimate of that service to lead you into unjust because too liberal remuneration. I am more than repaid by the conviction of having gained your goodwill and esteem, and shall thankfully avail myself of your hospitality at Moscow for a few days until I can conclude arrangements with the Count whose acquaintance I am about to owe to your kind offices. But I cannot take advantage of your generous feeling on the subject and allow you to place a sum of money at my disposal so greatly in excess of the terms agreed upon between me and Mr. Abrazoff. As you may not be aware of these terms, I will, to avoid misunderstanding, mention to you that I agreed to devote a month to the care of your son, Mr. Paul Abrazoff, for one hundred roubles. It is true that I have been detained over a month, but that does not entitle me to receive the five hundred roubles which you enclose. You will pardon me, I hope, if I propose retaining the hundred roubles to which by the terms of the agreement I may be entitled, although I have not done the work, and as the second month has been broken in upon I will add to the hundred roubles fifty as the half of the month just entered upon. This will be much more liberal pay than I have any right to accept.

With renewed expressions of grateful appreciation of your generosity and kindness,

I remain, dear Madam,

Yours most faithfully,

EDWARD TENTERTON.

This missive he placed in an envelope, and the notes for three hundred and fifty roubles which he desired to return in another envelope of the same size. He then enclosed the two in one of larger dimensions, which latter he sealed and addressed to Madame Abrazoff. He then called Trifon and quite won his heart by giving him three roubles for *natchai* (tea).^{*} He begged him to hasten back and be sure to place the packet in the hands of his mistress without delay.

As they were to start very early next morning, the doctor made Tenterton get to bed long before the usual hour, and although he was restless and excited he was soon asleep. In Russia life begins early to the workers, and the men who polish the floors and lay the wood in the enormous stoves frequently commence work at four o'clock in the morning. After them come the housemaids, to arrange ornaments and so forth, and finally the lackeys appear with materials for breakfast; so that a man need never be too late for his train for want of calling. Even where few servants are kept the *dvornik*, or yard-man, is supposed to be up all night, there being in all houses a relief kept, so that when one sleeps another is on duty.

At the appointed time, therefore, everything was ready. The telegga, or cart, with the luggage, started at three o'clock in the morning, and at four the

carriage bells were jingling and jangling before the door. Trifon was on the box, with a letter for Tenterton, which he read as follows:

DEAR MR. TENTERTON,—I have received your long letter, and the three hundred and fifty roubles returned. I think you are wrong, but of course you must act as you think best. Wishing you a pleasant journey and all prosperity at its close, I remain, yours truly,

EKATERINA ABRAZOFF.

Tenterton was gloomy and Strammeller serious. Each seemed to feel that a pleasant holiday was over and a black Monday beginning. The English youth was quite depressed, and after a time the doctor noticed it, saying,

"You want *tone*. I shall give you quinine when we get to Moscow—but perhaps it is the influence of this chilly weather. Autumn is always gloomy, and I suppose you have so many suicides in England on account of the perpetual autumn there."

"Yes," said Tenterton. "I am rather seedy, but the cause of the depression is not physical but mental. You have made superhuman efforts to secure my bodily health, but I am very much troubled in my mind. I am, in fact, torn to pieces with anxiety, and that in a matter which I have no right, at present, to confide to any one, although greatly needing advice."

"Bad sign that!" observed the doctor. "Digestion out of order, or perhaps the liver affected. In that case quinine is dangerous—you must have a course of mineral waters at Moscow. There is a first-rate manufacturer there whom we must patronise. I am bound to pull you through!"

They soon reached the station, where they found the cart with their luggage awaiting them, and, to the great surprise of Tenterton and the doctor, Madame Abrazoff, her daughter, all the governesses, the maids who usually travelled with them, the butler, and the Moscow man. They had brought an amount of luggage with them that filled the little station to overflowing, and in his anxiety the station-master had telegraphed to the next station, which was an intermediate depôt, to be sure that there was accommodation for the party, or else to put on an extra carriage.

The surprise was great, but Tenterton seemed far from pleased. The doctor was quite taken aback. Madame Abrazoff explained her unexpected journey by saying that she had been telegraphed for by her husband to Moscow in all haste, and with only a few hours' notice she had left Madame Narishkin, and was on her way to join her husband.

In due time the train arrived, and a commodious first-class saloon car received Madame Abrazoff, our two friends, the governesses, and Thérèse, madame's particular maid. The other servants were bestowed in second and third class carriages, according to their position in the household. The luggage was placed in vans, save Tenterton's portmanteau, which the guard placed in the carriage with him at his particular request.

Merrily flew the train along the well-made line, and Tenterton was rejoicing in the feeling of health and vigour which he felt. He was just moving his portmanteau to a more commodious position, when a terrific jerk threw the

whole party from their seats. A series of heartrending shrieks pierced the air, and the hinder part of the train was urged by the speed it had attained on to the front carriages, which had been arrested by some obstacle placed on the rails. There are no side doors in these carriages. You enter from the back or front, and walk through from one compartment to another and from one carriage to another. The carriage is more like a tramcar than ours are. The seats are not arranged as in a tramcar, but as in a Pullman car, transversely to the length.

(To be continued.)

THE BIG BELL.

When winter nips one's ears and nose,
When water's scarce,
for "taps is froze"
(As John remarks),
then who can tell
How we detest that
clanging bell?

How warm the bed!
how nice and snug

To lie beneath an extra rug!

I should enjoy another turn!

That bell! oh, hang the old concern!

(N.B.—It is hung.)

Hark! yes, there goes the second chime;
We're fifteen minutes after time;
There's no mistake, we've done it now,
And won't there be a jolly row!

* * * * *

There was. Each sought his cold, hard
seat

With fearful heart and laggard feet,
To find inscribed upon his slate,
"Write fifty lines for being late."

PAUL BLAKE.

DEATH DOTS.

There are few sadder sights to be examined by humanitarian eyes than the dotted wreck map called the "Wreck Chart of the British Isles for 1882-83," which is compiled for the Board of Trade Register, and is published in the current number of the "Life Boat Journal." There are 3,654 of these dark spots surrounding the coast-line of the British Isles, and massed, especially on the east coast, in dreadful clusters. As far as can be ascertained, in spite of the rescue of many precious lives by life-boats and rockets (which saved 450 persons), 1,020 human beings were lost. It is satisfactory to know that there is some decrease in the loss of life, which amounted to 77 cases less than in the preceding year. In one generation, *i.e.*, since the year 1854, there have been no less than 62,730 wrecks on our own shores, with the loss of 21,651 lives. Whenever we hear the wind howling, we feel grateful for the two "Boy's Own" Lifeboats, the one at Poole and the other at Looe, that our readers enabled us to place on our dangerous coasts.

* All gratuities to servants and workpeople in Russia are said to be for tea (*na tchai*).

WITH THE INDIANS OF THE NORTH-WEST.

BY THE MARQUIS OF LORNE.

PART II.

Carvings by British Columbian Indians.

AFTER the Sioux, the most interesting people now left, and still retaining much of their aboriginal traits and customs, are the Blackfeet. Their braves say that their first ancestor received from the morning star, their war god, a magic ointment, wherewith if he anointed his feet, he would be endowed with such swiftness that the antelopes would flee in vain before him. There are many stalwart men amongst these people, and it was most interesting to observe them in the great councils held with them by the Governor-General in 1881. They were under the leadership of a chief named Crowfoot. He maintained good discipline among his people, listened attentively to the suggestions made to him to encourage them in agriculture, and while he complained that his allowance was not sufficient he always advised his tribes to remain friendly to the white man.

The Indians came to the appointed place of meeting mounted, and in full battle array, firing their Winchester repeating rifles in the air, and shouting and waving their weapons. Behind them tripped in gay colours the women, bringing their children, for the children could not be left in camp, and the women must see what their lords and masters were after in their conference with the white chief. Arrived close to the tent where I awaited them, they sprang from their horses, and advanced to shake hands, which ceremony was performed by the chiefs and head men; these then sat down in front of me, the chiefs in the front row, the head men behind, and ranged around in a deep half-circle was the rest of the tribe, on the right an allied set of cousins, with their aunts and sisters behind them; while on the left, in triple ranks, crouched on the ground, sat the warriors, round-limbed and lithe young fellows, clad with little but paint on the body, and with long warlocks, braided with brass, depending from their temples; the rest of their hair—after being gathered up upon the crown, so that if an enemy wanted to have a good tug at the scalp he could do so without trouble—

being allowed to fall in long dark masses over their shoulders.

From the flank of the line of braves, round in front to the right, stretched the ruck of the tribe and the women and children. A good deal of quiet sitting and smoking was indulged in before a word was spoken, and then it was always necessary to look on at a dance for some time longer before business was opened up, for nothing could be done until the pipe had been smoked and a dance had been performed. Strange and weird and uncouth these dances are; the magicians sit on the ground beating a tom-tom, and in a circle, following each other in single file, strut, bow, howl, and jig the braves detailed for the duty; pretending occasionally to be in pursuit or in flight, round and round they go until the music ceases, when all sit upon the ground. Sometimes the young men would insist on recounting their deeds in war, boasting of stealing cattle and of killing their foe. When by these processes the chiefs have sufficiently gathered together their thoughts to be able to detail their desires, each man rises in succession, and speaks, while the interpreter stands listening, and at intervals turns to the white chief, and tells him in substance the eloquent and fervid harangue to which all are listening. Usually, amid much flowery rhetoric, the speech resolves itself into a demand for more favours, and is, in short, nothing but an exclamatory beggar's oration.

Often the interpreters will not take the trouble to render all the flowery language, although they themselves are half-breeds. On one occasion, after much eloquence had been exercised, and the interpreters had said nothing, it was asked, "Why do you not interpret?—what does he say?" All the translation vouchsafed was—"Oh! he say grub!" The pleading for this very necessary article was backed by the certainly very cogent argument that the coming of the white man had taken from them their land, or rather, what they valued upon their land, that is to say, their great game, the buffalo; each year

the white man's presence had marked a decrease in the buffalo; and what was the Indian without the buffalo? how could he get skins for himself, for his house? how procure food or sinews to sew the clothing together? how live without his beloved buffalo?

The argument would certainly hold good, for although it is the improvement in the weapons of the chase, and the introduction of fire-arms, which has mainly contributed to diminish the numbers of the buffalo, yet the very introduction of these fire-arms was due to the coming of the stranger. And what does the white man give in return for the evil thus inflicted? He gives five dollars for every man, woman, and child in the tribe every year to the chief, to be apportioned for the good of his nation; he gives, also, when he is obliged to do so, a ration of flour; and he gives above all, and every year to an increasing degree, that knowledge of husbandry which can alone save the red race. Already, in 1881, although these Blackfeet had but lately been engaged in hunting parties, some effect could be produced upon them by speaking of the advantages of potato growing. After haranguing them upon the subject, the chief warrior rose when the council had finished, and grasping my hand, and putting round my arm the bridle-cord of his horse, he asked me to accept the animal as a present (which of course could not be accepted), and repeatedly assured me that, although he had hitherto been the first in fighting, he would now be the first in working. I am sorry to say he did not seem very much pleased when he afterwards received a fowling-piece instead of a rifle for a present; but the latter would have been of no use to him for duck shooting; and I hear that he has kept his promise, and has cultivated his own potato patch this year.

There is another great and scattered people, the Crees, and yet another with a stranger name, dwellers in the rocky country on this side of Winnipeg, who call themselves the Ojibbeways. Differing in origin and language, the red men fought constantly against

each other, and these wars, and the epidemic diseases to which, as they averred, they had become subject after contact with the whites, made them less numerous than the enormous extent of country over which they hunted would lead us to suppose. It is, however, only when the savage cultivates in some measure the ground that he can greatly multiply. Champlain and Frontenac found the Indians of the St. Lawrence growing corn. There is no evidence that the wild horsemen of the plains ate of any plant sown by their hands. In warfare they employed some methods of defence and communication which show that recent European army regulations enjoin practices long known to Sioux and Blackfeet. Thus, pits, whence the archers could discharge their arrows, are seen within the lines of old entrenchments, and when the Canadian mounted constabulary regiment

of each spigot of wood, run up round a central pole. Then the drums and tom-toms beat, and while all stand admiring their courage, one youthful warrior after another tries to

and in making poultices from various trees and shrubs, whose healing properties are well known to science. Thus from the bark of a certain species of willow a preparation can

Indian Graves.

first entered the "Lone Land," they found that their movements were signalled to the tribes by a very good "heliograph" system of "flashes." No such signalling was at that time known in our armies, and the troopers, as they rode along over the vast grass-covered plains, wondered what the twinkling points on the horizon could mean.

Amongst all these tribes the custom, formerly universal, still obtains to have a great annual feast called the Sun Dance. This is the occasion appointed when the young men may show of what mettle they are made, by undergoing a voluntary torture. The medicine man, the sage, herbalist, doctor, and mystery man, stands in a great circular tent made of boughs or skins. Fantastically adorned with head-gear, and painted with streaks of orange, crimson, or blue, he holds in his hand a sharp knife, and when he is about to perform the final ceremony, the victims have already fasted for many hours. They come one after another and stand before him, and on the chest of each he makes four cuts, so as to divide the flesh into two bands. In the bleeding wounds he places two long spigots of wood, lifting the muscles so as to pass these through the incisions of the flesh. He then attaches cords and ropes to each end

break away from the attached cords. The muscles start and strain, and the flesh is extended far from the chest; the wounds gape, and the sight becomes horrible, for the agony is dreadful. Still the wild dancing or hanging on the cords goes on, until the man falls exhausted, but free. It is almost inconceivable how much can be endured by these young men in their efforts to prove themselves worthy, in the eyes of the women and others of their tribe, of the manhood which gives important privileges belonging to him who has shown himself bravest in the camp of the savage. Buffalo heads, guns, and other heavy objects are dragged about attached in the same horrible manner, while it used to be considered a proof that the man would be the best at stealing horses who tied himself by the shoulder-blade to the bridle of a horse, whose every motion, as it stooped to feed, brought a fresh pang of pain. But enough of these terrible rites: they still continue, but the number who undergo the torture is diminishing year by year, and we may trust to the Gospel and to missionary efforts to put an entire stop to them before long.

Much is said of the knowledge of simples possessed by the squaws. It is certain that they are very clever in producing decoctions

be made which staunches hemorrhage, and quickly heals the wound. Strange tales were told us of the efficacy of some of their medicines.

The natives are very fond of a sweating bath. A little arbour of inwoven branches is formed. Heated stones are placed inside, and the Indian crouched over them is wrapped in the steam arising from water thrown on to the hot stones. After getting into a thorough perspiration, the patient (for this treatment is often practised in cases of illness) will run out and plunge into cold water, thus following the custom of other nations besides his own, for Russians and Turks are equally fond of such refreshment.

It is indeed fortunate for us that we have followed the good example set us by the Hudson's Bay Company's servants, and have invariably kept faith with the aborigines in all our dealings. "Honesty is the best policy"—an old truth proved afresh in the North-West. The Americans have never been fortunate in their relations with the poor savages, and many a bloody scene has in consequence been enacted. We have a band of Sioux near Battleford, in Saskatchewan Province, which is a remnant of those who killed one thousand five hundred white

people in 1863 in Minnesota. An agent had, as they believed, robbed them, and they fell upon the white population around them, slaughtering all. A woman was pointed out to us as one who had the reputation, whether well founded or not, of having roasted nine American babies alive! It was impossible to substantiate the statement, for she naturally disliked to talk upon the subject; but there is no doubt that in all the feuds the Americans have had with the Indians it has always been found that the women participated in the work of slaughter. The man who pointed the woman out to me had himself escaped wounded from the massacre, after seeing his mother, sister, and others of his family shot down. I had held a council that day with a large number of redskins, and I asked him if at the time of his misfortune the whites had received any warning; his answer was, "No, they had been as friendly with us that day, to all seeming, as were your Indians here to-day." The cause of the outbreak was ascribed by him to the dishonesty of the agent appointed by the American Government, whom he accused of having perverted the goods sent for the Sioux to his own use. "If the agent had been killed, it would not have so much mattered," he said; "but they ascribed the fault of one to all, and hence the trouble."

The late President Lincoln, whose memory is revered in England as well as in America, was at that time at the head of the Republic. General Sibley was sent in command of forces in pursuit of the Sioux, and with great skill he drove them before him till he came to a large encampment where they were strongly posted. Pretending then that he hesitated, he waited with his force until, lulled into false security, the Sioux allowed themselves to be surprised, when the names of a great number were sent up to the President to receive their death sentence. It was a remarkable proof of the justice and clemency which signalled the character of Lincoln, that he cut down the number of those sentenced to death, and returned the list, when it was found that the names of those on whom justice was to take its course had been written down in his own hand. It is strange that the scattered remnant of these Sioux, who are still amongst us, bear the reputation of being good Indians, and the name, which was once one of terror, now never excites even a passing emotion of disquiet.

Some horrible cruelties have been practised in our day by Indians in New Mexico and in the American far west on their white prisoners, cruelties that recall the tortures described by the French voyagers, who saw with disgust the treatment to which their

own allies subjected their fallen enemies. Champlain describes how his Indian friends, taking a captive, recited to him all the atrocious things the prisoner's nation had perpetrated against the French allies. They bade the poor man sing if he had the courage to do so, and the victim did manage to sing, but, naturally enough, "it was a song which was sad to hear." "Meanwhile," he continues, "our friends lit a fire, and when it was well aflame, each took a brand and burnt the miserable creature by slow degrees, so as to make him suffer more torment. Sometimes they left him to throw cold water over his back. They then tore out his nails, and put the fire to his hands and feet. After scalping him they poured hot resin upon the head. Then piercing the arms near the clenched hands, they seized the nerves and drew them forth. . . . The poor creature uttered strange cries, but yet suffered with such constancy of courage that sometimes one would have supposed that he felt not the pain." Champlain at last persuaded the fiends to let him kill the already half-dead prisoner by a shot from an arquebuse.

It is horrible enough to recall these nightmares of history. But it was the fate reserved for many a Christian martyr, whose successors in the Church now are the trusted and beloved guides of these Indians' descendants.

The modern redskin baby is treated much like a bundle of clothes. Swathed tightly in skins or other clothing, it looks perfectly happy with its brown bead-like eyes, but perfectly helpless. It is strapped down on a board, as seen in the engraving on page 252, which does not make the mother as happy-looking as she ought to look with such a prosperous and sleepy infant on her back. At the head of the papoose's board cradle is an upright arched piece of wood, from the centre of which usually hangs some toy to keep the child amused. An Indian's "lodge" or portable house is often a most comfortable abode.

It does not enter into an Indian's head to suppose that he is intruding if he walks unannounced into your house, and sits down silently staring at you in your sitting-room. Nor does he think you rude if you enter his abode.

Their mode of disposing of the dead is seen in the engraving on page 253, where a corpse is raised on a platform, out of the way of wolves. Sometimes they place the wrapped-up body in a tree. But the manner of sepulture is various. Many tribes bury. None burn the dead.

The few savage tribes which yet remain in

possession of their old customs and manners do not form by any means a prominent feature of even the most unsettled portions of Canada. The talk is not of Indians, but of engines, of the plough, of the self-binder, of the reaper, of the hay-cutter.

People often speak of the difference and inferiority in worth of the Christian Indian as compared with the native, untouched by the influences of the white man. But this is not only a careless but singularly unhappy mode of speech. It is not, it need hardly be said, the conversion of the heathen which has had effects, but the contact with a civilisation which has its debasing as well as its ennobling qualities. Nothing has kept peace among native tribes in their original wild state but the Christianity introduced by the missionaries, who have, isolated and unsupported as they were in old days, yet produced a marked effect wherever they took up their residence. The early French missionaries prepared the way for the agents of the great fur-trading companies. They gave to them the example to treat kindly, considerately, and justly the red man. It is only too true that the fur traders at one time dealt with that worst of poisons, brandy, in exchange for skins; but in the main they followed the advice and precepts of the bringers of the Gospel. Bitter conflicts were thereby avoided, and the foundation laid for the unhindered advance of civilisation.

It is undoubtedly true that the first effects of the advance does no good to the native. Just as his appearance and often his health suffers at the commencement for the change in his lodging and apparel, when instead of the birch-bark or hide tent he takes to bad hovels, and wears, in lieu of his buffalo robe and embroidered "leathers," the cast-off clothing—incongruous and gaudy if he can only procure such—of the European; so at first, in manners and habits he imitates, not the best of the white man's ways, but what he sees the most of, namely the worst. Although Cooper in his novels exaggerated the stateliness and virtues of the red man, yet in the main his picture of him is a true one. Singularly honest, the Indian would not touch the food supply of a friend, although he himself might be almost starving. He spoke the truth, and was true in his friendship, however merciless, cruel, and crafty against his enemies. It is natural that the savage virtue should vanish when brought in contact with the manifold vices of civilisation. The leavening element of that civilisation is the Christianity which may, and does, touch the savage also, so that he becomes in time better, materially and morally, than before.

ABBING'S LITTLE JOKE.

By ASCOTT R. HOPE,

Author of "The Amateur Dominic," "The Telltale," etc.

CHAPTER II.

WHEN Abbing awoke, it appeared that he must have slept for two or three hours. It was quite dark; the gas was lit in the passages; and below all was quiet. The boys would be at tea, or preparing their lessons. Abbing had not had his tea, and for the first time, perhaps, wished that he could be sitting comfortably at his lessons.

His absence was sure to be noticed now, and he would have to account for it sooner or later. If he could only put some clothes on, he felt that he would be at less disadvantage in the reckoning to follow. Anyhow, there was no good in staying hidden up here. So he stole

downstairs to reconnoitre, first wrapping himself in a sheet after a style more classically graceful than convenient for rapid motion. Oh! what a laugh there would be against him if he got caught in this costume.

Once more the fortunes of adventure were unpropitious to him. No sooner had he reached the foot of the stairs than he heard Mrs. Bramble approaching. The matron seemed to pervade the whole house that Saturday evening, as indeed became a good housewife at the end of the week.

Abbing turned and bolted through a spring door shutting off a passage to the

kitchen. He stopped to listen. Mrs. Bramble had heard the noise; she was following him to see who might be trespassing on this forbidden ground. There was no help for him but to fly through another door, opening upon the garden; but he went into the wind and rain, that soon drenched his sheet through.

"What a cold I shall catch!" thought this involuntary hydropathic patient, crouching down behind a dripping bush, as he saw Mrs. Bramble come to the door through which he had just escaped.

"Who's there?" she challenged, peering suspiciously into the darkness. "Puss! puss!"

Abbing held his breath, trying not even to betray himself by a shiver, and she saw nothing of him in his covert. It was too cold, as he calculated, for the old lady to stand there long, so presently she went in, supposing perhaps that she had been mistaken; it must have been a cat she had heard scampering in the passage. But she shut the door, and, to his horror, he heard the key turned in the lock!

Now he had to choose between staying out there all night, or seeking admittance at the cost of—what? Abbing had almost given up the game, and thrown himself on the mercy of Mrs. Bramble, as the most tender-hearted of the fates with whom he must deal. But she was gone before he had made up his mind. Then a ray of hope presented itself. There was a light in the lavatory. Some of the boys would be there. The door of it, communicating with a small courtyard next the garden, was not locked till later, only barred on the inside. The boys would let him in, and if, as he trusted, they were small boys, they would be the less free to laugh at him.

It seemed a chance worth trying. Treading gingerly over the rough gravel walk, Abbing climbed the wall, no pleasant job for his unprotected knees and elbows, and dropped into the courtyard with his drenched drapery clinging and fluttering about him. In this strange guise he approached the door, and knocked, not too loud, for fear of attracting more attention than he bargained for. How the rain pelted down upon him, and how the wind made him shudder, as he stood there in such sorry case! Phillips all this time, no doubt, was cosily seated at his uncle's table, feasting on the good things which Abbing would so gladly have given, if he had them, never to have entered upon such a bad business.

There were some small boys in the lavatory, who soon became aware of a mysterious muffled knocking. Wondering what this might mean at so late an hour, they came with a candle, and challenged through the keyhole, asking who was there; but a squall of the storm without drowned the answer. Then they cautiously opened the door a little way. In rushed a sudden blast, blowing out their candle at once, so that they had only a dim glimpse of a white-robed figure in the darkness.

"A ghost! a ghost!" cried one of them, and they all scuttled off in panic-stricken fright.

Abbing, for his part, afraid that the door would be slammed in his face, had sprung forward, and slipped and fell in a puddle of mud, barking his shins against the step and making his nose bleed. But he got up at once and made good his entrance, to find himself alone in a narrow stone-paved passage leading from the lavatory through the school-room. He hurried on into this large room, which was all dark and silent. In the dining-hall, close at hand, he heard the rattling of spoons and cups, showing the boys to be still at tea; but at once this sound gave place to an indistinct babble of voices, and he understood that the fugitive small fellows had communicated their alarm. In another moment the whole of them would be rushing out this way, and he was not prepared to be so publicly discovered.

Where should he hide himself! His first thought was to dart under one of the long bare tables, but there his white drapery could not fail to betray him, even in the dark. So he made for the fireplace, a huge mediæval chimney-piece, constructed to throw out as little heat as possible in proportion to the size of the fire, round which three or four boys could stand at once beneath the chimney, a favourite nook on cold winter nights. He slipped into this cavern, put his feet on the cold bars and heap of sharp coals, and with a spring hoisted himself up on to a ledge within the capacious opening above. It was not the first time he and other amateur chimney-sweepers had performed this feat of gymnastics.

No sooner was he safely ensconced than the whole troop of boys flocked in with excited uproar, the master at their head, as Abbing knew by his voice, and congratulated himself on being for the nonce out of sight.

"Ghost! Nonsense!" this voice was saying.

"Well, sir, it was something all in white—we all saw it—and it flew at us when we opened the door."

"An owl, I suppose, or a frightened goose, like yourselves!"

With this the tumult rolled away along the passage.

Now that they were all gathered at the door, examining into the supposed mystery, Abbing thought it would be his best chance to slip down and seek some further place of shelter while the coast was clear. He had a notion of appealing to the charity of one of the maids, who would be coming presently to take away the tea-things, and might be induced, not without gigglings and mild scoldings, to hush up his escapade by procuring him some clothes to replace his too light and airy, not to say ludicrous costume, ornamented as it now was with soot and mud as well as water. But before he could nerve himself for this bold step there was a clang of the outside door, and a grating of the key in the lock, and the noisy troop of investigators came pouring back.

"Silly little fellows, you must have been dreaming!" said the master, who seemed to have halted close to the chimney-piece that held Abbing and his evil fortunes. "But, come, how late you are at tea to-night. It is time to begin preparation. Light the gas and take your places."

Then arose a great tumult of scuffling, running, dragging about forms, bumping down on seats, and banging books on tables, gradually subsiding into orderly quiet, so that Abbing could follow the master's measured steps as he paced up and down the room.

The prisoner in the chimney knew his way only too well. He would certainly remain on sentry for half an hour or so, perhaps longer, to see his pupils' noses well on the grindstone, after which he might go away for a time, or might not. For this opportunity Abbing must wait before coming down to appear among his astonished schoolfellows; and, ugh! it was cold dismal work waiting up there in the dark chimney with a damp wind blowing down upon his head. Others better prepared to bear the cold felt it too, as seemed by what one of the older fellows approached the master to say.

"Please, sir, may we have the fire lighted to-night?"

"Fire!" grumbled the man in authority. "You boys, nowadays, are all brought up in cotton wool. When I was at school we had to stand far colder weather than this, and never wanted fires—at least we had to go without them. Well, you may put a light to it, the nights are getting chilly."

Abbing's hair almost stood on end. Now he was lost beyond help, after all his twistings and turnings upon adverse fate. There was a sudden crackling of flame below his feet, and soon a cloud of pungent smoke came rolling up the chimney, to be blown back again by the whistling wind.

Already, in anticipation, Abbing felt himself grilled like a young St. Lawrence. But as yet it was the smoke that troubled him, and that was bad enough. He nearly tumbled off his uneasy perch in the effort to hold in a tremendous sneeze, which burst out at last, resounding through the schoolroom, to be echoed back there by starts and exclamations of surprise.

"What's that?" asked the master, sharply, suspecting some trick.

"Something in the chimney, sir."

The nearest boys rushed from their places, and heads were inquiringly poked up the opening over the fireplace.

From above in the sooty darkness came a dolorous voice.

"Oh, put out the fire, please! I want to come down."

And down he dropped forthwith, tumbling on the edge of the bars, and sprawling forward on the floor, a wet, limp, begrimed object, hardly recognisable by the crowd that pressed round with open eyes.

"The ghost!" cried some one, in genuine alarm.

"Hallo!" shouted others, lost in wonder.

"Who is it?" asked others, beginning to laugh.

"Why, it's Abbing!" proclaimed some one, as the intruder picked himself up and stood woefully huddled against the wall in his penitential attire, looking like a victim just escaped from some *auto-da-fé*.

"Abbing," said the master, in his sternest voice, "will you be good enough to explain the meaning of this foolery?"

But as we know all about it we may here leave our mischievous friend shivering in his singular plight to explain it as best he could. His courage and cleverness were all gone by this time, and now instead of speaking he burst into tears. Whatever excuses he managed to make for himself, and whatever else happened to him in the way of punishment or ridicule or catching cold, it is quite clear already that Abbing got very little good out of his joke.

(THE END.)

Contemplation.

Expectation.

Frustration.

THE VOYAGE OF THE VICTORY.

HAVING recently devoted some attention to Cabot and Frobisher, our pioneers of the north-west passage, it may not be out of place to say a few words concerning the man who was entrusted with the first of the expeditions which have rendered our modern Arctic service illustrious.

This was Admiral Sir John Ross, who went north three times, and whose first voyage is noteworthy as reopening the volume of Arctic discovery. His second voyage was that in which was found the magnetic pole, and it is also celebrated as the one in which steam was first used for Arctic work; so that Ross's expeditions opened a new epoch in several senses.

John Ross saw an immense amount of sea service, and was employed in no less than seven-and-thirty different ships, and wounded thirteen times. He was the son of a Scotch minister in Wigtonshire, and was born near Stranraer in 1777. He entered the navy when he was very young, according to some authorities when only nine years old, and was immediately sent as midshipman to the Mediterranean. Thence he went to the Baltic, and was kept fully employed all through the long French war. He gained his lieutenantcy in 1806; and was in due course captain of the *Briseis*, the *Actæon*, and the *Driver*, in all of which he found plenty to do.

In 1818, when the first north-west-passage expedition was resolved upon, Ross was given the command, with Parry as his second. He was in the *Isabella*, Parry was in the *Alexander*, and on the 28th of April they left the Thames. The expedition was, frankly, a failure. The ships got through Davis Straits into Baffin Bay, and were entering Smith Sound, when Ross, to the astonishment of his officers, announced that he saw mountains ahead barring the road. These mountains are the most mysterious things in Arctic travel. They of course never existed, and Parry avowed that no one but Ross ever saw or thought they saw them. Anyhow, they were appropriately named "The Croker Mountains," the names of the ships were given to the two capes at the entrance of the Sound, and Ross made all sail for England. His officers were disgusted, and the captain's conduct even now is unintelligible. The first of Britain's new series of Arctic voyages was not one of which to be proud. The most charitable supposition is that Ross found that the passage would take him longer than he was provisioned for, and seeing all going smoothly, was driven to his wits' end for an

excuse to return, and, finding none, boldly invented the barrier of hills.

Ross was not, like his nephew James, an enthusiastic explorer. His idea throughout was that of a captain sent to make a certain passage in the shortest possible time, and in this and his subsequent voyages he kept on his way past the mouth of many an inlet and promising channel to explore which might have delayed his progress. The results of the cruise were trifling, the only fact about it worthy of note being that at one point the snow that covered the cliffs instead of being dazzling white was bright red! Samples of the snow were taken, and it was found to thaw into a liquid "the colour of muddy port wine"! This red-snow story was received with much incredulity, but time has proved its truth. The colouring is due to a lichen of rapid growth.

The command of the next expedition northwards was given to Parry, who did not believe in the Croker Mountains, and was thoroughly imbued with that exploratory sense in which John Ross was wanting. Parry's discoveries were as numerous as those of Ross had been scanty. The mountains vanished, and Lancaster Sound, instead of a landlocked bay, proved to be the gateway to the Arctic seas.

In 1829 Captain Ross was given a chance of redeeming his previous failure. He was an enthusiast in steam navigation, and was quick to perceive the advantages of employing steam among the icebergs and icefloes. If a north-west passage existed it could be more rapidly traversed in a steamer than in a sailing vessel, and, as John Ross's idea of the Arctic problem was the purely professional one of making the voyage from point to point in the shortest possible time, a steamer was just the ship to suit him.

Mr.—afterwards Sir Felix—Booth advanced the funds for the expedition, and in May, 1829, Ross sailed on his great voyage. With him as his associate in command went his more famous namesake—and nephew—James Clarke Ross. The chief ship was the *Victory*; with her went the smaller *Krusenstern*, lent by the Government.

The *Victory*, unless her portrait belies her, was a most curious specimen of naval architecture. She was a three-masted paddle steamer, high of stern and bluff of bow, and with a smoke-stack rising from between her squat-looking paddle-boxes to very nearly the height of the foretopmast crosstrees. The diameter of this huge affair would seem to have been about a fifth of the vessel's beam,

and its length considerably more than half the ship's length over all. Her masts were very lofty and rigged in a most peculiar fashion. The foremast had yards like an ordinary ship, but the main and mizen masts had no yards, but three gaffs apiece, one over the other. In fact, the *Victory*, as she started, was a barquentine with half a dozen spankers.

We say "as she started" advisedly, for when she got to work among the ice her preposterous sail-plan was abandoned. A wreck was met with—that of the *Rookwood*—and the masts out of the wreck replaced those she had started with from the Thames. The curious barquentine arrangement was abandoned, and the *Victory* became a smart-looking barque with a small mizen. The engine also was a failure; the boilers leaked, and the smoke rolled forth from the chimney in such volumes as to smother everything in soot and dirt. In the story of the voyage there is something quite comic in the horror and disgust with which the sailors seem to have regarded the engine which proved of so little use.

The cruise of the *Victory* was an adventurous one. The Rosses were lost to the world for four years, and were supposed to have died; and Back was sent out on an expedition from Hudson's Bay to search for them. Their route lay through Lancaster Sound into Prince Regent Inlet, and at Felix Harbour, on the east of the tract named by Ross Boothia Felix, after his patron, the winter of 1829 was spent. Year after year the course of the *Victory* was intercepted, the winters coming so close together that only a few days separated one from the other.

It was while frozen in here in 1831 that Sir James Ross made his expedition to discover the North Magnetic Pole. He started in May, and on June 1st reached the spot where were some Eskimo huts that had not long been abandoned. "The place of the observatory," he says in his report, "was as near to the magnetic pole as the limited means which I possessed enabled me to determine. The amount of the dip as indicated by my dipping-needle was 89° 59', being thus within one minute of the vertical; while the proximity at least of this pole, if not its actual existence where we stood, was further confirmed by the action, or rather by the total inaction, of the several horizontal needles then in my possession. These were suspended in the most delicate manner possible, but there was not one which showed the slightest effort to move from the position in which it was placed. I

made known to the party this gratifying result of all our joint labours, and it was then that, amidst mutual congratulations, we fixed the British flag on the spot and took possession.

the stores were taken out of her and careful preparations made for a long boat journey. By the end of May all was ready, and on the 29th of that month the last farewell was bidden

seen every man out, in the evening I took my own adieu of the Victory, which deserved a better fate. It was the first vessel that I had ever been obliged to abandon, after having

"The colours were hoisted and nailed to the mast."

sion of the North Magnetic Pole and its adjoining territory in the name of Great Britain." A cairn was erected from the stones around, and under it was buried a canister with a record of the proceedings. The latitude was $70^{\circ} 5' 17''$, the longitude $96^{\circ} 46' 45''$.

After the third winter it was resolved to abandon the ship, and in the spring of 1832

to the Victory. Says John Ross, in his story of his voyage:—

"We had now secured everything on shore which could be of use to us in case of our return, or which, if we did not, could prove of use to the natives. The colours were therefore hoisted and nailed to the mast, we drank a parting glass to our poor ship, and, having

served in thirty-six, during a period of forty-two years. It was like the last parting with an old friend, and I did not pass the point where she ceased to be visible without stopping to take a sketch of this melancholy desert, rendered more melancholy by the solitary, abandoned, helpless home of our past years, fixed in immovable ice."

Ross led his men to Barrow Strait, and had to pass his fourth winter at Somerset House, on Fury Beach, where Parry had abandoned the *Fury* during his third voyage. In August, 1833, the ice broke up, and the boats made their way into Lancaster Sound, where a ship was seen. At first she was sailing away from them, but the wind fell, and in the light wind the boats got near enough to be sighted. A boat was put off from the stranger.

"What ship is that?" asked John Ross.

"The *Isabella*, of Hull, once commanded by Captain Ross!"

"I am Captain Ross!"

"I know you are not. He has been dead for the last two years!"

However, all doubts as to the identity of Ross and of the *Isabella* were soon cleared up, and another curious coincidence added to the Arctic records. For his expedition Ross received his knighthood and a gift from the nation of £5,000.

For the six years ending 1845 he was consul at Stockholm, and during the time made quite a famous pleasure voyage across the North Sea in a yacht of diminutive dimensions. In 1850 he once more visited the Arctic, going out in the *Felix* in search of Sir John Franklin. His third voyage, like his first, was, however, barren of results, and it is on his second voyage that his reputation rests.

He wrote a treatise on steam navigation and several other books. He died in 1856. The description accompanying his portrait by Maclise was rather more graphic than complimentary. "Sir John bears no small similitude to a walrus, one of the greatest personages about the Pole, and gets through the various straits, creeks, and bays of a miscellaneous party of prattlers with the same kind of heavy alacrity that we may conceive distinguished his attempts to find a North-West Passage!"

THE FLYING SHIP.

ON Friday, 26th of September last, there passed and manœuvred over Paris the most successful of recent aeronautical machines. Tissandier's electric aerostat was on that day inflated with hydrogen gas, and at twenty minutes past four o'clock rose from the laboratory at Auteuil.

The wind was in the north-west, and at first the machine was allowed to drift with it like an ordinary balloon. Not for long, however, did this continue. The screw was set going and the helm put down; and the astonished spectators saw the aerostat make

At St. Lambert she was allowed to fall off, and then she was guided so as to pass over the observatory and cruise up to the Luxem-

This is not a romance, but a statement of fact. Those who wish to go further into the details of the voyage will find the chart duly

Fig. 2.

Fig. 1.

a long sweep to the south, and curving round work away to windward, with the wind only four points from her line of progression. Instead of drifting to Genouilly, the aerial ship proved as weatherly as a clipper, and headed up to St. Lambert.

bourg, again on the starboard tack. From the Luxembourg her course was laid almost due east to the Seine, and following the eastern bank she passed nearly over Charenton, running before the wind to Creteil. At

published in "La Nature" and the scientific journals, and the report in the daily papers. To drive an aerial machine of any sort against a head wind had been said to be impossible, and here it was done while thousands looked on and wondered.

There were three persons in the car—M. Lecomte, who was seated on the top in charge of the helm, M. Albert Tissandier, who was in charge of the ballast, and whose duty it was to keep the machine at the same altitude, and M. Gaston Tissandier, who was at the engine and fans, giving the motive power to the ship. This power was obtained from a large bichromate battery, and was sufficient to enable the vessel to outstrip the wind when driving in its direction, and to stand still or progress in the teeth of it.

The weights of the different parts of the apparatus were all carefully taken. The aerostat itself weighed three hundred and seventy-four pounds, the stretcher weighed seventy-five pounds, the car weighed two hundred and twenty pounds, the engine and battery weighed six hundred and sixteen pounds, and the grapnel and guide rope weighed one hundred and ten. The total weight of the machine was thus fifteen hundred and fifty pounds in round numbers, and to that should be added eight hundred and fifty pounds of ballast and the weight of the travellers, which, averaged at ten stone each, would give us four hundred and twenty pounds, and make the weight that left the ground at Auteuil and manœuvred to Marolles over two thousand eight hundred pounds, or about a ton and a quarter.

The shape and general appearance of the

Creteil she wore and bore away to the north, and then making another and final change she slipped along with the wind behind her south-eastwards to Marolles, where she descended at twenty minutes after six, after a cruise of about eighteen miles.

ARMS OF THE ARCHBISHOPS AND BISHOPS OF THE CHURCH OF ENGLAND.

machine can be gathered from the illustrations here given. The oval form had already been adopted by Giffard and Dupuy de Lome. It was a very difficult one to construct, owing to the complication of the gore curves. The length of the oval was ninety feet and the breadth thirty. It was made of glazed calico coated with impermeable varnish.

The car was a large cage, formed of bamboos lashed together with cords and covered copper wire, and it had a floor and edging of osiers and nut sticks. The ropes by which it was hung to the aerostat were, for fear of accident, sheathed at the end with gutta-percha, so as to be preserved from contact with the acid that fed the cells. The guide rope and grapple were hung from the crown about six feet above the car.

The lifting power of the machine was provided by the hydrogen gas, the driving power was given by the Siemens motor. The screw had two blades, covered with varnished silk and strutted with steel bars, to give them rigidity and keep them in shape. The axis projected some distance in front, and the struts led down to the extremity. The propeller was about ten feet in diameter, measuring from the extremities of the fans. It was geared down to a tenth, so that 1800 revolutions of the motor gave 180 of the screw. There were four batteries, each of six cells, having eleven carbons and ten zincs side by side, the zincs being easily removable, and of such size as to work for three hours. Each compartment of the battery communicated by means of an ebonite tube with a very light bucket of ebonite, in a basketwork case, which was covered with indiarubber and contained the strong bichromate of potash solution.

The object of this arrangement was to allow of the battery's being thrown in or out of action by raising or lowering the acid. When the bucket was raised, by means of a line and pulley, the liquid flowed into the battery; when the bucket was lowered it flowed out. The four batteries thus gave twenty-four elements, fed by four buckets of ebonite, each bucket containing six gallons of bichromate of potash.

The batteries were placed across the centre of the car, two near the floor, and two on a shelf above them. The buckets were placed in front, two on each side, at right angles to the batteries, with the lines and pulleys all ready for lifting. On the other side of the batteries were the grapple and ballast and valve lines, so that they formed the division between the driving and floating departments. It required two men to work the ship, one on the bow side of the batteries, to take care of her vertical course, the other aft of the batteries, to take care of the horizontal course.

On the occasion of the famous ascent the rudder, whose ropes lead down among the buckets, was in charge of a passenger, who sat above the machinery. Twelve months before an ascent had been made, meeting with only qualified success, owing to the rudder being ineffective, but now, with new gearing, the helm acted admirably, and the vessel, as we have seen, was manoeuvred with almost as much ease as if she were a boat on the water. The rudder was of silk, stretched on a steel triangle, and fixed as shown in our illustration.

In our second illustration we have a view of the machine stem on, with the side ropes hanging down by which it was held during inflation. The blades of the screw are horizontal. The two dark lines of shading are the batteries, and the patches beneath them on each side are the buckets containing the acid. The grapple and ropes shown in the other cut have been removed to clear the view.

In our "Adventures in the Air" in the fifth volume we mentioned that the machine was under construction, and we now chronicle its success, as being one more step towards

the long hoped-for solution of that great problem of these later days, the navigation of the atmosphere.

OUR BISHOPS AND BISHOPRICS.

(See Coloured Plate.)

IDA, the Flamebearer, captured the rock of Bamfborough in 547, and drove the Romano-Britons back around him until he had cleared sufficient space to found the kingdom of Bernicia. His fourth son, Æthelfrith, greatly widened the northern realm, and then turned the Bernician arms against Deira, whose once famous Ælla had become aged and infirm. The contest ended in the defeat of the ancestors of the Yorkshiresmen, and the victory of Ida's son was one of the immediate causes of the Christianising of the English.

Ælla's son was driven forth a fugitive to wander through the land, and many of the natives of Deira were sold into slavery. Says the late John Richard Green:—

"The struggle filled the foreign markets with English slaves, and one of the most memorable stories in our history shows us a group of such captives as they stood in the market-place of Rome, it may be in the great Forum of Trajan, which, still in its decay, recalled the glories of the Imperial City. Their white bodies, their fair faces, their golden hair, were noted by a deacon who passed by.

"From what country do these slaves come?" Gregory asked the trader who brought them.

"The slave-dealer answered,

"They are English,' or as the word ran in the Latin form it would bear at Rome, 'They are Angles.'

"The deacon's pity veiled itself in poetic humour. 'Not Angles, but Angels,' he said, 'with faces so angel-like! From what country come they?'

"They come,' said the merchant, 'from Deira.'

"De ira!' was the untranslatable word-play of the vivacious Roman—'ay! plucked from God's ire and called to Christ's mercy! And what is the name of their king?'

"They told him 'Ælla,' and Gregory seized on the word as of good omen.

"Alleluia shall be sung in Ælla's land!' he said, and passed on, musing how the angel faces should be brought to sing it."

And Gregory did not forget the fair-haired slaves, and to him belongs the honour of having made the first great temporal conquest of the spiritual power. Hitherto the efforts of the Christian missionaries had been mainly if not wholly restricted to the Roman Empire; to no people had they gone to whom Latin was not the official tongue.

With the conversion of the English a new era begins. We were the first free people to come within the pale, and unfortunately, or fortunately, the conditions of the conquest were not then intelligible to those by whom it was effected. The ministrations of the Church, instead of being in the language of the people, came to be conducted in a tongue unknown to them. The languages of the Gauls and the other tribes of the Continent were but provincial dialects, into which it was deemed unnecessary to translate the service books; the speech of the English was looked upon as of similar unimportance, and hence the error which was to have such eventful consequences. Gregory wished himself to bring the Gospel to the English, but he was too able a man to be spared from Rome, and when he became Pope he entrusted the mission to Augustine—or, as it would be better to call him, St. Austin, to distinguish him from his great namesake, Augustine of Hippo, the famous father of the Church.

Meanwhile Æthelfrith had tightened his hold on Deira. Edwin, the son of Ælla, was in hiding among the minor kingdoms

of the island; and Æthelberht, the King of Kent, had become the most powerful prince of his day, and been recognised as the one most capable of leading the nation. He was, in fact, Bretwalda—the third who bore the title—and his safe-conducts held good throughout the country.

Æthelberht had married Bereta, the daughter of one of the Christian kings of the Franks. She had not been required to change her religion, and so had brought with her to Canterbury her chaplain, Bishop Liudhard. The king had given him the old church of St. Martin to minister in, and thus familiarised the Kentish men with Christian worship before the coming of Augustine.

In 597 Augustine and his monks landed at Ebbsfleet, as Hengest had done. A cross recently erected by Earl Granville now marks the spot. The king, for fear of witchcraft, received them in the open air on the chalk down above Minster. Augustine spoke no English, and had brought Gaulish interpreters with him, and one of these translated the long sermon in which he told his mission to the king.

The king's reply was in that true spirit of fairness which distinguished the reception of the faith throughout the island. For in England the change of religion was honourable to both sides, and was the result of fair argument and conviction. There were no persecutions, no conversions at the sword-point. The watchword was that of free men, "Hinder none, constrain none!"

"Your words and promises," said Æthelberht, "sound very good unto me; but they are new and strange, and I cannot believe them all at once, nor can I leave all that I and my fathers and the whole English folk have believed so long. But I see that ye have come from a far country to tell us that which ye yourselves hold for truth; so ye may stay in the land, and I will give you a house to dwell in and food to eat; and ye may preach to my folk, and if any man of them believe as ye believe I hinder him not!"

And so the monks entered Canterbury, bearing in front of them a silver cross, and singing the litany, "Turn from this city, O Lord, Thine anger and wrath, and turn it from Thy holy house, for we have sinned. Alleluia!"

Augustine soon after went back to Arles to be made bishop of the English, and then returned and repaired the old Roman church to be his cathedral. The faith spread. Æthelberht became a convert, and his recommendations everywhere ensured the safety of those that bore them. Augustine met the old British bishops from Wales on the banks of the Severn, opposite Portskewet, but the conference ended in nought. The difference in keeping Easter and in a few other minor matters proved fatal to any scheme of coalition, and the old Church organised on the Eastern rite remained independent of the new. But the spot where the meeting took place still in its name of Anst Cliff commemorates the first bishop, or rather Archbishop, of Canterbury.

(To be continued.)

Correspondence.

A BLUECOAT.—There is no difference. The idea that an orchid is found on trees, while an orchis is found on the ground, is novel—but erroneous. One is the technical name, the other the popular.

J. McE.—The "Building of the Swallow" was in the second volume.

HENRI.—We fail to understand what you mean by a "clerk or that line." As a clerk you will be useless in the colony; as a clerk in the building or any other line you may get a situation, not for your knowledge of mechanical clerical duties, but for that of your special trade. Keep to a special business, and look on your clerkship as an apprenticeship to that business.

TOURIST, W. R. I.—To all such questions the reply is—buy a map and choose your own road. The ability to thoroughly understand a map, and to make your way by one, will always be of use to you in after life. An ounce of practice is worth a pound of theory; and when, as in this case, you have the means of acquiring useful knowledge practically, never neglect it. For clothes wear tweed or flannels, have a soft hat or cap, and a sound pair of comfortable old boots, that have been soled and heeled at least once, and worn for a week previously. Two meals a day would be enough—a meat breakfast and a meat tea.

CHERRY RIPE.—The stations of the ships of the British Navy on active service are published every month in the service papers, such as the "Army and Navy Gazette," and also in many of the weekly papers, and a reference to the list will inform you of the vessel's whereabouts.

J. A. FORBES.—We never heard of the guide, but there is a shilling handbook to New Zealand, obtainable from Shaw, Savill, and Co., another shipping firm. A reference to the "Times" will give you a list of shipowners. The fullest book on Australasia is Gordon and Gotch's Handbook; their address is Bride Street, Ludgate Circus. Messrs. Silver and Co., of Sun Court, Cornhill, also publish a handbook. Apply direct for terms, including postage.

M. H.—You should apply to the agency of the Canadian Government, and get a list of books on the colony by return of post. The Canadian Government Offices are at 9, Victoria Chambers, Victoria Street, S.W.

P. R.—The "Curfew will not ring to-night" is in the "Library of Religious Poetry," published by Sampson Low and Co., and in many of the "readings" books.

J. PAUL.—If you are foolish enough to give money without seeing the application in print you must put up with the loss. It is quite untrue that we ever made such an offer, or said anything that might be construed into our having done so. You must have been dreaming to suppose that a magazine like the BOY'S OWN PAPER would ever countenance such proceedings.

INFLEXIBLE.—You can obtain information regarding the Naval Volunteers by applying to the Admiralty, or looking out the address of their headquarters in the London Directory.

G. FRASER.—The uniform and head-gear of our regiments depend largely on the climate and the country in which they are serving. At home the Scots Greys wear bearskins and ride on grey horses.

SOUTHERN +.—Better underprint than overprint; you see modesty in this instance is the best policy, but we regret you did not have enough sent out to Brisbane. There are agents for the BOY'S OWN PAPER in California, and you will have no difficulty.

POTTER HEIGHAM.—The numbers for the time you mention had gone to press weeks before the date of your letter. It is useless communicating with us in matters requiring immediate replies.

WOULD-BE GEOLOGIST.—Not at all. It takes at least a year to form an inch of chalk, and the chalk is over a thousand feet thick. It takes nine feet of peat to form one of coal. Peat accumulates at the rate of a foot per century, and in places the coal-measures are over three miles in thickness. A coral reef increases at the rate of one inch in height every eight years, and some of the existing reefs are two thousand feet thick. And these rates take no notice whatever of the consolidation by pressure and chemical action.

D. C.—The largest fresh-water lake on the globe is probably Superior, in North America; but the Victoria Lake in Central Africa is very nearly as large.

COW PAW.—Leather is dyed red in a solution of alum or tin salts in a decoction of cochineal. Or dissolve an ounce of cochineal in half a pint of hot water, and add to it a quarter of a pint of spirits of harts-horn.

W. G. S. J.—The papers for all examinations are supplied by the publishers who sell handbooks for the candidates. Apply to the Queen's Printers, Harding Street, Fetter Lane; or Messrs. Stanford and Co., Effingham Wilson, Harrison and Sons, or any other first-class firm.

C. B.—The best throw of the cricket-ball recorded is that by G. Brown in 1819, on Wolverton Common, when he is said to have thrown it one hundred and thirty-seven yards, but it is the custom to doubt the measurement. W. F. Forbes threw one hundred and thirty-two yards at Oxford in 1876. A hundred yards is a good throw.

ANXIOUS.—The articles on Hammock-making were in the July part for 1880.

HAROLD.—The chalk is carbonate of lime. Drop it into the vinegar or acid, and you will see the bubbles of carbonic acid gas rising through the fluid.

W. S.—A book on the woollen manufactures of Great Britain is published by Messrs. Stanford and Co., Charing Cross, in their "Manufacturing Industries" series.

W. WHITE.—You can get Stainton's "British Butterflies and Moths," which has coloured illustrations, and costs half-a-guinea; or Newman's "British Butterflies;" or perhaps your best plan would be to write to Wheldon, second-hand scientific bookseller, Great Queen Street, Lincoln's Inn Fields, and enclose stamps for his catalogue; or buy a number of the "Science Monthly," or "Science Gossip," or "Knowledge," and consult the advertisements.

B.—In the July part for 1883 you will find two articles by Dr. W. G. Grace, explaining how cricket bats are made, and how they are best kept in order and repair.

MARS.—1. The kite-string should be fixed at the mast-hole, or just enough in front of it to avoid burying the bow. 2. The catamarans of the savage races undoubtedly sail as described, and reel off their knots in an astonishing way, but they do not beat to windward. A close reach is as near as the majority get. Our catamaran will do what we said it would, and no more. Two or three years ago the "Field" gave the lines of a catamaran, and particulars as to its behaviour. The lines are republished in Dixon Kemp's "Yacht and Boat Sailing."

ANXIOUS.—The Agent-General for Queensland has offices in Westminster Chambers, Victoria Street. Apply there for information as to mode of proceeding to the colony. No charge is made.

M. M. M.—A contrivance such as yours for driving a sledge on ice by a toothed wheel driven bicycle-fashion was published in the "Scientific American" about twelve months ago.

NAUTA.—Get the shilling "Under the Red Ensign" from Kent and Co., Paternoster Row, or any nautical bookseller. It will give you full information as to pay and prospects in the merchant service.

WALNUT-WOOD.—The simplest way to blacken wood is to hold a slate over gas, lamp, or candle, and catch the black, and then scrape it off, mix it with French polish, and use in the ordinary way.

A MONTHLY READER.—1. There were five articles on Cardboard Modelling, beginning in the December part for 1882. 2. You can get shilling books on painting of the artists' colourmen. 3. The BOY'S OWN PAPER is as well known in the colonies as here, and can be procured from our agents on your arrival. 4. "Model Yacht Building," by Mr. Ashworth, was in the second volume.

JIM.—Buy "Practical Canoeing," published at 156, Minories. It will give you the sail plan complete, and tell you how to handle it.

A Stray Shot.

No. 316.—Vol. VII.

IVAN DOBROFF:

A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

Late Examiner to the University of Moscow, Professor in the Roman Imperial College of Practical Science, etc.,

Author of "Harold, the Boy-Earl," etc.

CHAPTER IX.—SOCIAL LIFE IN THE KREMLIN.

BESIDES the churches, monasteries, courts of law, arsenal, barracks, armoury, museum of military curiosities, and palace of the emperors of Russia, the Kremlin at Moscow contains some of the most magnificent official dwellings in the world. To one of these we are about to introduce the reader.

We have to go down a street within the walls of the Kremlin with our backs to the river. The palace is on the right hand with the official residences referred to beyond, but in a continued line, so that the high officials there dwelling may at any moment enter the grand rooms of the palace itself.

We stop at a grand arched door within which are three other doors so arranged as to prevent the exit of heat in the winter or its entrance in the summer. On guard within is a stately functionary in black and green and red and gold. Black knee-"shorts" and white stockings clothe the nether man, who has on a dark-green livery with a high collar like those of the court dress at St. James's. Over this he wears a scarlet cloak bordered with a pattern produced by the repetition of Imperial eagles, so arranged as to form a stripe. The head of this functionary is surmounted by a low-crowned cocked hat with a broad border of rich gold lace. In his hand he carries a mace of office with a thick gilt globe at the top. This

"At last the train came up to the platform."

imposing figure, when he sees us trying to enter, orders a soldier to open the outer door,

and receives us by opening the inner door for us himself.

The hall is vaulted and spacious. A magnificent staircase, covered with carpet of crimson velvet pile, leads to the rooms above. In the hall itself, for we cannot go upstairs yet, there are two or three magnificent fellows in the livery of the Imperial lackeys, grand as the footmen of our earls. Then three or four equally grand creatures physically, though attired in evening black "claw-hammers," white neckties and brilliant shirt-fronts, come out of a waiting-room where they lie perdue until wanted. They are not exactly wanted now, but they crowd out with a view to teaching a stranger how to bear Imperial glances as retailed by them. On each landing a liveried menial appears as if by magic, without noise, without effort.

A senior in claw-hammer and white tie approaches, and almost respectfully claims the favour of your name and to be informed whom you wish to see. We give our name and say that we wish to see "Count Schaafstadt," and he gives us a quiet look which says, "Can it be possible?—wants the count?" He looks again to be certain whether we are in sober earnest or not. He appears convinced that we are not joking, and the look significantly says, "He *will* have it his own way! I have warned him by my glances—he must rush on to his fate. But will the count receive him? Not likely!"

All this is but flashed from the eye of the gorgeous servant. At last his voice is heard—a sort of rich smooth oily voice flowing greasily from him.

"Here, Stefan. Gentleman's card."

Then he looks at us, as much as to say, "That is about as near as you'll get to the count."

First servant now takes card, puts it in silver salver, goes upstairs to first landing. Second lackey takes card, goes up his part of the staircase, and passes it on to a third. He is standing in a corridor richly carpeted and studded with chairs for the pampered servants. At last one in claw-hammer and necktie comes from a room with a silver waiter, on which the card is laid. And he vanishes through a door, and is seen no more.

The first lackey has given his salver to the senior in evening dress, who puts it down on a slab in the hall. He looks at you as he does this, and whether he begins to feel sorry for you, or whether he begins to think you may be a person of distinction and it won't do to offend you, or whether he thinks you must be a hero to stand all those Imperial glances from all those Imperial lackeys—whatever may be his motive, he asks you whether you would like to go into the waiting-room. Cheerful acquiescence in this suggestion shows him that you know something of the ways of court. You are introduced into a well-furnished ante-room, a handsome chair is put for you, and the servant withdraws.

Scarcely has he left the room when a voice is heard on the landing, saying, "Mr. So-and-so, *immediate* audience." A more consequential menial than any hitherto beheld enters the room and begs the favour, very humbly, of your accompanying him. The others look defeated and sorry; you triumph, and upstairs you march rejoicing. You are introduced into the blue-silk drawing-room,

where the chairs are white-and-gold covered with blue damask silk. The curtains at the windows, the portiers before the doors, are of blue silk, and the cornices are richly carved and gilt. Sofas, settees, little tables, and the usual luxuries fill the numerous niches. To the left of this room is the count's "cabinet," or library as we should call it, well filled with rare books in various languages and in gorgeous bindings. At a handsome writing-table the count is sitting with piles of papers before him. He is a handsome man of about forty-five, in a plain morning dress of black. His countenance is calm and refined: he is closely shaven except a slight moustache. There is much dignity as well as kindness in his expression.

"My dear Dontchenko," says the count to a secretary who has just entered the library, "here are the drafts for all the letters for to-morrow. Here are all the documents signed, and in the third packet are the letters, all in my own hand, of which we spoke. They are ready for instant delivery. Many thanks." He then touches another bell, and a confidential servant is at his side directly. "Tell the people below that I do not receive any more to-day. Stay, is any one below?"

"Prince Bluedollskie."

"Never mind him. Who else?"

"The Count Strelinski."

"I will see him to-morrow. Who else?"

"Baron Schimmelinski."

"Get rid of him somehow. Who else?"

"The young Prince Tcherbolinski."

"Show him up to the countess."

"He asked for your Serene Highness."

"Do you understand what I say?"

"Yes, your Serene Highness."

"Then do it. Who else?"

"The General Kakaroff."

"Show him up to me. Has he been waiting long?"

"About an hour."

"Sorry for that. Never mind, show him up."

The man was gone instant, and in an incredibly short space of time returned, announcing, "His Excellency General Kakaroff."

"My dear general, how glad I am to see you! That was sharp work at Zakolniki the other day. We were speaking of it only this morning at breakfast. It was splendidly done on your part. I can imagine the fright of the man of money as his strong box exploded! But in what can I aid you?"

"You can aid me, I fancy, very materially. Do you know the Abrazoffs?"

"What, Nicolai Alexandrovitch, of Berozovo?"

"The very same. You know him, then?"

"Oh yes, I have known him many years, but I think the countess knows him better than I do. I am sure that she knows his family well, especially Ekaterina Petrovna (Madame Abrazoff)."

"She has met with a frightful accident."

"How? what? Madame Abrazoff?"

"Precisely. She left Oozonovo this morning by the express, which was retarded to put on an extra carriage for her people, and some of our Nihilist friends had an idea that such delay and alteration could only be for the Imperial family, and therefore wrecked the train.

Ekaterina Petrovna was saved by a young Englishman, who contrived to pull her through a side window. He saved, at the risk of his own life, the lives of this lady, her daughter, a German governess, and a German doctor who were in her suite. Of course I do not know the particulars. Tamarinskie has stopped the traffic and has sent down a train of gendarmes, medical men, nurses, litterers, and so forth. He came to me for the gendarmes."

"Curious! That young Englishman is coming to me to read English with Sascha and Serge. Why she should come I have no idea."

"She was telegraphed for at my request by her husband. Some of my people are inclined to connect Abrazoff with the Dobroff mystery, and I want your opinion of the man and any particulars which you may be able to give me about his history. My people already know something about him—in fact, much, but not what I want. I have examined a certain General Zakoffsky, who has awakened suspicions in my mind, and that is all. I want to know more, and know it for certain."

"How can I give you particulars of a man of whom I know so little? Besides, he is not at all sympathetic. He is not in our set, and, my dear general, in a word, I don't like him. So you see that my evidence would be partial and distorted, and not of the least use to you."

"Pardon me, but I value your judgment so highly that I would balance your words against the evidence of my own senses. Besides, what I want you to do is this. Do not think it treacherous; it is only necessary—"

"Mon cher général," interrupted the count.

"Excuse me, count," said the policeman. "What I want you to do is to give me opportunities of meeting this young Englishman freely here. Introduce me as a member of your family. You need not tell him what my official position is. There are most extraordinary interests at stake. A certain Princess Tcherbolinski has thrown herself heart and soul into it, and in the family of the Gosudar (Emperor) himself there exists immense interest about this boy, who is as completely lost as a needle in a bottle of hay. We have the house to which he was taken. It has long been under our surveillance, but he has been spirited away, although the most watchful of our men are there on duty. The student is safe in the house, *but the boy is nowhere*. It is like magic. The people who have the house in the Novoye Derayvnie are chiefly thieves and their associates, except a strange German, whom we are watching with interest. He has mixed himself up in the most open way with the Nihilist party, and whether he be a very deep villain or a shallow, crack-brained fool I am puzzled to make out. I have frequently been there, and he little suspects who I am."

"Is it possible? You with him? How interesting! Do come and delight the countess and Olga with this story."

"Pray excuse me, count. It would be well to say as little as possible to the countess—or, indeed, to anybody living—on the subject of the Dobroff mystery."

"I promise you to be discreet; but I am immensely interested myself, especially in the inhabitants of the strange house you have been describing. It is an

ugly neighbourhood. But what of the German?"

"He has joined a certain club or party of the so-called Nihilists; but either he is mad or very clever in hiding his real intentions from us. There is only suspicion against him yet, and we want him to do something to commit himself, and then we send him off to Siberia at once. I keep him as a decoy duck to bring other people in. This fellow Palitzki, for example, is really dangerous, and I only want a decent opportunity to send him to Siberia. I would send him now but for the use he will be to us. But he is as safe as though he were off already. The German calling himself Hermann is really [here he whispered to the count, who started]. His brother-in-law has a factory at Kursk, or near it. A singular thing about this man is the way in which he treats his daughter. In the midst of the vilest associates, in the very vortex of filth and misery, he contrives to have a refined and elegant home for her. In one of the most ruined houses in Moscow there are three or four rooms well furnished and perfectly respectable. I have several times wondered at the skill, muscular strength, and *will-power* of this man. I have conversed with his daughter, who is as fresh as though just out of a German village in Pomerania, and I have always found her a most refined and charming girl. I know his brother-in-law, Steinfeldt, near Kursk—"

"So do I," interrupted the count; "he recommended a German intendant to me, whom I greatly like and fully confide in." Kakaroff smiled.

"Of course," continued he, "*you* would never confide in any one!"

"On the contrary, my dear count, I am confiding in you!"

"Certainly, and I am immensely flattered! Now, how about your introduction to and acquaintance with young Tenterton? Had you not better begin to 'cultivate' us at once? We dine at seven; now stay and dine with us, *sans façon*. The countess will be charmed!"

"You are too amiable. Perhaps you are right; but in that case I must telegraph to my people."

"Certainly. There is a telegraph in the office below. Will you write a message or send it in cypher?"

"Thanks, my dear count; I will accept all your offers, and will go down to your office and send my lines myself in cypher."

The count then led his guest to the telegraph-room and delicately left him alone, telling him that he would find a servant at the door of the chamber who would conduct him back to his (the count's) library.

"Many thanks; but I fancy I know the way about the Kremlin almost as well as you." The count looked surprised. "But I shall be glad of your man as a blind. So, au revoir."

The count was greatly amused with all these revelations. The wily police-master had just used the best means to secure the good count's aid. He would have had it in any case, for Schaafstadt was too loyal a gentleman and too true a servant of the Crown to flinch at anything to serve his master the Emperor. The whole *entourage* of Alexander II. was more or less imbued with a spirit of devotion to him, and this was perhaps one of the reasons why the Nihilists determined to get rid of him, naturally concluding

that such devotion was not likely to be transferred to another monarch.

The count entered the boudoir of the countess, which was the room beyond the "white" drawing-room, a large chamber elegantly furnished in carved walnut and grey corded silk. The countess was chatting pleasantly with a gentleman in a blue tail-coat with gold buttons bearing the Imperial eagle. On the breast of the coat he wore two stars, one of the Order of St. Anne and the other of St. Stanislaus. He was a fine portly man with carefully-trimmed moustaches and well-shaven chin, exquisite shirt-front, wrist-bands, and boots. There was a beautiful ladylike girl sitting next to the countess, who could at once be identified as the daughter of the house. Two boys were chatting brightly with an elderly lady in black who was sitting between them on a sofa in a distant corner, and the gentle rippling laughter which occasionally broke very musically from that quarter told a tale of well-disciplined kindness of heart, of frankness without rudeness, and true politeness without stiffness.

The gentleman with the stars exclaimed,

"The boys and Madame La Roche are enjoying something, countess. I wonder what it is!"

"Ce n'est rien, mon prince," said Madame La Roche, who had been the governess always about the Countess Olga ever since she was two years old, and was looked upon as a sort of "grand-mamma" in the family. "It is nothing but a story I was telling about General Aristovitch in the time of the Empress Catherine II."

"Pray let us hear it."

"The old general used to live very much on his estates after a life of active service, and became awkwardly fat, but so sensitive on this point that nobody cared to refer to it in any way. Catherine wanted to see him, so he was sent for in a hurry, and arrived at St. Petersburg, taking his uniforms with him of course. At the reception he could hardly breathe, having been forced by his valet into clothes which were much too tight for him. To secure all, however, the sword-belt had been buckled as tightly as possible around his waist, and he was 'produced' to her Imperial Majesty in a state bordering on suffocation. He had taken cold on the journey, and just as he was bending to kiss the Imperial hand a sudden fit of sneezing attacked him, and instead of the respectful kiss down came a terrific 'tschoo,' so violent as to burst the sword-belt, which let the sabre clatter with an awful noise on the floor, and the centre seam in the back of the coat went r-r-rutsch, parting the garment in two. The august company were unable to contain their laughter, in which Catherine, who was not altogether so refined as she might have been, joined. This is the story which has so tickled the boys."

The manner of the lady in relating the anecdote was irresistible. The story was nothing, but she herself was immensely stout, and acted the sneeze so well that the whole party were convulsed, and were laughing as the count entered.

"Bon jour, mon prince!" said Schaafstadt. "What a charmingly merry party! May I know the joke?"

The story was told again, and lost nothing of its queeriness in telling. The count's happy laugh, one of the most

musical sounds to be heard in Moscow, joined the chorus, and then he turned to the prince, saying,

"We dine early to-day, *en famille*. Can you remain? I will send a messenger to the princess. I want to have some chat with you, and Kakaroff is coming directly, he is in the house."

"Why, you see, count, I have been visiting schools with the minister, and am in this official costume, but if the countess will excuse that I shall be happy, especially if you will let Olga there write two lines to the princess and send them off."

The letters were soon ready.

"Send some one with this to the Princess Tchernyafskie," said the count, turning to a footman in livery who had appeared in answer to a pressure on the knob of an electric bell.

"Sie tchass," replied the servant—literally "this hour," but having the effect and design of "this very instant."

The curtain fell over the door as he disappeared, but was raised again the next moment by another servant in plain clothes, who announced,

"General Kakaroff."

A cordial, graceful reception was accorded to this important functionary, but there was no fussiness about the people. Every one seemed at his or her ease, and the conversation was merry though subdued, not exactly witty but certainly bright.

"Where is Tcherbolinski?" said the count; "they told me he was here with you."

"He was here a short time back, and left the room with Boris to look at the new English books just arrived. Oh, here they are!"

Two young men now joined the group, Prince Dmitriev respectfully saluting the elder gentlemen, and Boris Schaafstadt cordially welcoming Prince Tchernyafskie and the prefect.

"By the way, Boris," said Count Schaafstadt, "the general has told me quite a romantic story of your new English friend whom we expect so ardently."

"Oh, do tell us all about it, papa," cried the boys, in chorus.

"No, no, it is not my story. General Kakaroff must tell it if he will be so obliging."

The prefect told the story of the wrecked train and the rescue of Madame Abrazoff, which created an immense sensation. The Countess Schaafstadt seemed especially interested in the fate of the young "John Bull" who was on his way to join their family circle.

"But, count! he must be considered as one of us, although he has not joined yet. He was on the way, and as our house was the object of his journey we must really consider him as having joined. Don't you think so, prince?"

"Whatever the Countess Schaafstadt says is right, *must* be so, she is the best authority on all such points."

"Very well, then, what is to be *done*? Talking won't reset broken bones or heal wounds. Of course, now, if he be hurt they will take him to some hospital or lodgings to get well before he comes to us. My national pride revolts at such conduct. He has risked his life in saving that of a Russian lady, and I say we are bound to take him to us at once."

Here the butler announced dinner, and

the whole party rose. The reception rooms being on the same floor there was no "going downstairs to dinner" as with us.

"Now, general," continued the countess, during a pause in the dinner, and speaking French on account of the servants, "will you help me to get this English hero under our special care? Or is it better to let things take their course and wait until we hear from him?"

"I certainly should not advise," said the count, "bringing him here *vi et armis*, whether he likes it or not, under the convoy of some of our friend Kakaroff's interesting brigade."

This was answered by a smile from the prefect, who observed quietly to the countess,

"So much will depend upon circumstances. My men have been dispatched this morning to help the sufferers and to punish the assassins if necessary; at all events, to try to secure them and bring them to justice. I will promise you to send you the very first news I get myself, and more than that, if the train should bring your English hero much shattered or injured to Moscow, I will, if you wish it, have him sent on to you."

At this moment a servant in the Imperial livery came into the room, bearing a telegram on a salver, which he presented to the count, who read the superscription, saying,

"This is not for me, Zver; give it to his Excellency yonder."

The servant took the dispatch to Kakaroff, who asked permission of the countess to open it, and then bowed to the count, who returned the bow, saying,

"Pray consider yourself in your own rooms."

Kakaroff opened the paper, and exclaimed,

"How curious! It is this very business. I am informed that the train will be in at eight o'clock, and as the station is so near we can all drive thither together."

Prince Tchernyaffskie here asked the police-master whether he had quite recovered from the injuries he had received at Zakolniki, which led Kakaroff to explain that the injuries had happened not to him, but to a Cossack, who died of them.

This led to some further very vague chat on the subject of the missing boy and the "Dobroff mystery." At last the prince asked at which Gymnasium poor little Ivan had been placed.

"He was in the First Gymnasium."

"Oh, indeed; under Schwann?"

"Yes, that is the name of the director."

"Have you asked him to help you?"

"No, it never occurred to me. How could he help me?"

"He is a strict disciplinarian, knows all about his boys—understands them too. I have a very high opinion of his abilities."

"Will you give me a card to him?"

"With the greatest pleasure."

"Perhaps you will write on it in pencil that you want him to aid me. He would then be more inclined to do so, as being the wish of his *chef*. But you had better not write in Russian on account of the servants."

"Schwann does not know French, and, although bearing a German name, he is a very thorough Russian."

"Then give me two cards, one to be sent up with mine, and the other to be shown as a special voucher from you, and containing your express desire that he should exert himself."

Dessert was finished, coffee drunk, and everything was soon in readiness for the trip.

The prince's carriage was waiting for him, and he ordered the coachman to drive *damoi* (home). An open carriage was in waiting for the four boys, and the count sat with Kakaroff in his. Two empty carriages had been sent on in advance to bring people to the Kremlin or take them to hospitals. Three more empty carriages followed.

In due time the carriages reached the station, where a cordon of police had been drawn round the building, and a considerable crowd of lookers-on—at least a considerable crowd for Russia—had assembled. Kakaroff was received by the officers commanding the parties of horse and foot police, and he very soon gave orders to them to pass in the carriages belonging to the count, and to admit his party, although, to tell the truth, the count was as well known to the police as the prefect himself, and quite as much respected.

The carriages were all drawn up. Surgeons had, by the foresight of the police-master, been provided. Litters were standing in a row, which a tolerably large detachment of the ambulance corps was getting ready for immediate use. Everything was in as perfect order as discipline could effect.

When this result had been brought about, our little knot of friends, closely attended by officers of rank in the police and gendarmerie corps, formed a breathless group waiting for the advent of the train. As is always the case under circumstances of great excitement, the persons concerned spoke in whispers, although there was no one to overhear them; and if there had been, nothing was said that might not have been confided to anybody—to a newspaper reporter, or even to ourselves.

But the effect was oppressive. It was like awaiting the return of the wounded after a defeat. At last the train came up to the platform and stopped. Among those admitted to the yard of the terminus was Mr. Abrazoff, pale with apprehension. Rushing to the carriage, he could hardly get into the saloon-car for agitation. But his delight knew no bounds when he found his wife standing in the centre with no other damage apparently than some accident to her arm, which was supported in a white scarf made into a sling round her neck. Abrazoff embraced her tenderly, and asked how she had fared, whether she was injured, and many more questions of the same kind than she could answer in that brief time. But the question, "Where is Mr. Tenterton?" was easily answered by pointing to where he was sitting with a bandage round his head. Abrazoff went towards him, exclaiming in French,

"My dear sir, how can I ever show my gratitude to you?"

"I have only done my duty," said Tenterton. "And what I have done for your family I should have done for the meanest peasant on your estate."

Abrazoff did not seem to relish this speech, although Count Schaafstadt, who had entered the carriage at the same time, understood the whole sentiment.

He advanced with outstretched hand, saying,

"Mr. Tenterton, I believe?"

"That is my name," said Edward.

"I am delighted to see you. My name is Count Schaafstadt, and I am only too happy to think that you are coming to me. I have brought a carriage for you, and there are people to take your luggage."

"Accept my best thanks, count," said Abrazoff. "I was an ass to forget the other people; but, in fact, I only thought of my wife when I heard of the accident this evening."

"Not of me, papa?" said a very sweet girl of some sixteen or seventeen summers, throwing herself upon Abrazoff's neck.

"Why, how did you come here?"

"I came with mamma, of course, and the *fräulein*, and mademoiselle, and all of them. Mr. Tenterton drew me through the window after he had rescued mamma and the *fräulein*, but mademoiselle objected to being saved or assisted by a person who could attend to a Prussian first. So she saved herself, and is badly hurt."

"Well, my dear," said Abrazoff, "Mr. Tenterton will tell us the whole story at home to-morrow."

"Excuse me," said the count, "but I flattered myself that as Mr. Tenterton was coming eventually to me he might as well come on now. His room is ready."

As all this was said in Russian the count was greatly surprised to hear Tenterton say in the same language, "If it would not be construed into a slight upon Madame Abrazoff, which I am far from intending, and if the count will be burdened with me, I should elect to go with him."

Abrazoff turned on his heel and left the carriage. Madame Abrazoff looked surprised; her daughter indignant.

"Now, Mr. Tenterton," said Schaafstadt, "I am sorry not to be able to offer you English comforts, but all my children speak English, and all much better than I do, so I shall give you one for your special companion home. Boris speaks best of all, and he shall accompany you. This is my son Boris."

We will not accompany Tenterton to the Kremlin. Boris saw the portmanteau taken care of and his new friend well seated in the landau, then gave the word—"Damoi" (home).

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XVI.—TREASON.

WHAT then had passed in camp during the absence of Cyprien and his two companions? It was difficult to say, for the young Kaffir did not reappear.

They waited for Bardik, they shouted for Bardik, and they looked for him everywhere. Not a trace of him could they find. The breakfast he had got ready remained by the fire which had gone out, and seemed to show that he had been away from two to three hours.

Cyprien was reduced to conjectures, but the conjectures did nothing towards an explanation. That the young Kaffir had been attacked by some wild beast was not improbable, but there was not a sign of any struggle having taken place. That he had deserted and gone back to his own country, as Kaffirs often do, was very unlikely, and the engineer absolutely declined to accept the hypothesis when proffered by Pantalacci.

To sum up, half a day was spent in search, yet the young Kaffir had not been found, and his disappearance remained absolutely inexplicable.

Pantalacci and Cyprien took counsel together. They decided to wait till the next day before they struck the camp. Perhaps in the interval Bardik, if he had only wandered off, might return. But in thinking matters over, particularly with regard to the visit of the Kaffirs to one of the previous camps, and the questions they had put to Bardik and Li, they could hardly help asking if Bardik had not fallen into the hands of the natives, and been taken by them to their capital.

The day ended sadly, and the evening was even more lugubrious. A breeze of misfortune seemed to play over the expedition. Pantalacci was savage and dumb. His accomplices, Friedel and Hilton, were dead, and now he alone remained to face his young rival. But he was more than ever resolved to get rid of him.

Cyprien—whom Li had told all that he had heard about the withdrawal of the cartridges—had now to watch night and day over his travelling companion, though the Chinaman intended to share the task with him.

Cyprien and Pantalacci passed the evening silently smoking, and retired under the waggon-tilt without even a "good-night." It was Li's turn to watch near the fire and keep off the wild beasts.

The morning came, and the young Kaffir did not return. Cyprien would have waited four-and-twenty hours longer to give his servant a chance of rejoining, but the Neapolitan insisted on an immediate departure.

"We can very well do without Bardik, and to stop here is to risk being unable to rejoin Mataki."

Cyprien gave in, and the Chinaman set to work to put to the team.

And here came a discovery, and a serious one. The cattle were not to be found! The evening before they had

been sleeping in the high grass round the camp. Now they were nowhere visible.

them home, were probably on their way back again to the Transvaal.

The disaster is not an unusual one in

"How far off is he?"

And then they became fully aware of the loss the expedition had sustained in the person of Bardik. If that intelligent servant had been at his post, knowing as he did the peculiarities of the South African ox, he would not have omitted tying up to trees or pegs the beasts that had had a day's rest. Usually when reaching the halting-places after a long march the precaution was unnecessary; the tired cattle never thought of straying beyond the outskirts of the waggon. But it was different after a day of rest and feasting.

Evidently the beasts' first care on awaking had been to seek for more delicate grasses than had satisfied them the day before. For the sake of mere wandering they had strayed off little by little, lost sight of the camp, and then, guided by that peculiar instinct that always leads

Africa, but it is none the less serious. Without the team the waggon is useless, and the waggon is for the traveller his house, his store, and his fortress.

Great was the disappointment of Cyprien and Pantalacci when, after a wild chase of two or three hours along the track of the cattle, they found they must give up all hope of recovery. The position was thus changed greatly for the worse, and another consultation was held.

Only one practical solution could be arrived at, and that was to abandon the waggon, take as much provision and ammunition as they could carry, and continue the journey on horseback. If circumstances were propitious they might be able to meet with some Kaffir chief, and from him buy a new team. As for Li, he could have Hilton's horse, which now wanted a master.

A lot of the thorn-tree branches were then cut and stacked over the waggon so as to hide it in a kind of artificial bush. Their food and ammunition were stowed away in their pockets and in the large linen bag which each carried. The Chinaman, to his great regret, had to abandon the famous red box, but he could not tear himself away from his cord, and so he coiled it round his waist under his shirt as if it were a belt.

All being ready, the three horsemen gave a last look into the valley which had been the scene of such tragic events, and then set out for the hills. The road, like the others in this country, was merely a path formed by the wild animals, who always take the shortest road to water.

It was past noon when Cyprien, Pantalacci, and Li started; and beneath a burning sun they kept on at a good pace till the evening. Then they camped in a deep gorge, and, well sheltered by a rock, and seated round a fire of dry wood, they said to themselves that after all the loss of the waggon was not irreparable.

For two days they continued their journey, fully persuaded that they were on the track of him they sought. And on the evening of the second day, just before sundown, as they were making for a clump of trees ahead of them, in which to camp, Li uttered a guttural exclamation of,

"Heugh!"

And pointed with his finger to a black

figure which had moved into view on the horizon in the streaks of the twilight.

Cyprien and Pantalacci looked in the direction indicated by the Chinaman.

"A traveller!" remarked the Italian.

"Mataki himself!" said Cyprien, looking through his glasses. "I can see his carriage and his ostrich."

And he handed the glasses to Pantalacci for him to satisfy himself that it was so.

"How far off is he?" asked Cyprien.

"Seven or eight miles at the least; perhaps ten," was the reply.

"Then we must give up any hope of catching him to-day."

"Certainly," said Pantalacci. "In half an hour it will be dark, and we could not think of moving then."

"Good! To-morrow we will start early and catch him."

"That is what I say."

The horsemen reached the trees and dismounted. As usual they began by carefully rubbing down and seeing to their horses before tethering them where they were to feed, the Chinaman being busy lighting the fire.

Night came on while they were so employed. The meal was a little more cheerful perhaps than it had been for the last three days. As soon as it was over the travellers rolled themselves in their wraps and lay down by the fire, with their saddles for pillows, to sleep till dawn.

Cyprien and the Chinaman were soon

asleep—not a very prudent proceeding perhaps on their part.

The Italian did not sleep. For two or three hours he rolled and twisted about in his wrapper like a man labouring under some fixed idea. Temptation had again come to him.

At last he could withstand it no longer. He rose stealthily and silently, went to the horses and saddled his own; then setting free Templar and the Chinaman's horse he led them after him. The grass which carpeted the ground stifled the sound of the hoofs, and the animals followed in stupid resignation at being so suddenly awakened. Pantalacci took them down into the valley below the camp, fastened them to a tree, and returned. Neither of the sleepers had moved.

He took his rifle, his ammunition, and some provisions. Then he coolly and deliberately abandoned his comrades in the desert.

The idea which had possessed him since sundown had been that by seizing the horses Cyprien and Li would be prevented from reaching Mataki. He thus made sure of victory. Neither the odious character of the treason nor the utter heartlessness of the robbery had any influence over him. He descended the slope, jumped into the saddle, and rode off with the two horses in the first rays of the rising moon, that was just peeping over the distant hills.

Cyprien and Li slept on. About three o'clock in the morning the Chinaman opened his eyes, gazed at the stars growing dim on the eastern horizon, and said to himself,

"It is time to get the coffee!"

And immediately he threw off his blanket, jumped up, and set about his morning toilet, which in the desert, as in the town, was anything but elaborate.

"Where is Pantalacci?" he asked himself as he glanced round.

The day had begun to break, and the objects around were growing clearer in the light.

"The horses are not there!" said Li to himself. "Perhaps our gallant friend has—"

And suspecting what had happened he ran up to the pegs, to which he had seen the horses tethered the night before. Then he ran back to the camp, and at a glance assured himself that the Neapolitan's baggage had gone with him.

There could be no mistake.

A white man would probably have been unable to resist the temptation of waking Cyprien to tell him the important news. But the Chinese was of the tawny race, and thought there was no need to hurry in telling bad news. And he quietly set to work to get the coffee, remarking as he did so,

"It was very kind of the gentleman to leave a little behind him!"

The coffee having been strained through the linen bag he had made for it, Li filled two cups cut out of ostrich eggs, and went up to Cyprien, who was still asleep.

"Here is your coffee, Pa," said he, touching him on the shoulder.

Cyprien opened his eyes, stretched his limbs, smiled at the Chinaman, drew himself up, and drank the steaming liquor.

It was not till then that he noticed the absence of the Italian.

"Suddenly the cord stretched."

"Where is Pantalacci?" he asked.

"Gone away," answered Li, in the most natural way in the world, as if there was nothing at all unusual in his doing so.

"What! Gone away?"

"Yes, Pa—with the three horses."

Cyprien threw off his rug and gave a glance round, which told him everything.

But he was too proud to show his anxiety or his anger.

"Very well," he said. "The fellow fancies he has seen the last of us, I suppose;" and he walked briskly to and fro, and thought. "We must be off at once," he said to the Chinaman. "We must leave the saddles and bridles, and all that would encumber us, and take only the guns and the food we have left. We may get on quicker unmounted, and perhaps find the shortest roads."

Li hastened to obey. In a few minutes the rugs were rolled up and the bags shouldered, and then all that it was necessary to abandon were heaped together and hidden under a pile of brushwood.

Cyprien was right in supposing that, under certain circumstances, it would be better to travel on foot. He could go a nearer way, and climb heights that a horse was unequal to, but at the cost of what fatigue!

About one o'clock in the afternoon they reached the northern slope of the chain they had been following for three days. According to the information given by Lopepe, they could not be very far from Tonaia's capital. Unfortunately in the Bechuana language the indications were so vague as to the route to follow and the distance, that Cyprien was not sure if he had to travel two days or five days before he reached the kraal.

As he and Li were descending into the first valley, after crossing the ridge, the latter gave a short, sharp laugh.

"Giraffes!" he said.

Cyprien looked below and saw about a score of these animals feeding in the valley. Nothing could be more graceful from afar than their long necks, held upright like masts, or thrust like long serpents into the herbage for two or three yards from their brown-spotted bodies.

"We might catch one of those things to take the place of Templar," observed Li.

"Ride a giraffe! Whoever saw such a thing!" exclaimed Cyprien.

"I do not know if any one ever saw it, but that is no reason why you shouldn't see it," answered the Chinaman. "And so you shall, if you let me try!"

Cyprien, who had begun by thinking it impossible, ended by promising to help.

"We are to leeward of the giraffes," said Li; "that is lucky, for they have very quick noses, and would have smelt us. You go away to the right and frighten them with the report of the gun, so as to drive them this way, and I will look after the rest."

Cyprien dropped on the ground all that could hamper his movements, and hurried off.

Li lost but little time. He ran down the valley and reached a track along the bottom. This was evidently that used by the giraffes, for it was all marked with their hoofs. The Chinaman took up his position behind a large tree. He then unwound his long cord, which he was never without, and, cutting it in two, made two lengths each of about a hundred feet. To one end of each of these he tied a heavy pebble, and the

other ends he hitched to the lower branches of the tree. Then he coiled the free ends over his arm, stepped behind the tree, and waited.

Five minutes had barely elapsed when the report of a gun sounded some distance off. Instantly a swift trampling began, as of a squadron of cavalry at the charge, and this increased from moment to moment, and announced that the giraffes were coming, as Li expected. They came right down on him along the track, little suspecting what was awaiting them.

With their nostrils dilated, their heads bristling, and their tongues hanging out, the giraffes looked really superb, but Li had something else to do than admire them. His post had been judiciously chosen at a narrowing of the way, where the animals could only pass two abreast, and where they would be sure to crowd.

He let two or three go by. Then, picking out one of extraordinary size, he flung his first cord. It whistled as it flew and swung round the victim's neck. Suddenly the cord stretched, squeezed the throat, and pulled the giraffe up short.

The Chinaman lost no time in looking on. Scarcely had he seen his first cord strike than he launched the second, and brought down another giraffe.

All was over in half a minute. The frightened herd escaped in all directions, and two half-strangled giraffes remained prisoners.

"Come on, Pa!" shouted the Chinaman, as Cyprien ran up, rather doubtful of the success of the scheme.

But the evidence was too much for him. There were two magnificent animals, strong, fleshy, with splendid hams and lustrous necks. But Cyprien thought only of admiring them; to ride them did not seem possible.

"How can you hang on a ridge which slopes at thirty degrees?" asked he, with a laugh.

"By sitting on the shoulders, and not on the flanks," answered Li. "Besides, we can roll up a blanket to put under the saddle."

"We have not got a saddle."

"I will soon find you one."

"And what is your bridle to be?"

"You'll see."

The Chinese had a reply for every question, and with him acts and words were not far apart.

The dinner-hour had not arrived before with part of his cord he had made two strong halters, which he slipped over the giraffes. The poor beasts were so frightened at their misfortune, and were, besides, so gentle in disposition, that they made no resistance. The other end of the cord did for reins.

This being finished, nothing was easier than to lead off the prisoners. Cyprien and Li went back to the camp and repossessed themselves of the saddles and other articles they had abandoned.

By the evening everything was arranged. The Chinaman was a marvel of cleverness. Not only did he alter Cyprien's saddle so that it would seat him horizontally on the giraffe, but he made himself a saddle of twigs; and took the precaution of breaking in the giraffes during half the night, mounting first one and then the other, accustoming them to the rein, and teaching them that henceforth they must obey.

(To be continued.)

Muff Brown.

BY ROBERT RICHARDSON, B.A.

WEEK in, week out, straight through the terms,

At the foot of the form he sat,
With his simple face and sandy hair,
And queer eyes like a bat.
And if ever he did get up a place
He was safe to be taken down;
But nobody heeded him, down or up—
He was only old "Muff Brown."

In the playing-fields it was much the same,
We dubbed Sam Brown a flat;
Slow on the river, and slow at the goals,
And no end of a muff with the bat.
Alone about the school-ground Sam
Went mooning up and down,
For none of the fellows cared too much
To chum with old Muff Brown.

Our school days over we scattered far,
Like leaves before the breeze,
And some went east and some went west,
And some beyond the seas.
Some climbed life's ladder rung by rung
And won a fair renown;
Yet never a word had I ever heard
Of how it fared with Brown.

But yesterday in a supplement
Of the "Times" I wondering read
Of a little band through a wild lone land
By one white captain led.
A story of peril and toil and pain,
Of marches long and lonely;
Of a hope forlorn seven months upborne
By the word of that white man only.

Safe to the goal he led them on,
With a heart no fear could daunt,
And the story reads like the magic deeds
In the tales of old romance.
All England rings with one name to-day,
And the victor's shining crown
(It's here as plain as the "Times" can print)
They are giving to old Muff Brown.

WORTH REMEMBERING.

WHATSOEVER you find to do,
Do it, boys, with all your might;
Never be "a little true,"
Or "a little in the right."
Trifles even
Lead to heaven;
Trifles make the life of man;
So in all things,
Great or small things,
Be as THOROUGH as you can.

Let no speck their surface dim,
Spotless truth and honour bright;
I'd not give a fig for him
Who says that *any* lie is white!
He who falters,
Twists or alters
Little atoms when we speak,
May deceive me,
But believe me,
To himself he is a sneak!—Anon.

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXV.

"La carte d'jour, M'sieu."

THE same afternoon Soady was at his coach's, the Rev. P. King's, working hard at French. He was to stay an hour later than usual to have an extra lesson in conversation, which would prevent his looking in at the University on his way home.

He had taken lately to talking French as much as he could, so as to accustom himself to the language. The result was sometimes not very successful.

The evening before, for example, he had gone to a French restaurant for dinner. Not that he liked the French cookery, he was suspicious of it, but he wanted to try whether his conversational powers were improving.

He entered the place boldly, took off his hat to the woman behind the counter in the corner (he knew that was a French custom), and sat down at one of the little tables.

"Garçon?" he ejaculated.

A black-haired little man came running up.

"Etès-vous Français?" asked Soady. He was not going to waste his French on an Italian.

"Oui, m'sieu. La carte d'jour, m'sieu."

This would have floored Soady had not the bill of fare been handed to him at the same time.

"Parles lentement, s'il vous plait," said Soady.

"You talk English, sare?" said the waiter.

"Oui, mais je préfère le Français," returned Soady, studying the bill of fare.

"Bifteak"—evidently beefsteak. "Pommes de terre" he knew were potatoes.

The waiter left him for a moment to attend some one else. Soady manufactured a splendid sentence, which he shot at him on his return.

He was rather satisfied with himself so far, but his pride soon had a fall. Something in his last effort seemed to

call for a reply from the Frenchman, and he proceeded to give it, at the rate of a hundred and twenty words a minute. Soady listened helplessly, and at the end said "Oui, oui!" the result of which was that he found he had pledged himself to a three-shilling table d'hôte, consisting of seven courses of messes, and not one satisfactory square joint amongst them.

He determined that in future he would get his conversational practice somewhere else than at a restaurant.

However, this is a digression. We left him at his coach's.

"I say, Garland," he remarked, as he relapsed for a moment into his mother tongue, "have you seen Lang since you've been in town?"

"No; I don't even know his address."

"I can give you that; we might look him up together one night. I went down to Burlington Gardens yesterday to see him, but missed him. I can't go to-day; do you think you could look him up down there and give him a mental pat on the back? I know how these exams. take it out of one. I always find that the examiners know your weak points by instinct, and go for them straight as a die."

"I'll go down with pleasure," said Garland.

"Tell him I'll come down to-morrow, and when the whole business is over we'll have a little kick-up at my rooms."

"I thought you had forsworn all dissipation," laughed Garland.

"So I have, but I must blow off steam one night a week or I should go off pop."

Garland promised to come. More than that, he went off straight to the University to catch Lang.

Needless to remark, Lang was invisible. Garland thought it odd.

"I suppose he's got through his paper and left early," he said to himself. "Soady missed him yesterday, which implies the same thing then. If he can't occupy his time it doesn't say much for his chance. The inference is that he can't answer the questions."

He was about to turn home, when he saw Fanshawe, walking along poring over some examination papers.

"Wonder if he's seen Lang," thought Garland. "I'll ask him."

He by no means wished to renew acquaintance with Fanshawe, but was ready to risk a simple question.

"How are you, Fanshawe?" he said, as the latter approached.

Fanshawe started violently.

"What's it matter to you?" retorted Fanshawe, angrily. He had received a shock, for he had not seen Soady the previous afternoon, so Garland was the first acquaintance who had "spotted" him at his deception.

"It doesn't matter much, I confess," said Garland, quietly. "Have you seen Lang?"

"Lang? What's Lang to me?" said Fanshawe, with an oath.

"You were something to him," said Garland; "the greatest enemy he ever had."

He turned on his heel and left him to make what he liked of it.

Fanshawe sprang towards him and caught his arm.

"What do you mean?" he demanded. He had a sudden fear lest Garland was aware of the whole affair.

"When you can speak civilly I'll answer you," said Garland.

Fanshawe withdrew his hand.

"Why do you want to see Lang?" he asked.

"I thought he was in for the matric."

"So he is."

"I've missed him, I suppose; it's a pity. Good day."

Garland walked away, and Fanshawe made no effort this time to detain him. It was all right, after all. Garland had no idea of what was up. At the same time he must give Lang a word of warning,

and it would be wise for himself to stay in the examination rooms till every one had gone. It would seem queer for him to be seen coming out three days running, though of course he could say he came to see some friends.

Lang, on his side, was anxious to warn Fanshawe. He wrote him a letter when he reached home that afternoon, telling him that if he saw Soady to-morrow he must explain that he (Lang) had left the exam. early. Thus one lie leads ever to another.

When he had finished his letter a thought struck him and he tore it up. Why should he not be bold and go down himself to the University? Soady could not reach there till four; if he were to be there a little before he could meet Soady as if he had just come out of the examination-room.

The idea was such a good one he wished he had thought of it before.

He carried out his plan next day most successfully. He reached Burlington Gardens at a quarter to four, and came out of the side entrance by the Arcade at four o'clock. There were Soady and Garland waiting for him outside.

"How are you, old boy?" sang out Soady, grasping his hand. "Getting on all right?"

Garland gave him a warm greeting as well.

"Where have you been hiding yourself the last two days after exam.?" asked Soady. "We've both been down to look you up."

Lang gave a slight start. He had hoped that his absence had only been noticed once.

"I came out early; I got through my papers in no time," he explained.

"What sort of Latin paper did you have?" asked Garland.

This was terrible. If he were going to be catechised on the questions he had never seen, it would be all up in no time.

"Pretty easy," he replied. It was imperative to change the conversation. "Where are you living, Garland?" he asked.

"I'm reading with Mr. King; Soady comes there from ten till four. I wish you could join us, we have very jolly times."

"I must try," said Lang. "I'm staying at a boarding-house, but I don't like it much."

"Look here, Lang," burst out Soady; "I'm going to knock off work at nine-thirty to-night, what do you say to coming up to my place and having an hour's jaw?"

"I don't think I can," said Lang, who feared that he would be questioned as to the papers, Soady being anxious to get "posers" in every subject in order to test his progress.

"Oh, bosh! you must come; we won't say a word about exams. the whole time. I expect we're both about sick of them."

"All right, I'll turn up," replied Lang.

"You can't come, Garland, I know, so it's no use asking you. Nine-thirty sharp, Lang."

CHAPTER XXVI.

THERE was a warning note from Fanshawe waiting for Lang when he reached home. There was a P. S. to the note, asking if that five pounds was available.

This was not calculated to raise his spirits; However, he hoped to rouse

himself at Soady's. He had the address this time.

He turned up punctually, was shown to Soady's room, and knocked.

"Come in," shouted Soady.

Lang entered; Soady leaped up, shut up his dictionary with a bang that shook the place, and seized Lang's hand.

"I'm right glad you've come. I should have gone mad over a bit of Horace in two minutes more. Shy your hat over there."

Lang stared at him.

"Why, what on earth's come to you?" he asked.

Soady laughed.

"Don't be frightened; this is my student's attire."

He was certainly a strange-looking object. He had on a long flowered dressing-gown, and his head was ornamented with a soft white bathing towel, tied round like a turban.

"It's wet," he explained. "It keeps your head clear and prevents headaches. All the senior wranglers used to wear wet towels round their heads. Will you have one?"

"No, thanks," said Lang, laughing. It was the first time he had laughed for many a day.

"Pull up your chair to the fire. Now, how do you get on at your boarding-house? Decent people?"

"Yes, but I don't see much of them."

"Any music?"

"Yes, some of them play very well."

"Ah, I should like that," said Soady. "The worst of this crib is there's no piano. Perhaps it's a good job, though; I should waste my time at it if there were."

"You must get one if you pass."

"You bet your life I shall. But I haven't given up music altogether. I give myself a quarter of an hour at it every evening."

"What sort?"

"Singing. Look here; I've got three songs I'm learning."

He produced his music and handed it to Lang.

"Listen," he said; "this is an awfully jolly one: 'Floating down the silent stream.'"

He stood up, with his music stretched well out, and commenced to sing the sentimental ballad in a voice of thunder. He had not got half way through the first verse when there came an unearthly wail from just outside the window.

Soady stopped instantly.

"That's Caractacus!" he said, mysteriously.

"Who's he?" asked Lang.

"He's the cat belonging to an old lady next door. He always comes out and squalls when I want to be quiet. We'll fix him to-night."

Lang wondered what was going to happen. Soady went on tiptoe to a cupboard and began searching for something.

"That beast is the bane of my existence," he went on. "Whenever I've anything special to do he comes out on the roof of the conservatory under my window, and tunes up like you heard him. Isn't it enough to make a skeleton turn in his grave?"

Lang took a peep at the obnoxious animal, which was seated on the top of the greenhouse belonging to No. 15A. Every now and then a doleful wail proved that his lungs were in good order in spite of the effects of the night air.

"Keep steady, don't frighten him," said Soady, who had found what he was looking for.

"What have you got there?"

"A cracker. It's time to take serious measures to check Caractacus's trespassing. I've tried the effect of marbles inside mustard tins, but he's got accustomed to them. Let's see how he likes this."

He softly opened the window. Lang handed him a match, with which he lighted the twist of paper at the end of the cracker, then he dropped it on to the greenhouse roof.

A moment afterwards there was a bang, followed by a yell; Caractacus leapt to the top of the wall, and stood with back erect. Soady was trying to add to the effect by various noises, which, combined with the cracker, sent Caractacus nearly frantic. Then a window on the ground floor of the next house opened hurriedly, and a woman put her head out. She gave a shriek as she caught sight of Soady's turbaned head as he leaned out of the window, flourishing his arms like a windmill.

"I'll have the law of you, young man," she screamed. She had no time to say more, for Caractacus, mad with terror at the pursuing cracker, took a flying leap into the open window. There was a crash as of broken glass, followed by a scream; then came silence.

Soady drew in his head.

"I hope I've settled his hash for ever," he remarked, complacently. "He'll have to do his serenading on some other roof in future."

"The old lady next door seems to resent

your interference with the habits of her pet," said Lang.

"Let her," returned Soady. "I haven't the ghost of consideration for her. She pets up that wretched cat and treats it as if it were a human being. Mrs. Smith, that's my landlady, had a fine old Tom when I came here, that gave Caractacus pepper one day. That sweet creature next door poisoned Mrs. Smith's Tom next day out of revenge, so I don't feel much compunction on the score of a cracker or two in the rear of Caractacus."

They shut the window down, for it was cold, and drew up to the fire. Ten o'clock soon struck.

"I say, Lang," said Soady, "this is rather different from St. Mary's, isn't it? No one to drive you to bed now, and be down on you like a ton of bricks if you don't show up at prayers."

"I'm jolly glad for one I'm out of that place," said Lang. "It will be much better in London."

"Rather, and I've got lots of friends about, only I'm keeping dark at present, or I should get going out too much. If I pass this exam, we'll have splendid times together. Then there's Garland, too; he is just the sort of fellow I like, though he's quieter now naturally."

"Why naturally?"

"You see he's going in for the Church. He had a talk with me the other day. He was doubtful whether he ought to be a parson, thought he wasn't good enough. I told him that if he didn't know his Hebrew yet he knew how to be a kind and honourable fellow, and that was something to begin with. But he's rather serious just now: he says it's an anxious

time. He'll come all right by-and-bye though, and be the best parson you ever saw."

"I should think he'll make a good preacher," said Lang.

"Perhaps; but at any rate he'll be a good man, and that's more important. Isn't he just the sort of man to get a fellow to own up anything wrong and to put him right again? Eh?"

Lang assented mechanically.

"You remember at St. Mary's how many quarrels he made up, and how the new youngsters used to take to him? Why if I were queen I'd make him archbishop straight off."

A little more talk and Lang rose to go. Soady saw him off the premises, and then returned for half an hour's more work.

Lang walked moodily home. How he envied Soady, with no greater care on his mind than how to quiet a cat and pass his exam. successfully.

Was it too late for him? Yes, too late. He was too much entangled in the net. As far as he could see there was no way of escape, and now that his money was gone he was in a worse plight than ever. He half envied Melhuish, who at all events was safe from the prying eyes of his relations and friends.

If only he could tell some one the whole wretched story and ease his soul by confessing! But whom could he confide in? Garland? He was too ashamed of himself to let him know. He still valued Garland's good opinion; to lose that would be to lose one of the few things that kept him from going utterly to the bad.

(To be continued.)

CANOES, AND HOW TO BUILD THEM.

By C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER IX.—ON CENTREBOARDS.

WE have seen that in order to use the sails in a sailing vessel to the best effect some form of lateral resistance is absolutely necessary, and we have also seen that in a canoe the centreboard is the most handy form in which such resistance can be given. The next question will naturally be, What is the best form of centreboard to use?

This, however, is a question that cannot be answered offhand, as the peculiar form of the particular boat in question must be studied, and also the uses to which it is intended to put her. Thus, a canoe of very shallow draft, and with little or no rise in her floor, will require a larger board than one with more rise and greater depth; and again, there is no doubt that one centreboard amidships is easier to construct than two, one fore and the other aft, but the former system encumbers the most useful part of the canoe, and greatly interferes with the comfort of the occupant.

With a canoe carrying only a moderate sail plan a light centreboard answers very well while one intended to carry a large sail area will necessitate the use of a heavy centreplate as well as shifting ballast. Again, it will be found most convenient as a rule to have the centreboard a fixture, but in isolated cases it will be found more handy to have it so constructed as to be easily removable without the necessity of hauling the canoe ashore. Such points as these must therefore be appreciated before the centreboards are constructed, and in the plan the position of

intended bulkheads, etc., must be so arranged as to allow the board to be placed in the required position. Proper means must also be thought of for hauling up the centreboard when required. An ordinary small board of light weight will require no special appliance for raising it, as a piece of light chain will be amply sufficient with a strong cord attached for a hauling part; but with a large and heavy plate some better purchase will be required, and for this a short piece of chain can be attached to the centreboard just long enough to leave a part of the chain on deck when the board is down to its full extent.

This chain may terminate in a ring just large enough in diameter to prevent it going down the well of the centreboard; to such ring a pulley can be attached, and a strong line, one end of which is fastened sufficiently far aft, being led through the pulley, the hauling part of the line goes aft to the well, the line being left long enough to enable the crew to use it with ease. If the line is passed into a small fairlead in the deck just in reach of the occupant's hand, and the end of the line is so knotted, or otherwise arranged as to stop it from passing forward through the fairlead, it will be always at hand for use, and if a cleat is placed next the fairlead the line can be made fast immediately as required.

The knot in the line must be made when the centreboard is fully down. By this arrangement the line is always at hand for use, and is never in danger of getting loose

and entangled, and it also affords a powerful purchase to help in lifting the plate.

With a heavy centreboard it is advisable to use an indiarubber spring of sufficient strength to take the greater part of the weight of the board or plate. The fitting of this spring has been described in a previous article.

In the plan of the canoe shown at Fig. 1 you will see that only one centre-plate is used (which is shown hauled up), and this plate is placed extremely forward; this is necessitated by the form of the canoe, which has a great deal of drag aft given by the amount of dead wood there. This immersed surface gives sufficient resistance aft to enable the canoe to carry her sails to advantage, but without a centreboard forward she would be likely to fall off from her shallow draft forward, besides being unsteady on her helm. This only applies when on the wind, as when her sheets are eased off the forward board would be hauled up as having a tendency to make her steer wild, besides offering unnecessary resistance. Such a form of canoe is an extreme one, and being very difficult to build and having few advantages when built, is a design that it would be unwise to imitate; sufficient lateral resistance could be given in a simpler form by making a canoe whose body should draw little more aft than forward; the immersed area thus cut away could be given in a centreboard placed aft. With two centreboards the boat would be far handier, as by pulling up the fore board when on a wind the boat would immediately fall

off, and when off the wind by letting go the forward board and hauling up the after one the boat could immediately fly up into the

Another style of centre-plate is shown in Fig. 3. It is a very simple form and can be pivoted either from the top or bottom or left

board. The strongest way to fit this case is to let it run from the keel B up to the deck B, thus securing great strength, for nothing

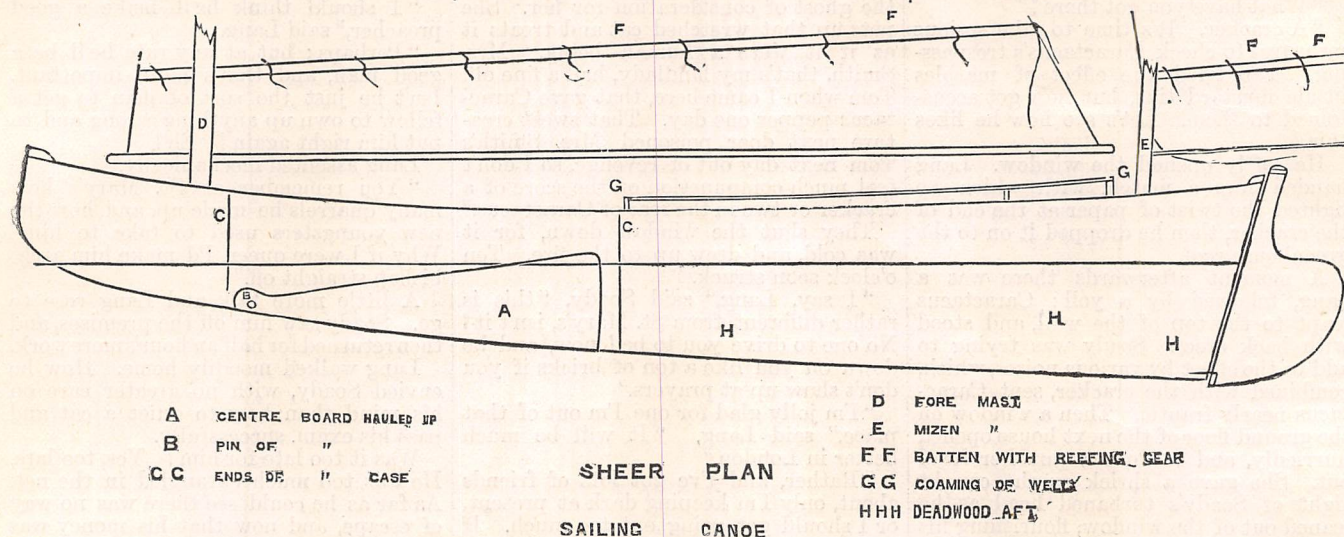

Fig. 1.

wind. The dagger form of board is shown in the article on the sharpie; this style of board is useful where it is desired to haul the plate completely out on occasions without trouble.

B B Side of Case. Black line indicates the Centreboard.

BODY PLAN

Fig. 2.

movable as in the case of the dagger board. Enough has been said on the article on the sharpie to impress on you the necessity of making a strong and watertight fit of the centreboard case, which is slightly longer than the centreboard, and is constructed of two sides and the ends well put together by screws or rivets and the joints red-leaded and made watertight (see notes on the sharpie). The centreboard in English boats is generally pivoted at the bottom, as in Fig. 1, but if it is easier to fit you may pivot it at the top as in Fig. 3; the latter way is the best for removing the board if necessary; the ends of the case are shown A A, Fig. 3, and

needs strength and good fitting more than a centreboard case, which, particularly in a heavy boat, after a time will generally become a source of leakage.

The centreboard is generally made of iron (boiler-plate is very good); after being fitted it is galvanised, but in fitting you must not forget that the galvanising will increase slightly the thickness of the plate. In American boats wooden centreboards are sometimes used. The centreboards are of very different forms, as Figs. 1, 2, 3. Fig 1 is the common form; Fig. 3 is a very useful form, as it is easily made and is effective. Fig. 2 is called the dagger or

Fig. 3.

the sides at Fig. 2, where B B is the centreboard. Two centreboards are sometimes fitted; the advantage is that this arrangement leaves the centre portion of the boat entirely free, which is very much more agreeable to the occupant. The fore centreboard is placed just aft of the fore mast, which is stepped well forward, and the after board is placed just behind the mizen mast right aft.

In constructing a boat of any kind for a centreboard the keel ought either to be made in two pieces (see Fig. 2) or of an extra width to admit of fitting the case for the

sword centreboard, and is American in design; it can be lifted right out of the boat. It is used generally in small boats, such as the design given in Fig. 2, which is a flat-bottomed boat of the sharpie type. The American boat that crossed the Atlantic of this build, had no centreboard. The American sneak boat is of the same type but smaller. The sharpie is perhaps the most easily built of any, and I should advise you to try your hand at one if you have not had much experience in boat-building.

(To be continued.)

OUR PRIZE COMPETITIONS.

(SEVENTH SERIES.)

V.—“A Story Needing Words.”

In our first volume, it may be remembered, we sought to train and encourage our readers in composition by offering various prizes for the best story written up to suggestive engravings. These literary tournaments proved very popular, and we have reason to know did not a little good in inducing thought and effort.

This week we print on page 280 another prize essay subject; and it may give additional interest to it if we mention the fact that this drawing has been made for us by one, now beyond the age at which our readers may compete, and already winning honours as a professional artist, who narrowly missed a prize and carried off a certificate in the Tournament drawing competition in one of our earlier numbers. Nor is he the only one we could mention who, beginning with our competitions, is now engaged in professional life.

For this “Story Needing Words” we offer *Three Prizes, of One Guinea and a Half, One Guinea, and Half-a-Guinea* respectively, for the best story founded on the picture. Competitors will be divided into three classes, according to age, and one Prize will be awarded in each class. First class, from 18 to 24; second class, from 14 to 18; third class, all ages up to 14. The highest Prize will go to the class showing the greatest merit.

The last date for sending in is May 30th.

Competitors must write on one side of the paper only, and no story should exceed in length half a page of the *Boy's Own Paper*. In addition to the prizes, handsome “Certificates of Merit,” suitable for framing, signed by the Editor, will be awarded to all the more meritorious competitors who may fail to secure prizes.

The work must in every case be the competitor's own—that is, must be the product of his own hand and brain; though of course any aids received merely in the way of suggestion, whether from books or friends, are admissible.

All MSS. must have at the top of first page the full name, address, and age of sender, clearly and legibly written, thus:—

Name.....
Address.....
Age.....

All contributions should be certified by parent, clergyman, minister, teacher, employer, or other responsible person, as genuine unaided work. By this certificate we simply mean a letter, or even an endorsement under the competitor's name, thus:—“I hereby certify that the accompanying article is the unaided work of —.” Signed —.

All letters or packets must be plainly marked outside “Prize Competition, Class —,” and must be addressed to “The Editor, *Boy's Own Paper*, 56, Paternoster Row, London,” carriage being, of course, prepaid. Nothing can be returned, whether accompanied by stamps or not, and no answers or acknowledgments of any kind can be sent through the post. For the general “rules,” etc., in all our competitions, refer to page 15 of the present volume.

A page from history!

HISTORICAL GHOSTS.

IN the year 1820 a mysterious murder was committed at Southam. No clue was at first found to the perpetrator of the crime. Eventually, however, a certain person living in the neighbourhood declared that the ghost of the murdered man had appeared to him and told him the name of the murderer. The information was conveyed to the proper authorities, and the man accused by the ghost was arrested. The magistrates were satisfied with the evidence and committed the prisoner for trial at the Warwick Assizes.

Chief Justice Randolph sat to try the case, and as soon as the man began to relate what the ghost had told him, the judge pulled him up short with,

"Stop! That is only hearsay evidence!"

The counsel for the prosecution was staggered. In vain he asked for the case to go

on. The judge informed him that he might call the ghost if he pleased, but that he would not allow the witness to give second-hand information. The counsel agreed for the ghost to be summoned, and the judge very gravely ordered the usher to call it in the usual manner. This was done three times in all due form. The ghost did not appear.

The judge dismissed the case with a censure on the magistrate for such a committal, and noticing how uncomfortable the witness had looked while the ghost was being called, he directed that gentleman to be carefully watched. The result was that fresh evidence was found, and at the next assizes the witness was put on his trial for the murder. He was convicted, confessed, and was hanged.

This is a very fair specimen of one class of ghost story. As a sample of another kind, in which a man lived for years under the impression that he had actually seen a ghost, we may take that of the young fellow who to frighten his companions dressed himself up in the usual sheet and hied to the churchyard to be ready for them when they approached. At the

time he had rigged himself out for the adventure, and was crossing the churchyard to take up his post, a gentleman happened to be making a short cut through it on the way to visit his future wife. He caught sight of the ghostly figure moving among the tombs, and was at first somewhat scared, but noticing that its step was firm, and that as it hurried over a path it wore trousers and hobnail boots, he uttered a tremendous howl and gave chase. The poor ghost fled like the wind, scrambled up the churchyard wall, and fell sprawling into the brook that flowed beside it, while the lover, satisfied that he had frightened it off the premises, and ignorant that it had hurt itself, resumed his way to see his young lady.

The young man's terror was extreme. He was picked up by his companions as they came along and brought home, and often told the story as a warning to others of how when he went to play the ghost he had seen and heard a real spirit. In fact he died many years afterwards without knowing the real state of the case,

and it was only the day he was buried that the gentleman by chance happened to be passing through the town, and hearing the story, gave his version of it, and cleared up the mystery.

One of the commonest descriptions of ghost stories is where a friend or relative appears "the very moment" he dies in a distant land. Of these stories by far the greater proportion ignominiously collapse when the difference between local time and Greenwich time is taken into account. In a good many instances it will be found that the ghost puts in an appearance several hours before the death occurred, and in the others several hours afterwards. In fact the ghosts of the future are likely to be considerably indebted to the Prime Meridian Conference at Washington for having persuaded the world at large to adopt "Greenwich mean."

In another kind of ghost story there is no apparition, but the spirit is shown by sound or damage. Of the first variety the famous Cock Lane Ghost is an example, where a servant girl by scratching a board in bed endeavoured to convict an innocent person of murder, and persuaded a good many worthy people that they were in communication with a disembodied spirit.

Of the damage class the Woodstock Ghost may be quoted. Here John Collins, otherwise Funny Joe, attended the Commissioners of the Long Parliament who came down to dispark that royal residence; and he led them the most unsettled life imaginable. Under the name of Sharp he had been appointed one of their clerks. He was a concealed loyalist, and thoroughly acquainted with all the ins and outs of the mansion. He saw more extraordinary sights and visions than all the rest of the party. "Their bedchambers were infested with visits of a thing resembling a dog, but which came and passed as mere earthly dogs cannot do. Logs of wood, the remains of a very large tree, which they had splintered into billets for burning, were tossed about the house, and the chairs displaced and shuffled about. While they were in bed the feet of their couches were lifted higher than their heads, and then dropped with violence. Trenchers without a wish flew at their heads of free will. Thunder and lightning came next, which were set down to the same cause. Spectres made their appearance, as they thought, in different shapes, and one of the party saw the apparition of a hoof, which kicked a candlestick and lighted candle into the middle of the room, and then politely scratched on the red snuff to extinguish it." Other and worse tricks were practised on the poor Commissioners, and at last they fled from the spot in despair.

The Stockwell Ghost is another example of the same kind. On Twelfth Day, 1772, the crockery of a Mrs. Golding living in that neighbourhood began to fly about in a most wonderful manner. Plates and dishes whizzed through the kitchen most alarmingly, and the smashing became so great that the old lady was in despair. Her maid looked on apparently unmoved, and exhorted her mistress to be patient; but when her best set of china had gone all but two cups the worthy matron moved off hurriedly to visit a friend.

At last the maid was dismissed, and the ghost went with her, for it afterwards turned

out that she had tied horsehair to the plates and dishes and pulled them off the hooks, set them on wires and shaken them down, untied the hams and bacon sides so that the least movement would dislodge them, and, in fact, amused herself hugely at her mistress's expense owing to there being "no followers allowed."

In Sir Walter Scott's "Demonology" is an excellent example of another class of ghost story, where the appearance was real and the man, as has often happened, was taken for his own ghost. At Plymouth a literary and scientific club used to meet whose members presided alternately. On one occasion the president of the evening was reported to be very ill and on his deathbed, and out of respect to him the chair was left vacant. While the members were talking about the sick man the door suddenly opened and the appearance of the president entered the room.

He wore a white wrapper, a nightcap round his brow, and his face was that of death itself. He stalked in with unusual gravity, took the vacant place of ceremony, lifted the empty glass which stood before him, bowed around, and put it to his lips. Then he replaced it on the table and stalked out of the room as silent as he had entered it. The company were terror-stricken, and deputed two of their number to see how it fared with the president who had thus strangely appeared amongst them. They found that he had died that evening!

The explanation of the mystery was discovered a few years afterwards. The nurse of the sick man told the story on her deathbed. She had slept when she should have been watching her light-headed patient, and when she awoke the bed was empty, and he had gone. She hurried out of the house to seek him, and found him coming back, and only got him into bed to die. The delirious patient had taken the road to the club from some recollection of his duty of the night, and had gone there and back by the most direct route. The two who were sent to inquire had gone round by the road, and hence the president had had time to get back and die before they reached his house.

A good many ghost stories are due to reflection—or perhaps we should say the want of reflection. In our articles on mirror magic and other popular optics, we have shown what wonderful deceptions have been caused by mirrors and lenses, and the powers they possess are, with certain degrees, shared by the watery vapour in the air. The spectre on the Brocken is a case in point, where the figures of the spectators are thrown forward and magnified on the mist.

All the ghosts of armies and battle-fields are due to this principle. Horses and cattle feeding on a hill have been multiplied and magnified until the imagination has been persuaded that a battle was in progress below. In all mountainous districts we have wholesale ghosts of this character. Perhaps the most famous of them is the Edgehill story, where the people gathered near the Round House saw the battle fought over again night after night, with the sound of the guns, the shouts of the combatants, and the groans of the wounded, and were so persistent in their assertions that Charles I. sent Colonel Nugent to investigate and—as it turned out—partially confirm it.

The times of Charles I. are peculiarly pro-

lific in ghost stories. The picturesque costume of the period is admirably suited to the purpose, and even immaterial characters must be appropriately dressed. Family ghosts must be of respectable age to be believed in, and must at least date back to Caroline times if they are to confer any credit on their descendants.

One kind of ghost—the gallery ghost—is very common. Pictures are said to become endowed with life and walk out of their frames, while the rest of the family portraits look on and follow with their eyes the terror-stricken ghost-seer. Such ghosts are but exaggerated compliments to the painter. The walking out of the frames is a testimony to the life-like attitude of the portrait, and the apparent movement of the eyes is due to the fact that the face has been properly painted. Let the experiment be tried with any good portrait, and it will be found that by sunlight, as well as by candlelight, lamplight, moonlight, and starlight, the eyes will seem to look at you from whatever position you look at them. This holds good with all full-faced heads, and as we had practically no proper portrait painters before Jamesone and Vandyck, so we get no peripatetic or inquisitive oil canvases of earlier date than theirs.

A good many of the graveyard ghosts are due to sextons and similar people following their ordinary occupation amongst the tombs. Some of them belong to a sadder class—the visits of the bereaved to weep over the grave of the departed. Of the sexton type we have that excellent story of the man who, passing by the church at dead of night, beheld a mysterious light streaming up from the ground, and heard a ghastly "thud, thud!" go every now and then in a most alarming fashion. Being a man of strong nerves, he made his way into the churchyard and found the noise was due to a sexton digging a grave ready for the early morning, and that the light came from his lantern.

Sound has had a good deal more to do with ghost stories than sense. In fact, more tales have been told about what has been heard than what has been seen, and in the majority of instances the noise has been eventually explained. We have the trees and the creepers, and the birds beating against the window pane. We have the wall-paper blown by the wind, and the mutton-bone nibbled by mice beneath the piano; and we have the ginger-nuts in the boy's coat-pocket going "patter, patter!" as he ran down the steps of the haunted tower, increasing his speed and his terror with every bound against the stone. But perhaps the best-known story of this kind is that of the Fakenham Ghost, so well told by Robert Bloomfield.

Still on, pat, pat, the goblin went,
As it had done before!
Her strength and resolution spent,
She fainted at the door.
Out came her husband much surprised;
Out came her daughter dear;
Good-natured souls! all unadvised
Of what they had to fear.

The candle's gleam pierced through the night,
Some short space o'er the green;
And there the little trotting sprite
Distinctly might be seen.
An ass's foal had lost its dam
Within the spacious park,
And simple as a playful lamb,
Had followed in the dark.

OUR BISHOPS AND BISHOPRICS.

(Continued from page 271.)

KENT was the first Christian kingdom; curiously enough Sussex adjoining it was the last. The faith had to make the circuit of the island before the South Saxons surrendered. Sebehrht, king of the East Saxons, received a bishop in his subject city of London. Rædwald to the north of him resolved to hold the balance level and serve his God according to the religion of his forefathers and the religion of his neighbour, and notwithstanding this curious decision Rædwald proved after Æthelberht to be the next great helper of the new faith.

For now again we take up the story of King Edwin. Æthelfrith prospered exceedingly and became the chief monarch of the north. In 607 he fought and won the battle of Chester, where the Britons for the last time appeared as a nation. Two thousand monks were on the Christian side praying for victory.

"Bear they arms or no," said the Northumbrian king, "they war against us when they cry against us to their God."

And the monks were cut down and the Britons dispersed to fight henceforth merely as separate tribes.

In addition to his victory over the Welsh, Æthelfrith had conquered the Scots at the battle in Liddesdale, and was at the head of a powerful host when he met his fate at the hands of the cautious Rædwald.

Edwin had taken refuge in East Anglia, and Æthelfrith hearing of it demanded his surrender. Rædwald refused at first to deliver him up, and then was on the point of yielding when the queen interfered, and he resolved to fight for his guest. The night that he did so Edwin had gone out of the king's house for fear of being killed, and the legend runs that a stranger appeared to him and foretold that he should be a mightier king than any of his forefathers, and that a man should come to him who would tell him of a new life and a new law better than any his fathers had known. Edwin promised to believe in and obey all that would be then told him. The stranger gave him a sign by which he should know when the time had come, and thereupon vanished.

Rædwald gathered his men and marched north, and near Retford on the Idle the battle was fought, and Æthelfrith was killed. Edwin became King of Northumbria; Rædwald was our fourth Bretwalda, Edwin our fifth. Edwin conquered the Welsh, captured the Isle of Man, and took possession of the other Mona off the coast of Carnarvonshire, which ever since has borne the name of Anglesey, or the Isle of the English. He also turned his arms against the Scots, and founded the city on the Forth which still bears his name—Edwinesburgh (Edinburgh).

Æthelberht had died, and Edwin sent to Kent to seek his daughter Æthelburh—better known as St. Ethelburga—in marriage. Eadwald consented for his sister to go on condition that she should not revert to paganism. With her to the north went Paulinus, who was consecrated bishop by Justus, a successor of Augustine in the see of Canterbury.

Gradually the King's mind was changed. He had a narrow escape from assassination, and one day Paulinus came to him, laid his hand on his head, and asked him if he knew the sign. Then Edwin recognised the bishop as the man he had seen outside Rædwald's house, and henceforth became a Christian.

He built a wooden church for Paulinus in the city of York, and was baptized in it on the 12th of April, 627. Six years afterwards he began to build the cathedral of stone, which Oswald, his sister's son—the sixth Bretwalda—afterwards finished. And thus by Augustine at Canterbury and Paulinus at York were the chief sees of the English founded.

The conversion of the people formed an interesting contrast to the conversion of the Britons. The race swept back by our forefathers into the hills of the north and west was nominally a Christian one. It had a fairly organised church, with several bishoprics, and of these the chief were London, York, Caerleon, and Llandaff, all founded about 180.

The early missionaries were the legionaries, and the conversion of the Britons was made from the Roman camps. Hence the old British Church was of the continental type, where the bishop was bishop of a city; the converts were chiefly the citizens, and the dwellers in fields and woods—the countrymen or "pagani"—remained in their old religion, and retained their name of pagans, the word receiving the additional signification of an unbeliever in the Saviour.

The English, socially and politically, have always been a peculiar people; and even in their church, where uniformity would most be looked for, they managed to differ from their neighbours. The British bishops were bishops of great towns, the English bishops were bishops of tribes and districts. In fact the first of them were really the chaplains of the kings, just as in after years the chaplains of the nobles became our parish priests. The kingdom gave its boundaries to the diocese, the manor gave its boundaries to the parish.

Realms long forgotten are still traceable in the limits of existing sees. The old kingdom of West Kent lives in Rochester, the old frontier of Mercia was, till lately, the boundary-line of Lichfield.

Many of the early dioceses thus fixed their headquarters in out-of-the-way places, and it was not until after the Conquest that, thanks to Lanfranc, the bishops began to leave the villages and follow the continental example of settling in the towns. It was then that the sees of Devonshire and Cornwall were removed to Exeter; that Hermann moved Sherborne and Ramsbury to the hill fortress of Old Sarum, for Poore to move it afterwards to the river bank, as told in our sketches of the cathedrals in our part for last April; that Stigand the Little brought Selsey to Chichester; that Peter took Lichfield to Chester for his successor, Robert of Livesey, to take it on again to Coventry; that John of Tours took Wells to Bath; that Remigius, the dwarf in stature but giant in soul, took Dorchester to Lincoln; and that Herfast took Elmham to Thetford for Herbert Losinga to move it on again to Norwich.

And many other places, now insignificant, have lost their bishops—among them Dunwich, Lindisfarne, Hexham, Lindsey, Chester-le-Street, and Wilton. The districts of the Church have indeed been constantly changing; even Westminster and Leicester were at one time bishops' sees.

To Theodorice of Tarsus the old English Church owed much of its organisation. He it was who was sent over here in 668 to definitely arrange the dioceses. The great organiser after the Conquest was Lanfranc, and he, as we have hinted, did his utmost to reduce the National Church to the narrower lines of the continental model.

(THE END.)

CHESS.

(Continued from page 221.)

Problem No. 92.

Black to play, and mate in four (4) moves.

NOTES.

(a)—A useless attack.

(b)—If 9, Kt-B 3, K-R sq. 10, P-K R 3, B-R 4. 11, P-K Kt 4, R-K Kt sq. 12, K-R 2, B-Kt P. 13, P-B, R-P. 14, R-K Kt sq., P-K R 4. 15, B-P, Q-B 3. 16, B-P, R-R 5 (ch.). 17, K-Kt 2, R-B 18, K-B sq., R-K B sq., and Black wins. —A better continuation would have been 9, P-K R 3, B-Kt. 10, Q-B, Kt-Q 5. 11, Q-Q sq., K-R sq. 12, K-R sq. or P-Q B 3, etc.

(c)—White has now no means to save the game.

(d)—If 16, Q Kt-B 3, then B-K 3 threatening to win the Q with R-R 3. If now 17, B-B, then P-B. 18, Kt-Q 2, Black gives mate in four moves. If 16, K-R sq., R-P 17, Q-B 3, R-Kt 8 (ch.). 18, K-R 2, R-R, and Black wins.

(e)—Kt-Q 5 would have been equally effective.

CORRESPONDENCE

A READER OF THE "B. O. P." FROM ITS BIRTH. - Hornblende, felspar, and mica would form a syenite; quartz, felspar, and mica form typical granite. There are no such things as carclerzite and the other zyte—the words must have been misprinted. Hornblende is so variable that it is difficult to give a formula unless you are satisfied to have one with R in it, where R represents differing proportions of lime, magnesia, protoxide of iron, and protoxide of manganese. The best definition is perhaps that hornblende is a bisilicate of various protoxides and peroxides. It is the name of a group more than of a particular mineral. The typical hornblende crystallises on the oblique system, has a hardness of from 5 to 6, and a specific gravity of from 2.9 to 3.4. Quartz is pure silica; mica is—well, better get Rutley's "Rocks," or Bristow's "Glossary of Mineralogy," both published by Longmans.

A. TURTON.—In the March and April parts for 1883 you will find illustrated articles on Cage and Hutch Making. There is no other treatise on the subject.

S. N. S.—The principle on which the earth is weighed is that the force of attraction exercised by certain bodies of known dimensions is first ascertained, and then, the size of the earth and its attractive force being known, a rule-of-three sum gives the result. Thus, as the size of the earth is to that of the body tested, so will be its attractive power if the specific densities are the same, attraction being proportional to density. Mr. Bailey, after two thousand experiments, found the earth to have a density of 5.67 times that of water, and the weight of a spheroid of water the size of the earth multiplied by 5.67 gave him the number of tons you have seen quoted.

CHEYNE.—The degree of M.A. can be conferred by Oxford, Cambridge, London, Manchester, and other universities qualified to grant degrees. For the curriculum you had better consult the calendar of the university you think of choosing. The London degree ranks as high as any, and is less costly than most of the others. The course of examinations for it are, however, proportionately difficult.

T. S. E.—To powder zinc you melt it and pour it into a dry and warm cast-iron mortar. As soon as it shows signs of solidifying pulverise it with the pestle.

J. H. FLETCHER.—We never recommend particular machines. The make you name is not unknown, but it has not a really first-class reputation. The nutted spokes are the best. Your poultry experience has been so satisfactory that we beg to quote from your letter for the encouragement of others:—"Having received such valuable information from Vol. IV. concerning fowls, I wish to thank both you and the author, on behalf of my parents, for the articles contained therein. Our fowls are among the finest in the neighbourhood, and, as for being healthy and clean, we have no trouble with them. We have two houses, each five feet square, and each has a covered run sixteen feet long and five feet wide, besides outside runs, which are eleven yards by six each; we have also two grass runs, all of which father and myself have arranged according to the instructions contained in your paper. Each house and run is cleaned out every morning, and fine ashes laid down, which makes it look quite tidy. We have fourteen fowls in each house, and they do not seem to be at all crowded."

A. E. P.—From the South Australian Government Offices, Westminster Buildings, Victoria Street, S.W.

C.—The description was that of a boat for model sailing. More sail aloft forward does not necessarily mean more speed. You have spoilt the whole sail plan by cutting the jib into two and adding the huge flying-jib, which is quite useless. The foretopsail-yard is too much by the fore. A jib-header on the foremast would be more serviceable. Refer to our articles in second volume for dimensions.

H. H.—Powder up an egg-shell into fine dust, and then mix it into a paste with isinglass and brandy. Oil your mould, pour in your mixture, and when it is set you "will have made artificial ivory."

ERNEST and SEBERT.—The early history of the games has been given. See "Cricket, and how to excel in it," in the second volume, and "Medieval Football" in the third.

C. H. C.—1. The best marble used by the Greeks and Romans came from Mount Marpessa, in the Island of Paros, in the Ægean. That from Pentelicus and Hymettus, near Athens, was next in quality. 2. The Nummulate of the limestone is Nummulites gizehensis. 3. A bovistrehedon inscription is one that reads alternately from left to right and right to left, and is so called from the course taken by oxen in ploughing a field—up one furrow and down the next.

G. H. F.—You will find model yachts advertised in "The Model Yachtsman," price one penny monthly, obtainable from Marlborough and Co., Old Bailey.

H. G. J.—Apply at one of the electrical schools; but you will not become an apprentice without a premium, unless under very exceptional circumstances. Your best plan would be to work at the practical part of your profession during the day, and study the theory at some such classes as those at the Birkbeck Institution during the evening.

E. F. B. G.—The telegraph alphabets, single needle and dot and dash, were given in the part for June, 1884.

A. WOULD-BE MIDDY.—1. "Is it possible to transplant a hair from your head to your arm, so that it will grow there? When I say transplant, I mean to make a little hole in your arm with a needle, to pull out a hair from your head, and to put the root into the hole." We have never heard of this being done, but you could easily experiment for yourself. A single specimen would hardly be a fair test, so perhaps it would be as well to prod yourself over with two or three dozen needle-holes! 2. Midshipman, so called from being originally berthed amidships.

THE CONSTANT READER.—The Secretary, Royal Veterinary College, Great College Street, Camden Town, N.W.

FIDTLER.—You should consult an oculist, and wear the spectacles he advises. Do not act on the recommendation of an ordinary optician or spectacle-seller, as you will then probably get a pair of glasses that will do you more harm than good. Always be careful with the treatment of your eyes.

P. H. TAYLOR.—All large engineering firms take apprentices. You can do nothing without an introduction. Consult the Post Office Directory.

TOM.—Through the portals of your imagination. The rank of ensign has been abolished for years, and there are no means by which you can attain it. You must pass through Sandhurst. Your first commission will be as Lieutenant.

RUSSAR.—The pamphlet you allude to is that we invariably mention in these columns when applied to for information as to how to enter the army. It is official, and obtainable at all principal post-offices, or it will be sent direct from the Horse Guards on application.

No. 317.—Vol. VII.

IVAN DOBROFF: A RUSSIAN STORY.

By PROFESSOR J. F. HODGETTS,

Late Examiner in the University of Moscow, Professor in the Russian Imperial College of Practical Science,

Author of "Harold, the Boy Earl," etc.

CHAPTER X.—THE GYMNASIUM.

NOTHING is perfect in this world—at least, nothing that is of human invention. But perhaps the nearest approach to perfection is to be found in the Russian system of State education.

In each large town there are as many high schools as the governing powers deem adequate to the wants of the population. Each Gymnasium has eight classes, of which the first is the lowest or

most elementary. Every boy is therefore supposed to pass eight years in school before he can be admitted a student at the university. But sometimes, nay, very often, it happens that a

"Arrest him at all hazard. I must have him."

boy fails in an examination or two, in which case he has to stop another year in the class. Hence cases arise where boys have been *sixteen years at school* before they become students. A clever boy will get through in eight years, but the average seems about ten.

Each Gymnasium takes a certain number of gratis pupils, whose uniform, books, etc., are all found by the State. The uniform is like that of our policemen, only the tunic is of a much lighter blue; the buttons are plated and look like silver. A narrow white braid runs round the collar, on each side of which a sprig of laurel is worked. The cap is like that worn by our postmen, only of the same light blue as the coat. It is corded at the seams with white cord. On the front of the cap the number of the Gymnasium is marked, nearly surrounded by two laurel sprigs, the stalks of which are united under the letters and figures indicating the Gymnasium. The trousers are of a grey mixture. This uniform prevails all through Russia, and we meet with it everywhere from Archangel to Odessa.

The usual dress of the professors is a blue tail-coat with hip flaps, like the naval uniform in England, but the collar turns down and is of blue velvet. The buttons bear the eagle of Russia in gold. Ordinary teachers wear no uniform.

The Gymnasium is governed by a director, who usually has the rank of full general. Under him stands the inspector, with the rank of colonel. Professors have the rank of colonel, lieutenant-colonel, and major, according to their standing in the service. All the schools, together with the university, are under the direct control of the Popetchetil, or district curator, and this officer is immediately under the minister, whom, in his own district, he represents. All these gentlemen are in the Imperial service, and look forward to their half-pay, their pensions, their rewards, crosses, orders, honourable mention to the emperor, and so forth, just as much as naval and military officers do. Thus a boy in going to school puts his foot on the first rung of the ladder which may lead him to the position of cabinet minister at last.

The director of the Gymnasium to which we are about to introduce our readers was a "tartar," we mean in the boys' sense of the word.

Anton Gregorievitch Schwann was a very tall ungainly man, with a fiery red face, and an eye that told tales of temper. The flash of that eye was enough to quell the most stubborn disposition, and boys have been known to faint with sheer fright on being threatened with an interview with their director. His terrorism, alike as regards both teachers and pupils, kept the establishment in machine-like order. The boys spoke in whispers except when on the playground. The masters rarely reported boys for ill-conduct, either for fear of inordinate severity towards their pupils or disagreeable consequences to themselves.

To do this tyrant justice, he cared little for what the masters said about the boys, because he would himself constantly visit the classes at the most unexpected times, and the dread lest he should suddenly drop into the class was a sufficient stimulus to keep the boys on their very best behaviour. Therefore when a Government inspection took place, or the

curator paid an official visit, everything in the house was sure to be in apple-pie order. The inspector was a German from the Baltic provinces, whence indeed many of the more important "Russians" have come.

The schools had now begun again to display the alarming forms of the Latin grammar and other deadly foes to school-boy happiness. The monotony of class life droned lazily on, and boys thought listlessly of the "pleasant fields travelled so oft," instead of *amo, amas, amat*.

Mr. Schwann was walking moodily in the grand reception room one morning early in September when a soldier (for the Gymnasium being a Crown establishment, soldiers are used as attendants all over the house) brought up a card and presented it to the director, saying as he did so,

"The police-master himself is below!"

"Show him up. Show him up directly!"

The man was gone like a shot.

He returned as briskly as he went, and standing erect on one side of the doorway, with his hand placed to his forehead, he remained as stiff as a ramrod while he made the announcement.

"His High Excellency General Kakaroff!"

The police-master entered the hall of audience with an engaging bend of the body. He was in full uniform, with all his orders on, and wearing the tremendous silver epaulettes of his rank. Schwann stepped forward with almost cringing politeness, saying,

"To what fortunate circumstance do I owe the honour of a call from so distinguished a visitor?"

"No very fortunate circumstance," was the quiet reply. "But I have come to ask you when you would be at liberty to answer me a few very simple questions about a pupil of yours."

"I hope no pupil of mine has drawn the attention of the police of Moscow upon him!"

"You shall hear. My inquiries have relation to a little fellow of about ten or eleven years old, who has been missing for some time. He was, I hear, a pupil of this Gymnasium. He is known by the name of Ivan Dobroff."

"Ah! I thought that was coming. Little rascal! Always in mischief. Talented boy though. Very clever; very impudent. Absolutely fearless. Why—would you believe it?—he was actually not afraid of me!"

Kakaroff made mental notes of all these particulars, but he wrote nothing down. He asked, after a pause,

"Was this boy on particularly good terms with any of his schoolfellows? Had he any special chum?"

"Certainly. Paul Abrazoff, a boy of the fifth class, or rather the sixth now. He has passed his examination very creditably, and is promoted."

"In what class was Ivan Dobroff?"

"In the second, but he would have gone into the third this term—there is no doubt about it—he was the head of the class in everything; and, although no end of trouble to me and the masters, he was a great favourite with everybody."

"Can I see this friend of his?"

"Not now, unless you particularly wish it. You see the boys are in class, and calling one of them out is always a disturbance, and does more harm than good. But if you would wait a quarter

of an hour all the classes will cease for the pause at noon for play and lunch. If you care to wait, Abrazoff can be sent to you here as to an ordinary visitor."

"Quite wise. I will wait, and you will kindly send the boy to me at the time you mention."

In due course the bell was rung by a corporal, and on the instant the various professors in their uniforms thronged out of their respective class-rooms and poured through the room where the prefect was. The director was about to leave, when the prefect put the card which he had received from Prince Tchernyafiskie into his hand.

"Oh, I see. But it was not necessary. You, of course, are your own introduction anywhere. But you have to excuse me now, I have much to do. You shall have the lad you want sent to you."

The boys flocked out into the large playground, and were soon running about shouting, as is the way with boys all the world over. Here, however, a circumstance was remarkable that put the Russian playground out of all comparison with its English namesake. There was an individual on the watch in the same uniform as the professors, although he was none; he was only an usher, whose duty it was to look after the boys in their play.

Amongst these youths, representing all classes of Moscow society, many stood aloof from play. Some grouped themselves together in little knots of threes and fours. Others walked alone, engaged in committing tasks to memory. Others—and these were certainly half the number of those on the ground—did nothing. They idled so completely as to extract all expression from their countenances. Of these some lay down to idle, but were roused up by the attendant on duty; others leant against walls and stared into space. The most favourite resorts were the garden seats, of which there were many, though not nearly enough to accommodate all who would have liked to use them.

Two boys of about the same age—between fourteen and fifteen—were walking apart from the rest and talking very earnestly.

"I say, Popoff!" exclaimed one of these, "do you remember in the summer, when we were going off together to Faustova, we lost a train through a girl shouting out our names as we were on the platform? Curious thing that was. I cannot to this day call to mind who the girl was. Can you?"

"No. I can't imagine. She seemed to know us both so well. I knew the voice too, and the face seemed familiar to me, but I can no more recall who it was than you. A pretty face it was, too. Wasn't it?"

"Lovely! But that has nothing to do with it. I only wish I could hit upon a clue to the mystery."

"Decidedly. I have asked my sister to tell me the names of all the girls she knows, to see whether she might happen to hit upon the right one; but no, not one was right."

"I mean to ask the boys whether the sister of any one travelled at that time by train."

"Do you recollect the date?"

"Kak-je!" an expression of universal application meaning "How not?" or "Of course."

"Abrazoff wanted!" shouted the play

ground inspector; and the shout was taken up by all the boys who were not too idle to use their voices. "Abrazoff wanted!" resounded on all sides, in all keys, and all possible tones.

"Hullo," cried Popoff. "What have you been going in for? If old Schwann wants you, you are in for a wiggling. I'll clear out."

"If it's too bad I'll send for you," said Abrazoff, jestingly. "But my conscience is clear, any way."

He crossed himself, however, very solemnly, as he hurried through the little army of bluecoats and ran up the school-boys' staircase. At the head of this staircase the inspector met him with a very serious face, and said,

"Make haste, Abrazoff! The police are after you! Nice fellow you are! Now, make haste, will you?"

Greatly alarmed, Abrazoff hurried on. The very name of police is a sound of fear to most people in Russia. It generally means something disagreeable, and always money out of pocket.

But he was not prepared for the politeness of Mr. Schwann, who presented him to the police-master in due form as "Pavel Nicolaevitch Abrazoff." Nor was he prepared for the kind manner of the gorgeous individual who addressed him as his "dear young friend!"

"I am told," said Kakaroff, "that you were very intimate with a little boy of the third class—or, I beg pardon, the second, I think—known as Ivan Dobroff. Now his excellency your director has kindly permitted me to have a private conversation with you on this subject. You would greatly oblige me by telling me something about this little fellow that might guide us in discovering him, or, at least, in obtaining traces of him."

"I wish I could give you any hint, I would do it with all my heart, but I know as little about his present life as you do; perhaps less!"

A smile of not exactly displeasure at this delicate piece of flattery—for to the police mind it certainly was flattery—passed over the countenance of the official. He said nothing, but looked at Schwann, who withdrew.

"Now come to this window—we are away from everybody—and try to recollect something—anything will do—which may connect itself with little Ivan during the summer. I am not going to put you through a regular course of examination. I don't want to trouble or distress you. On the contrary, I want you kindly to bend your mind to the task of assisting me. Try to think of some circumstance in your intercourse with this boy which may lead you to a new train of thought connected with him. But tell me first, Why were you so attracted to him?"

"I fancied he was like my sister in the face."

"You don't mind my taking notes of what you say? It is not for the purpose of testing your truthfulness—which nobody doubts—it is only to act as a guide to my memory in the Dobroff mystery."

Abrazoff started. When had he last heard that expression, and how applied? Was it the Dobroff mystery he had heard about? Mystery, mystery! What other mystery?

Kakaroff saw the puzzled look, and saw also that something was coming that would not come, so he wisely said nothing.

"We are from the same 'government,'

Riazan, and then everything connected with Berozovo has an uncommon interest in my eyes. I love it very much. Ivan does not recollect much about it, but he remembers some things which I liked to hear him talk about."

"For example—?"

"He would talk about his old nurse by the hour."

"What was her name?"

At this question a new sensation seized Abrazoff, for which he could not account. He said, "He called her 'Olga Ivanovna.'"

"Now think well before you answer my next question. Have you, since the disappearance of this poor little fellow, had no clue offered to your mind suggesting what may or might have become of him?"

"Unhesitatingly I can reply, *not the faintest*."

"You have seen nothing recalling him?"

"Nothing."

"Then since that time you have neither seen his form nor heard his voice?"

This form of the question caused a shudder for which Abrazoff could not account. Something, he could not tell what, would not allow him to answer so unhesitatingly as before, but he replied in the negative notwithstanding.

Down went several entries in the book.

At last Abrazoff cried out, "There goes the bell for class! I must leave you."

"Quite right; I will not detain you. But was there any one else who knew him well?"

"Oh, yes; Popoff."

"Well, there is no time for more at present; but think over this matter during class, never mind having bad marks. And if you think of anything—never mind how trifling to your mind—come to me at once at the headquarters in the Tverskaya Boulevard, and give this card to the official in waiting. I will ask your director to let you off from the class at any moment you may feel it right to come to me. Adieu. Many thanks."

Abrazoff left, and Schwann returned.

"I owe your excellency many thanks," said Kakaroff, "for your ready aid in permitting me to talk so freely with that intelligent young fellow. *There is something there!* Now I want you to do this. Let him leave the Gymnasium and come to me the moment he thinks he has found a clue. I have told him I should ask your permission for him to do this; I hope you will not withhold it. And if he wants any other boy with him let him bring him. And pray, if he wants money for the carriage, see that he has it. I must now depend on you for assistance in this important matter. It is of very much more importance than can be measured by the magnificent reward offered. Please to see that he gets off—if he wants to do so—at once. Good morning, and accept my very best thanks."

And Kakaroff was off, leaving Schwann astonished at his politeness. "Ah!" he said, aloud; "the fellow can't mean any good or he would not be so polite;" with which sound reflection he went on his rounds through the school.

Kakaroff was right when he prophesied bad marks for Abrazoff. He was absent in mind, and answered at random all the questions put to him by the professor from the "cathedra," or professorial chair. He was excited and preoccupied,

until at last, as though Kakaroff had been an inspired prophet, and had seen the whole thing coming, he jumped up from his seat and begged permission to leave the class. In some astonishment, this permission was accorded. He was known to be a steady, hard-working boy, one of the best in the school for order and propriety of conduct, so he was permitted to leave. He rushed from the room, and the professor as he left very considerably scratched out the bad marks which he had given him in the official class-book.

Abrazoff ran through the corridor until he came to the soldier at the end, whom he begged to send for the director. The man called a comrade, who found one of the ushers, who immediately went in search of Schwann.

"Hullo, Abrazoff! What's the matter? Taken Kakaroff's hint, eh, to get off from work?"

"Can you let me have Popoff with me, please! The whole thing has flashed across my mind in class. Send an usher with me if you doubt my word. But I never deceived you yet."

"I'm not so sure of that. However, this is serious as far as Kakaroff is concerned; and if you *do* make fools of him and me too, it will be an expensive pleasure in the long run."

But he had sent an usher for Popoff, and a soldier for a prelotkah, and when it arrived he saw the two boys in and said,

"If you can be back for the last lesson, do. If not, never mind. Shall I pay?"

"No, thank you, I have money."

"Be off then—Pasholl!"

No sooner were they seated than Abrazoff seized Popoff by the hand and exclaimed,

"I have it, Costya [Constantine]. I have found it all out. It came like a flash in the class. But what made me put the two parts of the story together was your calling the girl in the train a *mystery*, and Kakaroff calling little Ivan a *mystery*, and the two flashed across me in class, and she's he and he's she!"

"I say! Abrazoff—let's go back—you're not well; come, there's a good fellow."

"Certainly not," said Abrazoff, laughing. "It's all right. Kakaroff is a wizard or a conjuror, or a something of the kind. He has bewitched me. During class I made the most awful blunders. I don't wonder at your thinking me cracked. What do you think first put me on the true scent?"

"I have no idea. I don't know what scent you mean now, and am perfectly at my wits' ends to know what on earth you are driving at."

"Well, I told you that we are trying to find little Ivan."

"My dear Abrazoff, I beg your pardon, but I solemnly assure you that you have said nothing of the kind to me. You mentioned little *Ivan*, it is true, and you said he was a mystery; and the girl in the train being also a mystery, you seemed to draw the conclusion that they must be not two mysteries, but one mystery, therefore Ivan is a girl and the girl is Ivan, Q.E.D."

"Not bad, Popoff; but what set me on the scent was a strange question of Kakaroff's. He asked me whether since the disappearance of Ivan I had 'seen his shape or heard his voice.' I answered frankly *no* to this double question, but I had an undefined feeling that my reply was not truthful, and when in class it

came across me that the voice of that girl in the train was the voice of Ivan, so that though I had not seen his shape I had heard his voice!"

Popoff became as grave as a judge in a moment.

"Why," he cried, "I believe you are right!"

When they presented themselves at the palace of the police-master the official at the entrance observed that the general would see nobody.

"I think he will see me," said Abrazoff, presenting the card.

A military functionary then came down the stairs leading to the first grand hall of the mansion—for there are two, the lower and the upper, in this curious building. The upper one we have passed through already when we introduced Zakoffsky to Kakaroff. The boys were taken to the lower hall by the military gentleman who had descended from the upper hall to meet them. He bade them follow him until they reached a certain door, at which he knocked. It was immediately opened, and the boys were at once admitted. On again producing the card they were immediately confided to an officer, who took them without loss of time to his *chef*.

"Well, Abrazoff," said Kakaroff, "whom have you brought me? I need hardly ask, I see he is a Popoff. Now what is the news?"

"Your excellency asked me whether I had seen Ivan or heard his voice since his disappearance. I fancy that I have heard his voice; so has Popoff here."

"Go on."

"Just before the schools were beginning I came into Moscow, and one day—I think, too, it must have been on the very day that Ivan was really missed, or at all events soon after—Popoff and I were thinking of taking a little trip to Faustova to see the tame wolves, when just as we were going to jump into a carriage we heard a voice which sounded very familiar to both of us, proceeding from the window of a first-class coupée. We ran to the window, and saw two girls in the carriage; they were struggling together. One was much younger than the other, and she was calling our names in a very familiar voice. 'Abrazoff! Popoff! help!' she cried. Now, we both knew the voice, but not to whom it belonged, and we did not know either girl. The face of the younger one seemed most familiar to me. The elder I never saw before, but the other was the very image of my sister, only much younger. I rushed to get into the carriage, but you know you have to get in at one or other end of the carriages in general: I forgot that this was a coupée and ran to the end of the carriage to try to get in, when the horn was blown and off they went. Now, when you asked me this morning whether I had seen Ivan or heard his voice, your question recalled this scene, and I feel sure now that this voice was Ivan's, and in comparing notes with Popoff it seems that we have both noticed the likeness of Ivan to my sister. But what led me to connect the railway story with Ivan in the first instance was a remark of Popoff's coupling the girl mystery with the Dobroff mystery, and I feel certain now that the girl who called us from the carriage window was Ivan Dobroff disguised."

"My dear young friend," said Kakaroff, "you are a model of skill. But

have either of you breathed a word of this to any one else?"

"Not a syllable to any living soul. I was very stupid in class after you left."

"My influence is not good for much," observed the general, laughing.

"I won't say that," replied Abrazoff, seriously, "for you seemed to have filled me with the idea that I was to discover something. We had Roman history this afternoon, and when the professor asked me who defended the bridge against Lars Porsena I replied, 'Ivan the Terrible,' and I must have got some bad marks in consequence. But I kept thinking on what you said about wanting to see you in the middle of the class—about Ivan Dobroff and this girl in the train—when all of a sudden, like a shot, I saw it all, that she was he and he was she! I got leave to quit the class, and Mr. Schwann permitted me to come to you and bring Popoff to prove that we had heard Ivan's voice proceeding from a girl who knew us, and who was in a Gymnasium uniform."

"Of course you did not let the driver hear you talk this over?"

The two boys looked at each other, and then at Kakaroff, without speaking, and they looked as foolish as two boys could look.

"Well, I see how it happened. Never mind."

He touched an electric bell, and instantly a servant out of livery stood in the room.

"Has the izvoshchik who brought these two young gentlemen left or not?"

"I will find out this moment."

The man was gone like a shot. Presently he returned, saying,

"He has just driven off."

"Arrest him at all hazards and bring him back at once. Send Serge Malenko to me."

The servant was gone without a word, and in a very few minutes a tall official in undress uniform was standing in his place.

"Now, Pavel Nicolaevitch, did you pay the izvoshchik?"

"No, I told him to wait!"

"Then you see how guarded one must be in speaking. He knows all about it. Perhaps he is one of the gang. I am nearly certain not to catch him. Of course, you do not know his number?"

"But I do," chimed in Popoff, "it was five ones (11111)—eleven thousand one hundred and eleven."

"First-rate, youngster. You hear, Malenko? Send that number round and let me have the driver in half an hour. He must be stopped before he can reach the Novoye Derayvnie. Send gendarmes, cossacks, and budeschicks so as to cut him off. I *must* have him!"

The official vanished as if by magic, and Kakaroff went on dressing. Then he asked Abrazoff whether he would know the elder girl again.

"Amongst a thousand," was the reply. "She was very pretty and very fair. I should know her directly, and so would Popoff."

"That is something like business. Just touch the top knob in that row of electric bell-knobs. Thanks."

A servant appeared on the instant.

"Have my drosky for two immediately got ready. Let drosky No. 4 be prepared for Colonel Marinikoff and this young gentleman. Cossacks! Telegraph to surround the house of Hermann in the Schou-

valovsky Peryoulok, and to place it under police arrest instantly. No person to leave or enter it till I arrive. Send Schuleikin."

The man was gone and another appeared. This time it was a brilliantly uniformed officer of gendarmes. Kakaroff wrote rapidly on a large sheet of printed and stamped paper, signed the document, sealed it, and said,

"Take men enough to render resistance impossible. This is an order for the arrest of Feodor Karlovitch von Hohenhorst, known as Hermann, and his daughter Annie. Let her have a carriage and bring her here. After I have interviewed her at her father's house, she must be taken great care of and treated with the greatest respect. He is going to Siberia. It does not matter what you do to him, only don't shoot him or cut him down. But this has to be done sharp. March!"

It is quite impossible for us to describe the delight and excitement of our boys at being in such a stirring adventure. They forgot all about home, school, everything. Kakaroff, however, was more prudent; he wrote a note to Director Schwann, asking him to excuse the absence of the two boys to their respective families by writing letters explanatory of their absence on any grounds he liked to assume. He then caused tea and cake to be set before them, while he went to his office to interview many people who were waiting for him, and to give orders in other business as pressing as that of Ivan Dobroff, though not so interesting to us.

While engaged in this manner the bell of his telegraph office rang, and a message was read out by his private telegraph secretary as follows: "Izvoshchik No. 11111 taken driving furiously to the Novoye Derayvnie. Resisted desperately. Papers found connecting him with the stupid Hermann section. On the road to you now."

"That's business," said Kakaroff, rubbing his hands.

He had many papers to sign, and much to do, and many people to see. But at the end of three-quarters of an hour he was ready, and sent an officer to bring the boys to identify the driver. They had greatly enjoyed their refreshments, and came into the official presence with great glee.

"Now," said Kakaroff, pointing to a cleanly-shaved intelligent-looking young man, "do you know that person?"

"No," said Abrazoff, "I never saw him before."

"Nor I," said Popoff.

"Nevertheless," said Kakaroff, "he is No. 11111. Dress him," he added, turning to some officials.

Immediately they arrayed him, much against his will, in the izvoshchik dress, adding a large red beard, a red wig to match, and the hat, when the boys knew him directly.

"Well," said Kakaroff, "this gentleman will keep. So we will make our way to the house in the Novoye Derayvnie. See him secured" (to the police).

The horses were all ready. Abrazoff took his seat next Kakaroff, two Cossacks with their lances rode next, then followed the police colonel, whom we have already seen with Zakoffsky. Beside the colonel sat Popoff, and they all rode off as merrily as if to a wedding.

(To be continued.)

THE STAR OF THE SETTLEMENT:

A TALE OF THE DIAMOND FIELDS.

BY JULES VERNE,

Author of "The Boy Captain," "Godfrey Morgan," "The Cryptogram," etc.

CHAPTER XVII.—AN AFRICAN STEEPLECHASE.

THE aspect of the horsemen—or rather the giraffemen—when they started in the morning was curious in the extreme. It is very doubtful if Cyprien would have cared to have appeared in such guise before Miss Watkins in the chief street of Vandergaart Kopje. But in Rome people must do as do the Romans. Our hero was in the desert, and giraffes were just as good mounts as dromedaries. Their gait was very much the same. Their backs were horribly hard, and they rolled and pitched in a way that nearly made their riders seasick.

In two or three hours Cyprien and the Chinese were sufficiently acclimatised, and after a few attempts at rebellion, which were promptly suppressed, the giraffes became quite docile, and sped along at a rapid pace.

The object now was to hurry on as much as possible, so as to make up for the time lost during the last three or four days. Had Pantalacci caught Matak? Cyprien resolved that nothing should keep him from reaching him.

On the third day the giraffemen entered the plains. They were following the right bank of a much-winding water-course which flowed to the northward, and was probably one of the secondary affluents of the Zambesi. The giraffes, thoroughly subdued and weakened by the long stages and spare diet to which Li subjected them, were driven with the greatest ease. Cyprien could even let go the rope-reins and direct his steed by the mere pressure of his knee. Free from anxiety as to his mount, he took a good deal of pleasure in noticing around him the traces of advancing civilisation. In one unbroken series there stretched away fields of manioc or taro, carefully tended, properly irrigated by means of bamboos placed end to end, and reached by broad and well-made roads. In fact, the district had an air of general prosperity. On the hills which bordered the horizon there appeared the groups of white huts, built of rushes, which served as the homes of its scattered population.

One thing that showed they were nearly out of the desert was the extraordinary number of wild animals peopling the plain. Here and there innumerable swarms of birds, of all sizes and species, darkened the air. Herds of antelopes and gazelles crossed the road before them. Occasionally a monstrous hippopotamus lifted his head in the river, brayed noisily, and plunged again beneath the stream with a sounding splash.

The last thing in Cyprien's thoughts was what greeted his eyes as he turned the flank of one of the small hills. This was no less than Pantalacci at full gallop in pursuit of Matak! About a mile separated the men from each other, and Cyprien and Li were some four miles behind the Italian.

The delight of the latter was unbounded. Cyprien gave a loud "Hurrah!" Li a sounding "Hyugh!" meaning

the same thing, and then they put their giraffes at the trot.

Evidently Matak had seen the Neapolitan, who had begun to gain on him, though he could not see his old master and his companion, who were still too far off over the plain.

The young Kaffir, at sight of Pantalacci—who was not a man to give quarter, and who, without waiting for explanations, might kill him like a dog—hurried along furiously in his ostrich cart. The swift bird almost flew over the ground. It flew at such a rate that it suddenly crashed up against a large stone. The shock was so violent that the axletree broke, one of the wheels slipped off, and Matak and the bits of his chariot were scattered in the road.

The unfortunate Kaffir was dreadfully injured by his fall, but the fright that

himself up, caught the ostrich, jumped astride of its back, and sped off at a run.

And then began an exciting steeplechase such as the world had never seen since the days of the Roman hippodrome, when ostrich and giraffe races formed part of the programme.

While Pantalacci chased Matak, Cyprien and Li chased them both. They wanted the Kaffir for the sake of the stolen diamond, they wanted the Italian to settle accounts with him for his cowardly treachery.

The giraffes were given the reins. They swept along almost as fast as thoroughbred horses, as with their long necks stretched out, their mouths open, their ears flung back, they were spurred and whipped to their topmost speed.

Matak's ostrich proved a prodigy. No

"And then they put their giraffes at the trot."

possessed him was only thereby increased. Convinced that he would be killed if caught by the Italian, he picked

winner of the Derby would have had a chance against him. His short wings, though useless for flying, helped him

greatly. So fast did he speed over the ground that in a very few minutes the young Kaffir had regained all he had lost.

Mataki had chosen his mount well when he took the ostrich. If he could

"Yes; but Pantalacci is ours!" answered Cyprien.

And they pressed on their giraffes still faster.

In half an hour they had nearly crossed the mealy-field, and were only five hun-

dred yards from where the Italian had come to grief. Had he gained the wood, or did he lie on the ground grievously wounded—or perhaps dead?

The unhappy man was where he had fallen. A hundred paces from him Cyprien and Li reined up their giraffes. And this is what they saw.

In the ardour of his pursuit the Neapolitan had not noticed a gigantic net which had been set by the Kaffirs to catch the birds that wage incessant war on their crops. In this net Pantalacci had become entangled.

And it was not a small net. It measured at least fifty yards along the side, and already contained several thousand birds of all sizes and plumage, and among them half a dozen of those enormous vultures, a yard and a half from wing-tip to wing-tip, which abound in South Africa.

When the Neapolitan fell into their midst the birds were naturally alarmed.

Pantalacci was stunned for a moment by his fall. Then he tried to rise. But his feet, legs, and hands were entangled in the meshes of the net, and he could not at first disengage them.

He had not much time to lose. He gave such terrible kicks and wrenches that he tore up the net from the pegs that fixed it to the ground. At the same time the birds, big and little, endeavoured to escape.

But the more the Italian struggled the more he was wrapped in the meshes. And a crowning humiliation was in store for him. One of the giraffes came up—the one that bore the Chinaman. Li jumped to the ground, and thinking that the best way to secure the prisoner was to roll him in the net, kicked it off the pegs in front of him and began to throw it over.

But a most extraordinary thing happened. There came a tremendous gust of wind, bending down the trees as if a water-spout were sweeping over the ground.

Pantalacci in his struggles had torn the net from many of the pegs, and seeing himself on the point of capture, made a desperate effort to get free.

With a violent wrench the last peg was torn up, and the feathered colony that the net held down took flight with noisy tumult.

The small birds escaped, but the large ones were caught in the meshes by their talons at the same time as they spread their wings for flight and together rose.

All these aerial paddles and pectoral muscles working together, helped by the fury of the squall, formed so colossal a power that a hundredweight was but a feather-weight to it.

The net, rolled and heaped and entangled on itself, became the sport of the wind, and, with Pantalacci hanging to it by his wrists and hands, rose thirty yards from the ground.

Cyprien arrived as the net rose, and beheld his enemy flying up to the clouds. The vultures, tiring at their first effort, began to descend, describing a long parabola as they did so. In three seconds they had reached the lentisks and Indian figs to the west of the mealy-field. Then, having shaved the tops of the bushes at about a dozen feet from the ground, they rose again into the air.

Cyprien and Li looked on with horror at the sight of the unfortunate man borne upwards for a hundred and fifty feet by the prodigious efforts of the vultures and the force of the breeze.

Suddenly a few meshes broke, and the Italian clutched wildly at the cords. But his hands missed their hold, and he fell in a heap to the earth.

The net, freed from his weight, shot up in the air, and was soon shaken off by the vultures.

When Cyprien reached him to help, his enemy was dead—killed in this horrible way.

And now there remained but one of the four rivals who had started on the Kaffir chase across the Transvaal.

(To be continued.)

"A most extraordinary thing happened."

only keep up as he was going for another quarter of an hour he would be safe from the Italian's claws.

Pantalacci saw that the slightest halt would lose him all his advantage. Already the distance between him and the fugitive had sensibly increased. Beyond the mealy-field through which they were racing a thick mass of lentisks and Indian figs lay waving in the wind and bounding the view. If Mataki once reached it he would escape, as it would be impossible to keep him in sight.

At full gallop Cyprien and the Chinese followed in chase. They reached the foot of the hill; they were tearing across the field; but three miles still separated them from the Kaffir's pursuer.

They could see that by a great effort the Italian had gained a little on the fugitive. Whether it was that the ostrich was exhausted or had hurt itself against a stone, its speed had greatly slackened. Pantalacci was not more than three hundred feet from the Kaffir.

But Mataki had reached the edge of the wood. Suddenly he disappeared, and at the same moment Pantalacci was violently thrown, and his horse bolted.

"Mataki has escaped!" said Li.

He had not much time to lose. He

gave such terrible kicks and wrenches that he tore up the net from the pegs that fixed it to the ground. At the same time the birds, big and little, endeavoured to escape.

But the more the Italian struggled the more he was wrapped in the meshes. And a crowning humiliation was in store for him. One of the giraffes came up—the one that bore the Chinaman. Li jumped to the ground, and thinking that the best way to secure the prisoner was to roll him in the net, kicked it off the pegs in front of him and began to throw it over.

But a most extraordinary thing happened. There came a tremendous gust of wind, bending down the trees as if a water-spout were sweeping over the ground. Pantalacci in his struggles had torn the net from many of the pegs, and seeing himself on the point of capture, made a desperate effort to get free.

With a violent wrench the last peg was torn up, and the feathered colony that the net held down took flight with noisy tumult. The small birds escaped, but the large ones were caught in the meshes by their talons at the same time as they spread their wings for flight and together rose. All these aerial paddles and pectoral muscles working together, helped by the fury of the squall, formed so colossal a power that a hundredweight was but a feather-weight to it.

The net, rolled and heaped and entangled on itself, became the sport of the wind, and, with Pantalacci hanging to it by his wrists and hands, rose thirty yards from the ground.

RIVALS:

THE STORY OF AN EVENTFUL PAPER-CHASE.

BY HERBERT P. DOLLMAN.

CHAPTER I.

"A DANVERS! A Danvers!"
 "Butler! Butler! Rescue!"
 "Down! You're down! Butler for ever! Hurrah!"

It was "recess time" at Malton House School—that welcome interval of a quarter of an hour devoted to recreation in the middle of the morning studies—and the Fifth Form boys were noisily engaged in what was known at Malton House as "tilting."

As perhaps you may not recognise the sport by that name, it may be as well to explain that tilting is indulged in by those taking part forming two sides, each of which has a "home." From the "home," hopping and with arms folded, the champions charge forth, with the result that one or other of them, unable to stand the shock of the encounter, is, if not completely overthrown, at least compelled to resort to the use of both legs for the preservation of his equilibrium. Vanquished thus from either of these causes, the defeated one must withdraw to the victor's home, there to remain until one of his party approaches sufficiently near thereto to grasp his hand, or until the game is ended by the capture of one entire side.

Now, of course, it is a common and well-known diversion in schools, but at Malton House it was a very favourite pastime, and was played with an elaboration not often bestowed upon it. By the Fifth Form, I mean; of course, you could not expect from the small boys of the lower forms anything but an indiscriminate pellmell struggle. But the Fifth Form fellows went in for tactics. Each side chose a leader, whose orders were to be implicitly obeyed. And, though the battles usually commenced with a haphazard sort of scrimmage, not all the combatants, by any means, took part in it at first.

No. A leader would begin by sending out a few of his men just to skirmish. Then, when he judged that a fit moment had come, a signal recalled his skirmishers, and, swift as lightning, a thick line of fresh men sallied out, and would often capture the whole of the pursuers, spent as they generally were. Not always, for reinforcements from the opposite goal would change the tide of the conflict.

Then what schemes were employed for the rescue of prisoners! While some few scattered men sustained the fight skirmishing, a body of fellows in the shape of a wedge would charge along the space between their own home and that opposite, bearing down all before them, and setting free their comrades in a mass. This phalanx was not to be attacked with much success by solitary champions, but a double line of opponents drawn up in front of their comrades' prison was a formidable obstacle to overcome, leading often to the front angle of the phalanx being broken. When that happened, the strength of their formation was gone, and the best plan to adopt was a swift retreat and a fresh effort.

Sharp-eyed and ready-witted leaders were needed, I can tell you! And such on this particular morning were the two commanders, whose names so often resounded through the playground. "Ivanhoe," sent as a birthday present to one of the boys, had rapidly circulated through the Fifth Form. The description therein of the tournament had fired many a breast, and, imitating the example of the gallant knights, the boys encouraged one another by shouting the names of their leaders as war-cries and rallying-words.

Fiercely the conflict raged that day. The skirmishers had been driven in very quickly, and lines had charged from either side with varying success. Many a champion had dejectedly made his way into his vanquisher's "home," and the ranks had become sadly thinned. But the majority of the prisoners had been taken by Butler's side, and Danvers made desperate efforts to liberate them. Twice had he resorted to the phalanx attack, only to lose more followers; and, after trusting to individual efforts, then to simultaneous onslaughts by two lines of fellows in Indian file, was now about to make a third charge in triangular formation, purposing to join in it himself—a thing which the commanders seldom did, for they had, of course, plenty else to do. But Danvers chose the post of honour at the foremost angle of his phalanx and charged, determined on retrieving his losses.

Drawn up in front of Butler's "home," however, was a triple row of foes, in the centre of the last of which stood Butler. There was a hard tussle as they met. Down went some of the fellows who closed in on the phalanx! Down went some of the fellows in the phalanx itself, but the rest closed up the ranks, and, with Danvers at its front angle, that part was safe enough.

And Danvers had done well. Two men had fallen before him, and he was through the second row. But then he met his match; Butler barred the way. Again and again Danvers bore down upon him. In vain. Butler, though standing on the defensive only, held his own like a rock, while Danvers's exertions began to tell upon him. Then, as he momentarily recoiled after a third attack, his opponent changed his tactics and suddenly charged with all his force. Nothing could well have withstood so quick and vigorous an onslaught. Danvers's arms, from being folded, burst apart. He staggered, and only by placing his raised foot upon the ground did he save himself from falling. And as, bitterly mortified, he entered Butler's "home," his party, dispirited by his conquest, broke and fled for refuge to the other end of the playground, while Butler's fellows raised cheer on cheer.

Vainly his side tried to rescue him. Small in numbers, and ever getting smaller, their efforts were unavailing. But the worst of all was to come, for, to his joy, Danvers had perceived that little Horner, unnoticed, had made a circuit and come quite close to his prison. The

plucky little chap overthrew one of Butler's men, who at the last moment intercepted him, and in another minute would have touched his leader's hand, and so released him, when old Davies, the school porter, made his appearance with the bell, whose unwelcome jangling put a stop to the combat altogether, for recess-time had expired, and the ringing of the bell was the signal for the Fifth Form to reassemble in their class-room.

It was with feelings of the deepest mortification that Danvers obeyed the summons, following slowly the crowd of boys who went chattering up the staircase. If he had only been set upon by a number of fellows just now and had succumbed to their united efforts, he would not have minded his defeat. There would have been no disgrace in it. But to have been worsted by a single opponent, above all by Butler, was very galling, for he knew it entailed on him a loss and on Butler a corresponding gain in prestige. And that was a thing not to be borne. For between Butler and himself there was, and had been for some time, a great rivalry. Not in tilting only, but in class, in all sorts of sports, in everything.

There is in most schools a head boy. Sometimes you may find his position has been gained in the class-room, sometimes in the cricket field; but very often he obtains his place as captain of the school by a combination of intellectual and physical superiority. Now Danvers had been until a year ago in this enviable state. But then he found his supremacy becoming endangered by the rising into general estimation of Butler, and at last, try as he would to retain his dominion, from being the first in the school he had become only one of the two foremost.

If he could get the better of Butler in mathematics, Butler was ahead of him in French and German, Latin and Greek. If he could "slog" at cricket in a way that was quite unapproachable, Butler was more than his match at bowling, and was the best catch in the whole school. He could, as young Horner said, "lick Butler into fits" on the parallel bars, at the high jump, and the long jump. But then of a winter afternoon, on a half-holiday when the weather was bad and they could not go for a walk or go out of doors at all, Butler would get every fellow in the "Fifth" round him by the fireside, listening eagerly as he told those wonderful stories Danvers could not for the life of him invent.

When the first eleven—there were fourteen fellows in it really, but of course they called it an eleven—when the first eleven had, at the beginning of the cricket season, voted for the election of a captain, the result was a tie between Butler and himself. So he and Butler had to toss up. When he won the toss, what cheering there was from his partisans, and what counter-cheering from those who had voted for Butler! As a set-off to this, when football came in

The Story of an eventful Paper-chase.—See p. 295.

Butler was chosen captain of the first team, a post which he himself had held last year, in addition to the captaincy of the first cricket eleven!

Now it is not pleasant to find oneself being overtaken in this way when one has been "king of the castle" all round. If the two lads had been left to themselves, though, there would have been no harm done, and a generous rivalry between them might have been the only result; as Danvers, though hot and quick-tempered, was a good fellow at heart, while Butler, stubborn and unyielding as he often could be, was frank and honourable, and would have scorned to have been guilty of any malicious or underhand conduct.

But, as with the wider outside world, Malton House had, unfortunately, its share of mischief-makers, both of the malicious and the thoughtless order, so that where there might have been a friendly competition, there sprang up a feeling of bitter hostility which impelled them to outvie one another in everything, little or great, and entirely stopped all healthy intercourse between them.

On one thing both had set their hearts, and that was the possession of the school medal. Though there were plenty of prizes in the shape of books given at the conclusion of each term, there was only one medal for the whole year, and that was awarded at the Christmas breaking-up to the boy who had gained the greatest

number of marks during the period from January to December. The last week but one in the Christmas term was devoted to an examination, and the marks then obtained were reckoned in the aggregate of the year.

Danvers and Butler had a pretty equally balanced score up to the present, so that it was in the examination that the advantage would have to be won. This was not to come off for five weeks yet, but already speculation was rife as to the result. Praiseworthy as their desire to excel in it might have been, the bitter feelings which now incited them to the contest quite outweighed any of the advantages of the competition.

(To be continued.)

SCHOOL AND THE WORLD:

A STORY OF SCHOOL AND CITY LIFE.

BY PAUL BLAKE,

Author of "The Two Chums," "The New Boy," etc.

CHAPTER XXVII.

"COME, Soady," said Garland, next afternoon, "you've had enough of that excellent grammar for an hour; come and make a call with me on your way home."

"He will be all right in a few weeks," said the doctor.

Soady closed the book, murmuring some mystic facts about increasing short in the genitive, and announced he could give him half an hour.

"Plenty of time; it's only up by Endsleigh Gardens."

He named the address.

"Why, he won't be home," said Soady.

"He? I'm going to see a lady."

"Don't you know that's the house where Lang is living?"

"No," replied Garland; "you don't say so? I'm going there to see an old friend of my father's, Mrs. Hawtrey, a charming lady."

"Any daughters?" asked Soady.

"One—Maggie. She's very pretty and sings like a nightingale."

"I'll come," said Soady; "perhaps she'll let me play her accompaniments some day."

They arrived at the house about half-past four. Mrs. Hawtrey welcomed Garland warmly, and Soady was introduced to her and her daughter.

"We were old schoolfellows," said Garland, "and we are at the same tutor's now. Oddly enough I only knew just now that you know another schoolfellow, Lang."

"Is Mr. Lang a friend of yours?" asked Mrs. Hawtrey.

"Yes; do you see much of him?"

"Quite enough," put in Maggie. "He scarcely has a word to say, and always seems in wretched spirits."

"It's the exam.," explained Soady; "you've no idea of the depressing effect of keeping company with grammars and so on for months together. I'm in the middle of it now."

"It doesn't seem to have the same effect on you," said Mrs. Hawtrey, with a smile.

"I don't stick to it so hard as Lang," exclaimed Soady; "I take an hour and a half or so off every day. Then I've my music to practise and Caractacus to circumvent."

"Who's Caractacus?" asked Maggie.

That necessitated an explanation from Soady, which he gave with considerable humour. He was in the middle of it when Lang entered.

He stood the picture of surprise when he saw his two friends sitting there, as much at home as if they lived there. Garland, however, explained the situation, and Lang looked unaccountably relieved.

"How have you got on to-day?" asked Mrs. Hawtrey.

"It's all over," said Lang, with a sigh of relief.

"You must be glad of it."

"I am, very."

"Now," said Mrs. Hawtrey, kindly, "you must take a holiday and do nothing for a month. You look tired and worn out."

"You don't look well," said Soady; "try a wet towel round your head."

"I don't think I am very well," acknowledged Lang; "I shall go home to-morrow, I think."

"I think it would be wise," said Mrs. Hawtrey. "By-the-by, whilst I remember it, I want all of you to be at your best in the course of three or four months, for I am going to enroll you all in my company for helping at a bazaar they are having near here. Can I count on your aid?"

All promised to do what they could to assist.

"What is the bazaar for?" asked Garland.

"It's for the Home connected with St. Peter's."

"Mr. King was talking about it," said Garland; "some relation of his is the secretary."

"I shall make you work pretty hard," said Mrs. Hawtrey, warningly, "so don't promise too rashly."

"We're all accustomed to hard work," said Soady, "so you need not fear our breaking down."

The two visitors left soon after, and Lang took the opportunity of retiring to his room.

"Charming woman," said Soady, warmly. "What does she live at a boarding-house for, though?"

"Her own house in Tavistock Square is being done up, so she's staying there for a couple of months," explained Garland.

"I say, doesn't Lang look awfully seedy? This business has quite knocked him up."

"I don't at all like the look of him," remarked Garland.

He had been wondering a good deal lately what was the matter with Lang. He had not formulated his suspicions yet, but he fancied something was up which would not bear inspection. Not a word of this, however, did he breathe to any one, not even Soady.

CHAPTER XXVIII.

LANG was more than thankful the exam. was over. The relief was tremendous. More than that, he felt really ill.

The events of the past week, the constant strain on him, the anxieties he had passed through, had proved too much for him. He was not aware how ill he was. He thought a few days' rest would set him all right.

He wrote home to say he was coming next day. He resolved to start in the morning. That plan would have its advantages.

In the first place he would escape seeing Fanshawe. As he had no money to pay him it would be worse than useless to see him.

He wrote him a short letter telling him he had been robbed of all his money, that he could not ask his people for more, and that he must ask him to wait for some time, when he would pay £12 instead of the original £10. He did not say he was going away, as he did not want Fanshawe to know where he was.

He also wrote short notes to Garland and Soady, asking them not to let Fanshawe know his address if he should inquire it of them. He hesitated some time before sending these, but did so at last.

"What's it matter if they do know that I want to keep clear of him?" he asked himself. "They will think it a very good job."

The night before he left he went to bed early. He was in the middle of packing when there was a knock at the door.

"A letter for you, sir."

He took it in. A strange hand. He felt unmanned for a moment. What a condition to be in, when the sight of a stranger's handwriting can throw you into a cold perspiration.

He opened it and glanced at the signature—C. Melhuish.

"Melhuish!" he exclaimed. "How does he know where I am?"

A moment's reading, however, showed him that it was not from his old school-fellow, but the latter's father.

It ran thus:

"My dear Sir,—I heard by accident the other day that you were in London, so I obtained your address from your father, and write to you on a subject which will excuse a letter to a stranger. As you know, my son ran away from St. Mary's last half; since then we have heard nothing of him except one letter to his mother, in which he said he was well but would never return home. The postmark was London, and we conclude he is hidden somewhere in that city. We fear he must be in distress, but are powerless to aid him. It has struck me that possibly he might be more ready to communicate with an old schoolfellow than with any one else. May I place an advertisement in the papers, saying that you would be glad to hear from him, and giving your address? I would even promise that no effort would be made to trace him if only I could be assured of his safety, and of his not being in want. Should you see him you might be able to work on his feelings and induce him to return home. Do not mention my request to any one."

There were a couple of pages more, partly devoted to a touching picture of the misery caused by the wrong-doing of a son. Lang felt that his parents might have the same sad tale to tell one day.

He determined, however, to write to Mr. Melhuish in the morning, and tell him that it was impossible he could grant his request. How could he have his address advertised when he was trying to keep it unknown to Fanshawe?

A cruel fate his! to be shut out from the possibility of doing a kind action.

He would try and do Melhuish a good turn. He sat up and wrote to Mr. Melhuish, saying that he was quite at liberty to make any use of him he wished; the only stipulation he would make was that the address given should be "A. B. C., care of R. Soady, 15, King Street, W.C."

Then he wrote a line to Soady, asking him to forward to him any letters that came to him for "A. B. C."

He reached home next day. Before night was over he was in a fever, and the doctor's face was a great deal more grave than his parents could see without anxiety.

"He will be all right in a few weeks," said the doctor, "but he will not be able to work for two or three months."

CHAPTER XXIX.

ABOUT a fortnight later Soady thought he would stroll down to the university and see if Lang had passed or not. The lists were due at nine in the morning, but he could not manage to run down till the afternoon.

He had heard nothing of Lang's illness. He had been too busy to write to him; however, he now hoped he could send him a letter of congratulation.

He was as much surprised as pleased to find Lang's name in the first division. He looked again, but there was no mistake.

"Well," he thought, "if I want to pass my exam. the best way evidently is to shy away all my books and go in for football like Lang. Why, he hasn't worked a bit till the last fortnight, and here he comes out high up, just as if he'd been burning gallons of midnight oil."

He could not make it out. He knew that exams. were often very uncertain in their results, but this beat everything.

He turned down the broad steps to return home when he found himself face to face with Fanshawe.

"Hallo, Soady, you here?" exclaimed the latter, holding out his hand.

"Yes, I came to see if Lang has passed."

"How odd; so did I. Has he?"

"Yes, first division."

"That's lucky; he'll save a year's articles," said Fanshawe. "We must have something together over this. Come to the Café Royal with me and I'll stand you treat."

Soady would have declined if he could, but Fanshawe gave him no time.

"I've been in luck lately," he said confidentially to Soady. "An old aunt of mine died the other day, and I've come in for a hundred pounds of the pickings, so I'm having a high time just now."

"I'm very sorry," said Soady, referring to the death of his aunt, to which he thought he ought to make some allusion.

Fanshawe laughed. "That's more than I am; she was no good to me whilst she was alive, she is some good now. I expect I shall make the coin circulate faster than she did, and that's good for trade; so I'm a benefactor of society."

He proved his word by spending half-a-crown in needless refreshments. Soady had had enough of him by now, and wished he had not yielded so far as he had. But Fanshawe's talk always amused him, and perhaps one of Soady's weak points was want of decision in avoiding those whose companionship might lead to evil.

"Where are you off now?" asked Fanshawe.

"I'm going straight home," he replied.

"Are you? I'll walk up with you. I haven't seen your rooms yet."

But this was a touch too much; Soady meant to do piles of work that evening. He compromised the matter by promising to go to Fanshawe's lodging for an hour the next evening.

He regretted afterwards he had done so. He did not like Fanshawe at school, and from what he had seen of him since he left he disliked him still more. He resolved this visit should be his first and last.

He wrote to Lang to congratulate him, and asked him when he should see him back in town. His own examination came on in a fortnight; after that he too was going to leave London for a season.

He turned up at Fanshawe's at nine o'clock. The rooms did not look so bad this time, for the occupier had spent a pound or two in a new table-cover, a bookshelf, and so on. Still Soady thought they appeared dirty.

To his annoyance he found there were two other men there, and it was evident that cards were to be the amusement of the evening.

"Here you are at last, old man," cried Fanshawe; "let me introduce you."

This was a pleasure which Soady could

well have dispensed with. He did not like the looks of either of the visitors; they were unintellectual, and rather coarse-looking.

He must stop, however, he thought, now he had come, and so he tried to make himself pleasant. But by-and-by money began to change hands, and the stakes to be increased. He could stand it no longer.

"I think I'll get you to excuse me," he said, rising. "I've got some work to do to-night."

"Oh, bosh! you can't go yet," said Fanshawe. "Have some whisky?"

"No, thanks; I want to keep my head clear for mathematics."

"Are you going to break up the game?" asked Mitchell.

"I'm sorry to do that," said Soady, "but I had no idea there was going to be one, or I'd have asked Fanshawe to excuse my coming."

"Perhaps it's the fear of losing half a quid that frightens him," said the other visitor.

Soady looked at Fanshawe to see if he would say anything to the speaker; but as he did not Soady reached his hand for his hat.

"Oh, confound it all, Soady; what on

earth do you want to trot away at ten o'clock like a baby for?"

"To work," was his reply. "Good-bye."

"What do you mean?" asked Fanshawe, angrily. "Do you want to insult us?"

"I've no wish to insult you as I'm in your house. As to your pair of friends, after what they said to me without your interference, I don't care two straws whether they think themselves insulted or not."

Mitchell sprang to his feet, but Fanshawe pushed him back.

"Sit down," he cried; "this is my business."

Soady made a step towards the door. Fanshawe caught his arm; he wrenched himself free. Mitchell made for him, but Soady's blood was up, and he gave him a blow which knocked him over a chair. Then he slipped out of the room and out of the house.

"I'm well out of that," he said to himself as he crossed the street. "I've broken with that Fanshawe for good and all; I was afraid every moment he was going to ask Lang's address. I wonder what Lang wants to conceal it for?"

(To be continued.)

REX.

BY ROBERT RICHARDSON, B.A.

REX—Rex Lorrain—and we owned him
king,

Both in and out of school;

Who so safe for a neat drop-kick?

Who so steady and cool

When the game was going against us? Then

He played with heart and soul,

Played as Hector fought for Troy,

And won us many a goal.

'Twas good to see our captain row

With thews like heart of oak;

We feared no foe on the river I know

When Rex Lorrain pulled stroke.

And what a skilful general he

When we took the field for cricket—

We were safe to win two games in three

When Rex Lorrain kept wicket.

And the other day, after long long years,

I met him in London city,

And the change in our dear old football king

I could not choose but pity.

Seventeen stone! And the envious years

Had thinned his bonny brown hair;

Rich he was, but his wealth had brought

Its tally of thought and care.

We dined together, Rex and I,

And after a little while

Our talk brought back to his handsome face

The ghost of his old fine smile.

And we told again how 'gainst St. Bede's

We played that uphill match,

When he turned the tide of a losing game

By his famous running catch.

"Well, well, they call me lucky," said he,

"And I suppose it's true;

My freighted ships are on the sea

From Ind to far Peru.

But never a stroke of luck I've had

Can for one moment match

The thrill of pride that day, old lad,

When I made that famous catch."

CANOES, AND HOW TO BUILD THEM.

BY C. STANSFELD-HICKS,

Author of "Yacht and Canoe Building," etc.

CHAPTER X.—ON THE CONSTRUCTION OF A SAILING CANOE.

SHEER PLAN of SEA CANOE

HALF BREADTH PLAN

A Place for Mainmast.

B Place for Mizenmast.

C C Well.

D D Coaming of Well.

As we have seen, a canoe built for the purpose of sailing must have sufficient lateral resistance given in one form or another to enable her to hold to windward, as nothing is more annoying than to have a boat which after a dozen tacks closehauled is no more to windward than when she first started, or in an extreme case is actually to leeward of her starting-point. Now this can be obviated by proper attention being given to constructing the immersed portion of the canoe with sufficient depth to have a good hold of the water; this can either be given by a deep form of body and a fixed keel, or by means of a centreboard.

The first plan is that generally adopted in yachts, however small, but is not suitable to any but large canoes and those which are kept almost always afloat; for such, however, it answers well, and saves the troublesome centreboard. But in most instances it will be found that the centreboard, with all its disadvantages, is the best system of obtaining sufficient hold of the water.

The different forms of centreboards have already been commented upon, and the directions given for building the sharpie afford sufficient information as to the method of fitting centreboards, while the details of the Rob Roy's construction, combined with previous articles on boatbuilding, will give you sufficient information as to the best way to construct such a canoe, full details being there given ("Boat Building" in Vol. iv., page 676) as to the construction of clinker, carvel, and diagonally-built boats, together with a description of the riband carvel, which is perhaps the most suitable method of building a canoe. However, I should advise you, if you have not had previous experience in boatbuilding, to turn your attention to the flat-bottomed form of canoe as a first essay; it will cost little, and you are far more likely to make a good job of it than of a canoe built in the usual way with keel, ribs, etc.

The last form of canoe we shall now consider is the sea canoe, this canoe being larger and stronger in build than a river boat; and being generally used in deep water may be

constructed without centreboard and with sufficient draught and false keel to give the requisite hold of the water. Such a form of canoe is shown in the plan. As you see, she has considerable beam in proportion to her length, the plan being a little more than three beams to the length; the depth is rather less than was intended, half the beam being the proper proportion for depth, the measurement being from the under side of the deck to the top of the keel. A little more draught of water would do no harm, as shown in the body plan, Fig. 2. E E E in the half-breadth plan shows the shape of the canoe at the water-line, and D D shows the coaming of the well. The rudder-head is fitted with a brass yoke; a similar yoke, to which a tiller is attached, is pivoted to the deck just forward of the mizenmast, the yoke being in a line with the one on the rudder, and at the same height. These yokes are connected by

SEA CANOE

light chains or lines so that the tiller forward of the mizen on being moved immediately acts on the rudder as required. By this plan the boat can be steered as easily as if the position of the mizen allowed an ordinary tiller to be used. For particulars as to building I must refer you to the Boat-building articles already referred to, and shall merely give a few details not touched on in them. The timber required in the construction of the Rob Roy will be as follows, in the rough:—

The keel, oak, thirteen feet long, one inch and a quarter by one inch.

The hogpiece or kelson, thirteen feet long, three-quarters of an inch by three inches.

The ribs, quarter inch by half inch, bent to shape.

The deck may be in four pieces, one for each end, one for each side of the well, and should be about five-eighths of an inch thick; the coaming of oak one inch and a quarter by one inch and a quarter, standing about three-quarters of an inch to an inch above the deck. The planking of the Rob Roy should be a quarter to five-eighths of an inch. I have seen such a canoe planked with Willesden paper, and it appeared to make a very good job.

The corners of the hatchway or well, and other such places, should be strengthened by means of copper brackets, and the stem and stern parts may be made of about the same dimensions as the keel, but rather deeper. Two ways of constructing them are shown in a former article. Strong knees should be introduced, and the posts strengthened in every way, as such a canoe has a great deal of knocking about to undergo. The hatchway may be three feet long by half that width. The other dimensions are given in the chapter on the Rob Roy.

The sea canoe may be built rather heavier than the Rob Roy, as she is not intended for so much land transport. The planking may be three-eighths of an inch or even half an inch, as such a canoe is to all intents and purposes a small decked boat, and will carry two or even three people. Her length is about eighteen feet, beam five feet, and depth two and a half feet. But such a beam is extreme, and three feet six inches or four feet would be ample for most purposes. It is, of course, impossible to paddle such a craft, which is only a canoe in name. Short light sculls are used with brass crutches to fit in holes in the gunwale. The size of the hatchway is seven and a half feet by three and a half feet. The ballast is best carried in the form of an iron keel, which will give an enormous amount of stability to the boat at a small expense, and leave the interior unencumbered by ballast, save a small amount in

Poor, but Happy!

shot bags for the purpose of trimming the boat. The balance lug is perhaps the best form of sail, though a couple of sprits and a staysail set on a short iron bumpkin forward will answer extremely well, and under them the boat can be kept very close to the wind. However, before you attempt such a craft you will do well to try your prentice hand on some easier form, and it would not be a bad plan to build a model about two or three feet long as an experiment, which would hardly cost you anything, and would teach you more than all the books you could read. The tools, etc., required and the mode of steaming the planks have been treated exhaustively in Vol. iv., pages 742-3.

The woods most suited for your purpose are English and American elm, spruce, larch, cedar, teak, and mahogany; oak, English and foreign; pine, red, white, yellow, and pitch. Of these, pine, oak, mahogany, and cedar are more used for small work, and the other woods for large boats, steam launches, and yachts. Elm is excellent to use if it is to be kept under water, but if between wind and water it soon rots. Pitch pine is a very good and cheap wood for large work, but it is heavy, and not at all suitable for small craft. Spruce, larch, or red pine is the cheapest and easiest wood to work for small boats and canoes, while cedar and mahogany are useful for deck fitting, but are too expen-

sive for amateur boatbuilding, at all events to commence with, though no doubt very handsome craft can be built of these woods.

Oak is best for travelling canoes, but is difficult to use; and except for the keel, which might be of oak or elm, and the timbers, which must be of the oak, American elm, or ash, soft wood can be used for planking, except where great strength is required. As a general rule it may be laid down that soft woods are not so strong, and decay sooner than hard woods; but still, for some purposes and in some places, soft wood answers as well as hard, and costs much less.

The nails used were fully described, except French wire-nails, which were not alluded to. These answer very well for cheap boats, being inexpensive, strong, and pliable. Ordinary clout-nails, too, are very useful if good, which can be tested by bending them; they ought to bend easily without breaking. They must be just long enough to go through the wood and leave about a quarter of an inch to turn over with the hammer until buried in the wood, which must be done in the direction of the grain of the wood. If the nails project too much they should be cut with a pair of cutting nippers until only sufficient is left for a turnover. A hole should be first bored with a small bradawl before the clout-nail is driven in the wood; but the copper nail and roove, as described, is by far

the best, though most expensive, fastening. Clout-nails, if used, should be galvanised.

Copal varnish is best for canoes, but it is expensive, the best being about eighteen shillings per gallon. There is a cheaper kind, not nearly so good, called boat varnish, at about ten or eleven shillings a gallon. Two coats of varnish will do, but the first must be given time to thoroughly dry before the second is put on. For a cheaply-built boat paint will do as well as varnish, and is far cheaper; but a well-built and handsome boat is worth varnishing, and it would be a pity to "spoil the ship for a ha'p'orth of tar."

And now, in conclusion, I would advise those of you who intend establishing private boatbuilding yards to write up to the publisher for all the numbers which treat of boatbuilding, for you will save the few pence they cost over and over again in the construction of your boat, and you will find it far more handy to have them by you, stitched in a neat little cover, than to be always wondering what number it is that has some especial bit of information that you are just most anxious to obtain to go on with your work. If you succeed in building the canoes you have had described to you, the next step you will take will be the construction of a sailing boat or small yacht, and the BOY'S OWN PAPER will be of help there.

(THE END.)

FISHING FOR THE MONTH.

FEBRUARY.

HE angler will probably have but little sport during this month except on very fine days, and then he can try the roach or dace with every prospect of success, if a well-scoured worm, either lob or giltspur, be the lure. The last eight monthly references to fishing have probably put him *au fait* with most of the methods pursued in the capture of our coarse fish, and I need not therefore further detail them when recommending him to try any fish which seems to be handiest. As this is a time for indoors rather than outdoors, I shall now touch on a subject about which little is known, though it is a very interesting one for those fishermen who like to see that their piscatory success ministers to the comfort

and pleasure of others as well as themselves.

During five-and-twenty years of extensive experience by lake and river, the writer has noticed how little people know how to make their fish palatable for the table. Of course I do not expect boys to cook their own victuals—though it may be handy to some of them to know how to do that some day or other—but after they have caught, say a nice dish of perch or roach, it is a pity that they should be thrown or given away when, if they are in really good condition, they make remarkably good fare. Neither do I want to insult mamma or cook by insinuating that they do not cook freshwater fish aright, or that I can teach them. My object is simply to point out to boys the simplest means by which their captures may be made eatable, and in some cases delicious, let the epicure say what he will. Let us begin with the smallest fish that boys catch—namely, the minnow.

It is quite possible during winter to gather large quantities of these lively little fellows, as, like other fish, they have a tendency to herd at this period, and are easily taken by means of the casting-net. As they do not now feed much, there is no necessity to attempt to clean them beyond throwing them into strong salt-and-water for a few minutes. They are then to be taken out and treated in precisely the same way as whitebait, and excellent they are. Isaac Walton gives an elaborate recipe for what he calls a "minnow tansy," but it is too out of date to reproduce here.

Gudgeon.—These fish are if anything more toothsome than smelts, to which fish they have, however, a slight resemblance in flavour. The wives of the Thames fishermen cook them to perfection, and their secret is the extreme freshness of the fish. The fishermen in cleaning them scrape off the scales, and make

a cross-cut through the belly. The viscera are then squeezed out, and the fish simply wiped with a cloth and pitched into the pan over a clear fire. Of course egg and bread-crumbs can be used, but the secret is to cook them immediately they are dead.

Roach and Dace are cooked in a similar way, but previous to putting them in the pan of boiling fat they should have been salted slightly and allowed to remain for some little time. This treatment extracts the superfluous moisture, and renders them firm and sweet. After they are opened no water should be allowed to touch them, simply a damp cloth.

Barbel I never could manage to make eatable, do what I would. *Bream* are by no means despicable if cleaned, filleted, and then slightly salted. Lay each fillet on a layer of clean pebbles to drain, and fry in boiling olive-oil. The way to tell if the oil is hot enough is to dip in a sippet of bread; if the bread turns a light brown the oil is ready. The fish is dipped in egg and bread-crumbs, of course. *Chub* are very coarse fish indeed. I know of no method by which it can be said to be anything but very poor eating. Walton gives a recipe, however, which I quote as a curiosity, as well as, perhaps, the best method even in these days of dressing the fish. He says, "When you have scaled him and cut off his tail and fins and washed him very clean, then chine or slit him through the middle as a salt fish is usually cut, then give him three or four cuts or scotches on the back with your knife, and broil him on charcoal or wood—coal that is free from smoke, and all the time he is broiling baste him with the best sweet butter, and a good store of salt with it; add to this a little thyme cut exceedingly small or bruised into the butter." These directions are best followed out by means of a toasting gridiron, which can be arranged in front of the fire.

While I am about it, the other more elaborate recipe of Walton's might as well be given; and if the cook can make chub palatable by its means the space will not be wasted: "First scale him"—I suppose by this time you have learned how to catch him!—"and then wash him clean. Then take out his guts, and to that end make the hole as little and near to the gills as you may conveniently, and especially make clean his throat from the grass and weeds that are usually in it; for if that be not very clean it will make him taste very sour. Having done so, put some sweet herbs into his belly, and then tie him with two or three splinters to a spit and roast him, basted often with vinegar and butter, with a good store of salt mixed with it. Being then dressed, you will find him a much better dish than you or most folk, or even anglers themselves, do imagine."

I have in the foregoing articles termed the *Perch* the freshwater sole, and to my taste so it is. The scaling of the fish is very hard work, but if the fish be dipped in scalding water there will be no difficulty in getting them off. My plan of preparing them does not include scaling at all. I simply take the fish as it comes from the water, and remove the gills, attached to which the viscera comes away also. After wiping the perch with a damp towel, it is placed on the gridiron over a clear fire. When done it is split with a knife

along the back, and the armour scales come away in a piece; the flakes of flesh come away entirely from the bones, and are placed on a very hot dish to be served with fresh butter and whatever condiments are preferred. Some persons prefer lemon, as with soles, myself amongst the number. Dressed this way, in its own juices, it is a most delicious fish—the roe is especially a delicacy, being of a rich creamy flavour.

Pike from clear waters are far from being worthless, notwithstanding that the Rev. J. J. Manley, in "Fish and Fishing," describes its flavour as being like blotting-paper. If a nice fish of three pounds be boned and filleted, and broiled or fried in oil, there is much worse fare to be found. Especially is this the case in reference to the pike taken from a trout river. The boning process is not very difficult, and is best puzzled out by yourself, as I am afraid no one could learn from a written explanation. Of course you commence with the backbone, and there is not much to do if you are careful.

Eels are dressed in a multitude of ways, and are always palatable. The silver or sharp-nosed eel is the best species, the others requiring to be kept some days in clear water before cooking. Fried eels, unless they have been previously parboiled, are very rich, and quite unfit for consumption by delicate people. What says Ingoldsby?—

"*Credo experto*, trust one who has tried,

Have them spitchocked or stewed, they're oily when fried."

Here is a famous way of stewing them, which is the recipe of an hotel on the Thames whose proprietor was famous for its production.

Ingredients.—Two pounds middling-sized eels, one pint of medium stock or liquor in which the eels are boiled, quarter of a pint of port wine, salt, cayenne, one teaspoonful essence of anchovy, one teaspoonful Indian soy, and a thickening of cornflour.

First, skin and carefully cleanse your eels, cut them up into pieces three inches long, and put them in your saucepan and cover with water, adding a good-sized piece of salt; after they have simmered, say twenty minutes, take them up and pour off all the liquor; have ready some boiling water, with the usual addition of salt, and cover the eels with it as before. This takes away the extra richness which disagrees with so many. Now allow them to stew for fifteen to twenty minutes longer.

That done, take them up and keep warm while your gravy is being made. Save the last water, as it will answer for stock. Put your salt, cayenne, anchovy, Indian soy, and cornflour into a basin and carefully blend to a smooth paste with your port wine; have your last water from the eels boiling, and gently pour it into the basin, constantly stirring, or it will be lumpy, instead of a smooth, rich-looking gravy. Put the whole back into your saucepan with the eels, bring to a boiling point, and serve.

Carp to cook.—The editor of "Food and Health" gives the following ways:—

Plain boiled.—Scale and clean the carp well, dry it,

wrap it round with a piece of larded paper, and put it on the pan that has been slightly greased. When done, sprinkle a few drops of lemon-juice over it if you prefer it.

To stew in gravy.—Make a gravy with a small piece of melted butter, some flour stirred into it, add a couple of shallots chopped very fine, some peppercorns, mace, two cloves, salt, and now amalgamate with a little warm water. Put in additionally some claret or port, or if you do not wish to use these, some malt vinegar, and a spoonful of sauce or mushroom catsup, also a couple of lemon slices. Place your carp into the sauce, either whole, cut in half, or in slices, according to its size, cover up tight, and let it gently simmer for half an hour or so. Some put a few slices of ham under the carp. The carp and gravy, eaten

with potatoes, salad, parsnips, and cabbage stewed, or mushrooms, make a good dish.

Carp, to bake, when stuffed.—Clean your carp and prepare your stuffing, some bread, finely-chopped suet, a little parsley and thyme, a small chopped onion, pepper, salt, and nutmeg, chopped lemon-peel, moistened with the yolks of eggs; stuff the fish up with it, and tie up. Wrap the fish in greased paper, and either place butter in the tin, or some lard, or a few slices of bacon. Place this in an oven, or cover over on top. When done, make a brown gravy with fat in the pan, and pour over the fish, or eat dry if you prefer. Beetroot salad or potato can well be eaten with it. Also fried or mashed potatoes, and various vegetables, green peas or beans.

J. H. K.

THE POULTRY RUN.—In our last month's DOINGS we gave some hints about the management of fowls in general, and on their food and feeding, and also said a word or two about the meaning of the word "poison." Boys who have not read these should read them, and boys who have, ought to be *au fait* in the principles they teach.

We should like here to say a word or two about books on poultry-keeping. A boy should have a book of some kind about the particular fancy he takes up, whatever that may be. A penny or sixpence put aside now and then in a money-box or drawer soon accumulates to a very handy sum; and how much better is it to expend money thus saved on books than upon toys! Our advice always is, buy your books, and make your toys, whether they be scientific or otherwise. Well, then, the first book deserving of notice is Lewis Wright's "Illustrated Book of Poultry" (Messrs. Cassell and Co.). We believe it can be bought secondhand through the "Exchange and Mart" for about 27s., though it is published at 45s. It is a most excellent work. Then Tegetmeier writes a large work; we do not know the price, but it is published by Routledge and Sons. Messrs. Orr and Co., of Amen Corner, Paternoster Row, also publish a good poultry book. These may be called the advanced text-books of the poultry world. There are others, however, good enough for beginners. Two of these deserve special mention. Mrs. M. A. Wilson's "A B C Poultry Book," price one shilling; and L. Wright's "Practical Poultry Keeper," three-and-sixpence, both published by Messrs. Cassell and Co.

Lastly, there are the thoroughly practical and comprehensive illustrated articles, by Rev. J. G. Wood, Dr. Gordon, and others, and other authorities, that have already appeared in the BOY'S OWN PAPER. These are really the best of all on their respective subjects.

We must in the month of February remember that winter is still with us, and never weary in seeing after the poultry-run comforts. No leakage, please, through even the roof of your outdoor shelter; the dust-bath must be dust and not mud; no puddle out in the run; no mess left about to breed diarrhoea; ventilation in fowl-house imperative, but no nasty draughts to bring on colds and put the hens from laying; good food, especially for laying fowls. Do not forget that too much grain is fattening, and that fat fowls will not lay.

Of course your run will be clear long ago of all

wasters or supernumerary birds. Have an eye to utility, and keep nothing that will not keep itself and help to swell the credit side of your account-book.

You will be sitting fowls now. A warm nest is still required, but sprinkling of eggs, or the dipping of them for a second or two in warm water—which is often necessary in dry, warm weather—would at this season be useless, if not dangerous. Continue to feed chickens well if you are fortunate enough to have any, and look well after gallant cocks.

If you have not any fowls that want to sit, buy one or two, preferably from a neighbour, as during a long journey a fowl may change her mind and refuse to sit at all. Dorkings make good sitters, so do Cochins and Brahmas. Feed sitting hens well, and keep them warm.

THE PIGEON LOFT.—You will, like your brother the poultry-keeper, have nothing in your loft or garden pigeonry that is not thoroughly useful—nothing that is superfluous—nothing that will eat grain without the prospect of paying for it. It will be far too soon yet to mate, although some do so at the end of this month. We, however, deprecate hurry. Early hatching, unless a very mild spring follows, is very likely to result in weakly birds—if, indeed, you succeed in rearing them at all. Besides, the parent bird is more likely to become the victim of many troublesome and even fatal complaints in unpropitious weather, so take the Scotchman's advice, "Bide a wee and mak' siccar."

But you can make up your mind as to what you think best to mate. Do not forget that your birds must be young, and strong, and healthy, as well up in properties and points as possible. Remember also that you must not mate two faults together: thus if one bird is deficient in any particular property, the other must have it in perfection, else the progeny will not be worth much. Buy new stock only from the very best of strains. We repeat here—and we do not care how often we repeat it—that the only way to secure anything worth breeding from is to get it from a successful breeder and exhibitor; and the address can be obtained from the secretary of some past show by sending stamps for a prize catalogue. If you choose to buy your stock in Leadenhall Market, Seven Dials, or any grubby old birdshop whatever, you deserve to suffer, that is all. This hint should be taken by young breeders of all other kinds of live stock as well as pigeons. Well, now, be good enough to look over your loft and its arrangements, and see that not only is everything clean, dry, and tidy, but that you have all things necessary for the coming season. So may you have success.

THE AVIARY.—As with pigeons, so with canaries—there must be no hurry in mating. St. Valentine's Day, some may tell us, should see canaries mated. We give Punch's advice to people about to marry, and cry "Don't." But consider what breeds you are to go in for, unless you have done so long ago, and consider which pairs among these you should mate. Look for good points, and look for health, strength, boldness, and beauty. Do not let cages containing those you mean to mate hang together in the same room yet. If you have any superfluous stock, unless indeed it be old favourites or songsters, sell them or give them away. We hope you will soon have something much better to supply their place. Now we warn you that unless you have plenty of time on your hands, and plenty of common sense and brains in your head, not to bother with too many pairs. Two or three at most you will find amply sufficient. If you happen to have a deal of spare time, and a fair allowance of pocket-money, with an upper quiet room or attic at your disposal, you may go in for being a regular breeder; and if you have good stock to commence with—pedigree is essential—you may make money cent. per cent. of your expenditure.

See that everything is ready and clean, and all arrangements perfect for next month. If you are lucky enough to have an attic with a southern exposure, prepare it by thoroughly cleaning it and scouring the floor, for dust and dirt will assuredly breed disease.

THE RABBITRY.—Have you the back numbers of the BOY'S OWN containing our papers on rabbit-keeping? If not, you would profit by getting them. Everything laid down in these papers is practical and to the point. Prepare new hutches now, and if you mean to go in for a rabbit crop now would be the time, but you must be quick about it; the sooner it is ready the better. Mind that we believe—and we have large experience—that rabbits pay almost better than any other fancy.

THE KENNEL.—Keep warm and comfortable. If your dogs sleep at night in an outhouse that does not leak—here is a hint worth having—lay down the whole floor with dry peat mould, and put your bed of straw on top of that. Continue to feed your dogs well for the weather will still be cold, stormy, and inclement. Give plenty of exercise.

DOMESTIC PETS.—CATS (*continued*).—The ignorance that prevails almost universally about the treatment cats require is very deplorable, and the cruelties perpetrated on these harmless creatures are sad to think of. Never go from home and leave pussy shut up. Never forget to feed her and give her water and milk. Never keep more than two kittens, and do not keep them if you are not sure of a good home for them. We will tell you how to destroy cats in a humane manner in our DOINGS for April.

THE KITCHEN GARDEN.—If the weather is fine and the ground dry sow your seeds. Beds will not do well unless they have a fair allowance of manure and be exposed to the sunshine. Potatoes may also be got in, but it is time enough yet. Plant greens for summer crop; put in peas and broad beans. Tidy up all over, and down with every weed you see.

THE FLOWER GARDEN.—If you have put in all your bulbs and spring flowers in the end of the year, they will be now doing well; but for ordinary spring flowers it is not yet too late to plant. The season will soon be with us, so be prepared; the worst thing a gardener can do in February is to procrastinate.

THE WINDOW GARDEN.—Have you a hotbed in your garden? If not, make one. Any gardener will give you a lesson, or refer back to our papers on gardening. Sow and rear your annuals on this till ready for planting in your window-boxes, and you will have a beautiful show all the year round.

Correspondence.

H. B.—In Messrs. Crosby Lockwood's list you will find many books on estate management. You generally have to pay a premium as a farm pupil.

FUNGUS.—See answer to BOLETUS in No. 276. You would find Dr. M. C. Cooke's book on the Fungi of considerable use. Another manual is by Rev. M. J. Berkeley; and there are sheets of edible and poisonous mushrooms, with descriptions by Mr. Worthington Smith. All these books are procurable from W. H. Allen and Co., 13, Waterloo Place, who also publish Nare's "Collector's Handbook of Algae, Fungi, Lichens, etc.," price half-a-crown.

A LOVER OF NATURE.—Alleyne Nicholson's "Manual of Zoology," and Henfrey's "Botany," are the books you want. The first is published by Blackwood and Sons, the second by Van Voorst. Twelve shillings and sixpence or fifteen shillings is about the price of all such books. A handy book for studying the British flora is Messer's "British Wild Flowers by Natural Analysis," price half-a-guinea, published by D. Bogue, 3, St. Martin's Place, W.C.

W. MCK.—To take stains out of marble wash it with a mixture of finely-powdered pumice-stone and vinegar, and leave it for some hours. Then brush it hard and rinse it clean.

WELLS.—The population of Melbourne, with its suburbs, is 252,947; the city itself contains only 63,859. The population of Victoria is 862,346.

J. T. DAVIES.—You can hardly be a fireman until you have been on the water. The brigade is recruited from sailors, and you have little chance of joining it until you have had experience at sea.

ARRANDOON.—As you have learnt to swim from our articles, so you will find you will learn to float if you are not nervous. Of course you float more easily in salt water than fresh. The best diet for training is good solid food taken in moderation.

W. COWEN.—Coating brass with mercury is easily done. Clean the brass, and the mercury will stick on. At the same time do not run away with the idea that you have "silvered" the door-knob, or that you have improved it in any way. There is no connection whatever between silver and quicksilver, and you had far better leave the mercury alone.

W. J. B. and TELESCOPE.—The chief petty officers of the Royal Navy are head schoolmaster, master-at-arms, naval schoolmaster, writer, chief gunner's mate, chief boatswain's mate, chief captain of fore-castle, admiral's coxswain, chief quartermaster, chief yeoman of signals, chief carpenter's mate, chief stoker, engine-room artificer, ship's steward, ship's cook, and chief bandmaster. The warrant officers are the gunner, boatswain, and carpenter. For gallantry and daring warrant officers are eligible for promotion to the commissioned ranks, but the promotion is of very rare occurrence. A gratuity of a hundred pounds is given by the Admiralty to the officer so promoted, and a gratuity of twenty-five pounds is given to petty officers promoted to be warrant officers.

A. H. D.—A "Guide to the Medical Profession" is published by L. U. Gill, 170, Strand. It will give you all the particulars you require.

POLISHING.—One of the prize-winners in our recent competition informs us that hoofs can be purchased from any tripe-shop at a penny per pair.

L. E. PALMER (Melbourne).—The drawing of Australian beetles does you much credit, but the subject is not one of sufficient interest to the bulk of our readers. The outlines of the parts are not nearly detailed enough to guide a lithographer. The whole of the beetles we are able to copy from the Museum collection.

E. JENKINS.—Send to Messrs. Marion and Co., Soho Square, for price list of dry-plate cameras; or get a copy of the "Photographic News" or "Gazette," and consult the advertisements.

PLANET.—Yes, they are mostly printed, and procurable from French, bookseller, Strand.

BLUE BEANS.—Smart boy! How many blue beans make five? Well, write down blue like this—BLUE—and then knock away the foot of the L and the lower loop of the B and the curve of the upper loop, and you will get the FIVE, which gave rise to the saying. And that is the number you require.

HARDUP.—The best plan is to take the book to Mr. Quaritch, of Piccadilly, or some other of the high-class secondhand book dealers. If you advertise or sell it by auction they are the people who will buy it, and you might just as well go to them first as last. The value of a book depends so much on the edition and the binding that it is impossible to quote a price without a view. From your description we should estimate its value at eighteen-pence.

MACCLESFIELD.—Apply to Messrs. A. and C. Black, Edinburgh; or Messrs. Stanford, of Charing Cross, for list of their guide-books. Both firms have several that may suit you.

H. WALTON.—Hens lay soft eggs because they have not lime enough to peck at. Put a few chunks of old mortar within their reach. Poultry do not evolve calcic carbonate from the depths of their inner consciousness.

G. T. VINCENT, T. CLYDE, and Others.—You can get full particulars from the headquarters of the volunteer corps you wish to join. You can get a list of the London corps from the Post Office Directory.

A WOULD-BE TRICYCLIST.—1. The average speed of a tricycle on roads is about seven miles per hour. 2. A fairly good tricycle will cost you twenty pounds. 3. We have already treated the subject.

KOHLENMUNKPETER (St. Kilda).—1. A hot iron passed over the back will clear the plate from sticking. The stickiness is caused by the heat on the voyage. 2. St. Martin's-le-Grand is the Great St. Martin's, an old collegiate church on the site of the present Post Office, demolished when the monasteries were dissolved.

ONE PERPLEXED.—Apply for a prospectus to the nearest school in connection with the Science and Art Department, and see if you cannot manage to attend one of the courses of lectures, go up for examination, and pass in honours.

C. G. CRICK.—1. Get the October part for 1882, and read about the launch of the lifeboats for yourself. 2. Yes. You should watch the paper.

A. L.—A hectare is ten thousand square metres, or 2 4711431 acres.

ANXIOUS ENQUIRER.—Boys before the mast—that is, ordinary sailor boys—have to pay no premium, but must find their own clothes. The only plan is to go to the Mercantile Marine Office at one of the principal ports, and get employment through the superintendent. Never speak of your intention to go to sea to any one outside the office unless he has the Board of Trade mark on his cap. There is now a special Government department to look after such matters, and the officers are employed to prevent your being cheated. The "Life on the Ocean Wave" articles can only be had in volume form, price seven shillings and sixpence. Get Mr. Thomas Gray's "Under the Red Ensign," from Kent and Co., or any publisher, price one shilling. In its latest edition it is the recognised guide on "going to sea."

C. HADEN.—There are several shilling books on mixing colours, procurable from Simpkin, Marshall, and Co., with titles such as the "Painter and Grainer," "Painting Guide," etc. Try Brodie and Middleton, Long Acre, for a copy. The second series of "Workshop Receipts," published by Spon and Co. at five shillings, contains a good deal of information on the manufacture.

J. H. K.—Coat your pencil drawings with milk or a thin solution of collodion. This will prevent their getting rubbed.

G. H.—An inquiry of Goy, Leadenhall Street, would give you price and easiest terms. Canadian canoes cost from ten to twenty pounds.

J. MCNEILL.—The mixture of size and whiting applied to wood previous to water-gilding is to give a smooth surface for the work. The proportion must vary with the size, but the mixture should be about as thick as cream. Air-bubbles in laying on can be prevented by your always working in one direction.

J. E. K.—You will find an article on Rounders in the first monthly part of the third volume. The game described is the ordinary one played with the stick.

C. J. I.—We really cannot oblige you. Any copy you want will be sent by the publisher on application to him enclosing stamps, but the number must be distinctly stated. The editorial department has nothing whatever to do with the sale of the paper. As we have already stated in these columns, we cannot guarantee an answer to any question, and we cannot undertake to forward copies of the issue in which the answer may appear.

NEMO.—1. The patterns and colours of the stamps are frequently changed in order to render forgeries as difficult as possible. 2. We do not find the abbreviation J. J. in any list. Perhaps it is a misprint for S. J.—Society of Jesus.

CLAUDIAN AURELIAN.—1. The population of Portsmouth in 1831 was 127,959. 2. In Edwardian days. 3. The coin is called a sovereign from its bearing the monarch's portrait.

WINTER.

"He giveth snow like wool."—(Ps. cxlvii, 16.)

No. 318.—Vol. VII.

SATURDAY, FEBRUARY 14, 1885.

Price One Penny.

IVAN DOBROFF:

A RUSSIAN STORY.

BY PROFESSOR J. F. HODGETTS,

*Late Examiner to the University of Moscow, Professor
in the Roman Imperial College of Practical
Science, etc.,*

Author of "Harold, the Boy-Earl," etc.

CHAPTER XI.—THE MONASTERY.

THE delight of Ivan at finding himself again encased in the masculine garments to which he attached such importance was too great for description, while Von Steinfeldt led the way in silence, wondering whether he was doing right to mix himself up in the matter at all.

He was a proud man, and dreadfully afraid of compromising himself in any way. Yet now he found himself hopelessly compromised all round. If he sheltered Ivan he was running counter to the law; if he gave him up to the authorities he was giving up his wife's family, so to speak, to disgrace.
